NEMORENSIS LACUS (mod. *Nemi*), a lake in the Alban hills, in an extinct subsidiary crater in the outer ring of the ancient Alban crater, east of the Lake of Albano. It is about 3½ m. in diameter and some 110 ft. deep; the precipitous slopes of its basin are over 300 ft. high, and are mainly cultivated. In ancient times it was included in the territory of Aricia and bore the name "Mirror of Diana." The worship of Diana here was originally celebrated with human sacrifices; even in imperial times the priest of Diana was a man of low condition, a gladiator or fugitive slave, who won his position by slaying his predecessor in fight, having first plucked a mistletoe bough from the sacred grove. The temple itself was one of the richest in Latium; Octavian borrowed money from it in 31 B.C. The remains of its precinct are situated a little above the level of the lake, on the north-east—a large platform, the back of which is formed by a wall of concrete, with niches, resting against the cliffs Excavations (now covered in again) led to the discovery of the temple itself, a comparatively small building, 98 by 52 ft., containing objects, none earlier than the 4th century B.C. A road descended to it from the Via Appia from the south-west. The lake is drained by a tunnel of about 2 m. long, of Roman date.

On the west side of the lake remains of two ships (really floating palaces moored to the shore) have been found, one belonging to the time of Caligula (as is indicated by an inscription on a lead pipe), and measuring 210 ft. long by 66 wide, the other even larger, 233 by 80 feet. The first was decorated with marbles and mosaics, and with some very fine bronze beamheads, with heads of wolves and lions having rings for hawsers in their mouths (and one of a Medusa), now in the Museo delle Terme at Rome. Various attempts have been made to raise the first ship, from the middle of the 15th century onwards, and the ancient emissarium has now been cleared in order to lay bare the remains of the ships. Caesar had a villa constructed there.

NEMOURS, LORDS AND DUKES OF. In the 12th and 13th centuries the lordship of Nemours, in Gâtinais, France, was in possession of the house of Villebeon, a member of which, Gautier, was marshal of France in the 13th century. The lordship was sold to King Philip III. in 1274 and 1276 by Jean and Philippe de Nemours, and was then made a county and given to Jean de Grailly, captal de Buch in 1364. In 1404 Charles VI. of France gave it to Charles III. of Evreux, king of Navarre, and erected it into a duchy in the peerage of France (*duché-pairie*). Charles III.'s daughter, Beatrix, brought the duchy to her husband Jacques de Bourbon, count of La Marche, and by the marriage of their daughter, Eleanor, to Bernard of Armagnac, count of Pardiac, it passed to the house of Armagnac. The duchy reverted to the French crown in 1505, after the extinction of the house of Armagnac-Pardiac. In 1507 it was given by Louis XII. successively to his nephew, Gaston de Foix (d. 1512), Guiliano de Medici and his wife Philiberta of Savoy in 1515, to Louise of Savoy in 1524, and to Philip of Savoy, count of Genevois, in 1528, whose descendants possessed the duchy until its sale to Louis XIV. In 1572 Louis gave it to his brother Philip, duke of Orleans, whose descendants possessed it until the Revolution. The title of duc de Nemours was afterwards given to Louis Charles, son of King Louis Philippe, who is dealt with separately below.

The following are the most noteworthy of the earlier dukes of Nemours.

James of Armagnac, duke of Nemours (*c.* 1433–1477), was the son of Bernard d'Armagnac, count of Pardiac, and Eleanor of Bourbon-La Marche. As comte de Castres, he served under Charles VII. in Normandy in 1449 and 1450, and in Guienne. Louis XI. loaded him with honours, married him to his god-daughter, Louise of Anjou, and recognized his title to the duchy of Nemours in 1462. Sent by Louis to pacify Roussillon, Nemours felt that he had been insufficiently rewarded for the rapid success of this expedition, and joined the League of the Public Weal in 1465. The king's patience eventually became exhausted by his intrigues; his château at Carlat was attacked, and he was condemned by the parlement, and beheaded on Aug. 4, 1477.

See B. de Mandrot, *Jacques d'Armagnac, duc de Nemours* (1890).

Charles Emmanuel (1567–1595), son of James, duke of Nemours and Anne of Este, widow of Francis, duke of Guise, was called in his youth prince of Genevois. Involved in political intrigues by his relationship with the Guises, he was imprisoned after the assassination of Henry, duke of Guise, and his brother the cardinal of Lorraine, in 1588, but escaped. He was governor of Paris when it was besieged by Henry IV. After quarrelling with his half-brother Charles of Lorraine, duke of Mayenne, he withdrew to his government of Lyonnais, where he endeavoured to make himself independent. He was imprisoned, however, in the château of Pierre-Encise by the archbishop of Lyons. After his escape he attacked Lyons, but was defeated owing to the intervention of the constable de Montmorency. He died at Annecy in July 1595.

His brother Henry (1572–1632), called originally marquis de Saint-Sorlin, succeeded him as duke. In 1588 he took the marquisate of Saluzzo from the French for his cousin, the duke of Savoy. The princes of Guise, his half-brothers, induced him to join the League, and in 1591 he was made governor of Dauphiné. He made his submission to Henry IV. in 1596. After quarrelling with the duke of Savoy he joined the Spaniards in their war against Savoy. After peace had been proclaimed on Nov. 14, 1616, he retired to the French court. He died in 1632, and was succeeded by his eldest son, Louis, and on the death of the latter in 1641 by his second son, Charles Amadeus (1624–1652), who served in the army of Flanders in 1645, and in 1646 commanded the light cavalry at the siege of Courtrai. In 1652 he took part in the war of the Fronde, and was wounded at the Faubourg St. Antoine. On July 30, 1652, he was killed in a duel by his brother-in-law, François de Vendôme, duke of Beaufort. He had two daughters, Marie Jeanne Baptiste (d. 1724), who married Charles Emmanuel of Savoy in 1665; and Marie Françoise Elisabeth, who married Alphonso VI., king of Portugal, in 1666. His brother Henry (1625–1659), archbishop of Reims, withdrew from orders and succeeded to the title.

In 1657 Henry married Marie d'Orleans-Longueville (1625–1707), daughter of Henry II. of Orléans, duke of Longueville. This duchess of Nemours is a famous personage. At an early age she was involved in the first Fronde, which was directed by her father and her stepmother, Anne Geneviève de Bourbon-Condé, the celebrated duchesse de Longueville; and when her husband died in 1659, leaving her childless, her life was mainly spent in contesting her inheritance with her stepmother. She left some interesting *Mémoires,* which are published by C. B. Petitot in the *Collection complète des mémoires* (1819–1829).

NEMOURS, LOUIS CHARLES PHILIPPE RAPHAËL, Duc de (1814–1896), second son of the duke of Orleans, afterwards King Louis Philippe, was born on Oct. 25, 1814. In 1830 he became a chevalier of the order of the Saint Esprit and entered the chamber of peers. As early as 1825 his name was mentioned for the throne of Greece, and in 1831 he was elected king of the Belgians, but Louis Philippe declined the honour for his son. In Feb. 1831 he accompanied the French army which entered Belgium to support the new kingdom against Holland, and took part in the siege of Antwerp. He accompanied the Algerian expeditions against the town of Constantine in the autumn of 1836, and again in 1837, taking it by assault on Oct. 13. He sailed a third time for Algeria in 1841, and served under General Bugeaud. On his return to France he became commandant of the camp of Compiègne. He had been employed on missions to England in 1835, 1838 and 1845, and to Berlin and Vienna in 1836. His marriage in 1840 with Victoria, daughter of Duke Ferdinand of Saxe-Coburg, was marked by a check to Louis Philippe's government in the form of a refusal to bestow the marriage dowry proposed by Thiers in the chamber of deputies. The death of his elder brother, Ferdinand, duke of Orleans, in 1842 gave him a position of greater importance as the natural regent in the case of the accession of his nephew, the young count of Paris, but he was not popular. On the outbreak of the revolution of 1848 he held the Tuileries long enough to cover the king's retreat, but took no active measures against the mob. He followed his sister-in-law, the duchess of Orléans, and her two sons to the chamber of deputies, but was separated from them by the rioters, and only escaped in the uniform of a national guard. He then settled with his parents in England. His chief aim was a reconciliation between the two branches of the house of Bourbon, as indispensable to the re-establishment of the French monarchy in any form. These wishes were frustrated on the one hand by the attitude of the comte de Chambord, and on the other by the determination of the duchess of Orléans to maintain the pretensions of the count of Paris. Lengthy negotiations ended in 1857 with a letter, written by Nemours, in which he insisted that Chambord should adhere to the tricolour flag and to the principles of constitutional government.

Nemours had lived at Bushey House after the death of Queen Marie Amélie in 1866. In 1871 the exile imposed on the French princes was withdrawn, but he only returned to Paris after their disabilities were also removed. In March 1872 he was restored to his rank in the army as general of division, and placed in the first section of the general staff. In 1881 new decrees against the princes of the blood led to his withdrawal from Parisian society. He died at Versailles on June 26, 1896, the duchess having died at Claremont on Nov. 10, 1857.

See R. Bazin, *Le Duc de Nemours* (1907); Paul Thureau-Dangin, *Histoire de la monarchie de juillet* (4 vols., 1884, etc.).

NEMOURS, a town of France, in the department of Seine-et-Marne, on the Loing and its canal, 26 mi. S. of Melun, by rail. Pop. (1936) 4,942. Nemours derives its name from the woods (*nemora*) in which it formerly stood, and discoveries of Gallo-Roman remains indicate its early origin. It derives its historical importance from the lordship of Nemours.

NENADOVIĆ, MATEYA (1777–1854), Serbian patriot, was born in 1777. He is generally called Prota Mateya, since as a boy of 16 he was made a priest, and a few years later became archpriest (Prota) of Valyevo. His father, Alexa Nenadović. *Knez* (chief magistrate) of the district of Valyevo, was one of the prominent Serbs murdered by the Janissaries of the Belgrade Pashalik to intimidate the people (1804). The result, on the contrary, was a general popular rising. Prota Mateya became the deputy-commander of the insurgents of the Valyevo district, but soon exchanged this post for that of chief diplomatic envoy of the insurgents. In the years 1814–15 he visited Vienna to plead the cause of Serbia to the Congress. Prota Mateya's memoirs are the most valuable authority for the history of the first and second Serbian wars of independence. The best edition is that of the Serbian Literary Association in Belgrade (1893).

NENAGH, a town of co. Tipperary, Eire, near the river Nenagh, 96½ mi. S.W. from Dublin by the Ballybrophy and Limerick branch of the Great Southern railway. Pop. (1936) 4,902. Of the old castle, Nenagh Round, dating from King John, there still exists the circular donjon or keep. There are no remains of the hospital founded in 1200 for Austin canons, nor of the Franciscan friary, founded in the reign of Henry III. Nenagh was one of the ancient manors of the Butlers, who received for it the grant of a fair from Henry VIII. In 1550 the town and friary were burned by O'Carroll. In 1641 the town was taken by Owen Roe O'Neill, but shortly afterwards it was recaptured by Lord Inchiquin. It surrendered to Ireton in 1651, and was burned by Sarsfield in 1688.

NENNIUS (*fl.* 796), a Welsh writer to whom we owe the *Historia Britonum*, wrote in Brecknock or Radnor. His work exists in 30 manuscripts, the earliest of which is not much earlier than the year 1000. All are defaced by interpolations which give to the work so confused a character that critics were long disposed to treat it as an unskilful forgery. A new turn was given to the controversy by Heinrich Zimmer, who, in his *Nennius vindicatus* (1893), traced the history of the work and, by a comparison of the manuscripts with the 11th-century translation of the Irish scholar, Gilla Coemgim (d. 1072), succeeded in stripping off the later accretions from the original nucleus of the *Historia*. Zimmer follows previous critics in rejecting the *Prologus maior* (§§ 1, 2), the *Capitula*, or table of contents, and part of the *Mirabilia* of the concluding section. But he proves that Nennius is the compiler of the *Historia* proper (§§ 7–65). The only part of the *Historia* which deserves to be treated as a historical document is the section known as the *Genealogiae Saxonum* (§§ 57–65). This is merely a recension of a work composed *c.* 679 by a Briton of Strathclyde. The author's name is unknown; but he is, after Gildas, our earliest authority for the English conquest of England. Nennius himself gives us the oldest legends relating to the victories of King Arthur; the value of the *Historia* from this point of view is admitted by the severest critics. The chief authorities whom Nennius followed were Gildas' *De excidio Britonum*, Eusebius, the *Vita Patricii* of Murichu Maccu Machtheni, the *Collectanea* of Tirechan, the *Liber occupationis* (an Irish work on the settlement of Ireland), the *Liber de sex aetatibus mundi*, the chronicle of Prosper of Aquitaine, the *Liber beati Germani*. The sources for his notices of King Arthur (§ 56) are unknown.

See J. Stevenson's edition of the *Historia Britonum* (English Hist. Soc., 1838), based on a careful study of the mss.; A. de la Borderie, *L'Historia Britonum* (Paris and London, 1883), which summarizes the older negative criticism; H. Zimmer, *Nennius vindicatus* (Berlin, 1893); T. Mommsen in *Neues Archiv der Gesellschaft für ältere deutsche Geschichtskunde*, xix. 283. (H. W. C. D.)

NEODYMIUM, the third commonest metallic element belonging to the rare-earth group (symbol Nd, atomic number 60, atomic weight 144·3), was discovered by von Welsbach in 1885 when he split "didymium" into praseodymium and neodymium. This metal occurs along with cerium, lanthanum, praseodymium, etc., in the minerals monazite, cerite, allanite, etc. It is best prepared by the fractional crystallisation of the double magnesium nitrate from water. The oxide, Nd_2O_3, is usually obtained as a light blue powder, but traces of praseodymium give it a yellow-brown tint. The oxide is rapidly dissolved by hydrochloric and nitric acids, giving amethyst solutions which show a very intense and characteristic absorption spectrum. The metal is prepared by the electrolysis of the fused anhydrous chloride, $NdCl_3$. It slowly oxidizes in air and is gradually attacked by cold water. It melts at 840° C. (*See* RARE EARTHS.) (C. J.)

NEOGNATHAE, the term now used in ornithology (*q.v.*) instead of the older term Carinatae (*q.v.*) to denote the section of the class Aves to which the majority of modern birds belong.

NEO-GREC, in architecture and the allied arts, a style developed in the second quarter of the 19th century in France, in which an attempt was made to instil into generally classic design a spirit at once modern, original and yet full of the restraint, delicacy and perfection of Greek details. It was largely the result of the efforts of three men—J. Duban, H. Labrouste and L. Duc. It found its most complete expression in Paris, especially in the Colonne de Juillet (1831–40) by Duc; the Library of S. Geneviève (1843–50) by Labrouste; the École des Beaux Arts (1820–39) by Duban; and the west wing of the Palais de Justice (1857–68) by Duc. The style is important, less for these complete works, than for its tremendously widespread influence throughout the middle of the 19th century, not only in Europe, but also in America. Its chief characteristics are modified orders; imaginatively modernized classic detail; much use of simple, flat surfaces, often with chamfered edges; pediment forms without horizontal cornices; and delicate, refined, incised ornament.

NEO-HEGELIANISM. For a decade or a decade and a half after 1860 the history of British and American philosophy is the story of a growing revolt against the empirical method of John Stuart Mill and his school. The movement might have died had it not found something positive to feed upon. But it happened that a wide field of historical thought, largely unexplored by English thinkers, was there for it to turn to, namely, the German philosophy of the opening of the century, both the "criticism" of Kant and the idealistic continuation of Kantianism by Fichte, Schelling and Hegel; and "Neo-Hegelian" is the epithet attached, largely against their will, to the English group who gave the lead in this direction.

Of course no one can be prevented from using the word in other senses. Good precedent can be quoted for applying it indifferently to any revived interest in idealistic ways of thinking occurring in any country since the time of Hegel. The strongest instance in favour of an extension of meaning is the Croce-Gentile school, the most noteworthy product of contemporary thought in Italy. But on the one hand the Italian declarations of independence whenever Neo-Hegelianism is imputed to them have been so emphatic that it is hard for the historian to persist in calling them by the name; and on the other hand custom certainly sanctions the position adopted here, that Neo-Hegelianism used as a quasi-technical term is normally applied to a movement in the recent history of Anglo-Saxon thought. Perhaps the readiest conspectus of the movement will be had by treating it under two heads: its historical background and its essential teaching.

Its Historical Background.—It is important to distinguish the historical setting of the Neo-Hegelian thinkers, which is British, from the story of German thought which bulks most largely in their own account of their historical setting. The latter is a chapter in what they saw, the former yields the reason for their seeing it.

As is well known the scepticism of David Hume provoked a native Scottish reply as well as a German one. This, descending through Reid and Hamilton to Calderwood, Ferrier, Fraser and others in the 19th century set up an independent movement towards idealism which by 1860 had become pronounced especially in Scottish philosophy.

But important as it is for the historian to recognize how the Neo-Hegelian thinkers were thus provided with a reception in advance, it is even more important to consider the historical place in which they saw themselves to be standing, namely, the Kantian succession. When Kant came on the philosophical stage he found philosophy at an impasse. It was precisely the impasse to which they believed the doctrines of the empiricists Mill, Bain, Lewes, Spencer and others had brought it back. The work of Kant had been to examine the assumptions which led philosophy thither; and they held that further progress was impossible until the principle of the Kantian criticism was understood.

When Kant called attention to knowledge his interest was centred upon that which knowledge discloses, the "Nature" with which man is conversant in science and in everyday experience. There were two obvious features of it. First, its constituents were not things as they are in themselves but things as they appear to the human senses. Secondly,—and this was his problem—these appearances were not disconnected sensations. They had a certain order. They displayed themselves before us as objective. Kant asked how such objectivity was possible; and his answer consisted in saying that there was a logic of the process. The original use of the understanding whereby it arranged those appearances as an orderly world proceeded according to a logic which Kant distinguished as synthetic from the traditional formal or analytic logic, and which he called transcendental.

The idealistic successors of Kant—Fichte, Schelling and Hegel—saw in the critical philosophy a principle of reconciliation. The gulf fixed for common sense between mind and the world could be bridged. Kant had bridged it only imperfectly, leaving as he did things-in-themselves quite as much cut off from mind as the objects of common sense seemed to common sense to be. The post-Kantians sought, each in his own way, to bring the wheel full circle. Their instrument, with whatever differences, was still Kant's instrument, logic, the new "transcendental" logic, the logic of synthesis whereby the world is put together, as distinct from the formal analytic logic of the Aristotelian tradition. As

Hegel takes it over this logic has suffered two changes. It has ceased to be a mere theory of thought and become a theory of being; and it has learnt to move by dialectical procession. So reconstituted, logic emerges as an abstract version of the literal process by which the absolute spirit reveals itself as the universe, by dint of breaking forth into all the forms which the universe wears to human consciousness, nature, history, society, art, religion.

The dominion which his principle gave to Hegel over intellectual Europe at the beginning of the 19th century is one of the romances of philosophical history. There were three impressive features of him and his system. First, here was a thinker with apparently sufficient range to confront the entire field of man's then recorded experience of himself and the universe; in the second place he seemed to succeed in throwing whole territories of experience for the first time into some sort of order; and thirdly—the really remarkable circumstance—these results precipitated themselves in obedience to the assumption that the universe was the expression of spirit. It may be difficult to account for the currency of these beliefs about Hegel, but granted their currency there is nothing surprising in the impression he made.

Its Essential Teaching.—The mere existence of the Hegelian *corpus* doubtless touched the imagination of the Neo-Hegelian thinkers. It was there to show what a spiritual view of the world could be; and its presence helped to temper their disbelief in its particulars with a general belief in the possibility of "something of the kind." None of them were disciples in the way in which the original Hegelians had been. Green, more sensitive than most others to the error in some of Hegel's substantial results, even mistrusted the method by which they were obtained. To the Neo-Hegelians, Hegelianism was powerful as criticism. Green in particular was convinced by the critical regress which shows self-consciousness to be the only starting point for philosophy. He sets forth the argument in his *Prolegomena to Ethics* published posthumously in 1883 (5th ed. 1906).

This is one of the important works of the school. It is initially a constructive criticism of the empirical standpoint in ethics, its interest being to show the impossibility of either, with materialism, deriving self-consciousness from something other than itself or, with hedonism, defining the moral end by reference to something other than itself. Against the objection, almost inevitably arising, that Green is here eliminating the possibility of a logical or rational account of these matters at all, there is but one resource. It is to inquire what logic is and how far the new meaning which Kant threw into it is defensible.

Neo-Hegelianism is thus at heart a logical doctrine, and Bosanquet, whose *Logic* (1896, 2nd ed. 1911) together with Bradley's *Principles of Logic* (1883, 2nd ed. 1922) may be said to provide the technique of the whole way of thinking, expresses the spirit of it equally accurately and simply when he suggests that a colour-harmony may have logical necessity as well as a syllogism. The logic which permits such a saying is a logic of coherence. Stress upon coherence is a leading feature of Bosanquet's mind and writing. He does not, in vindicating his general position, press upon his reader the logical compulsiveness of the Kantian starting-point as Green does. He is content to exhibit the coherence which comes into our view of things when we decide to read the universe in the light of our highest experiences in it. Only in those is the coherence of the world revealed to us. And when we see how it coheres we see it as it is.

In the logical doctrine of coherence a metaphysical doctrine is involved, that of "degrees of reality." What we call our "highest" experiences occur only intermittently; and they suggest rather than express what is meant by coherence. As will, I seek the good; I rarely if ever actually find it in realizing the social will. On the other side, as intelligence, I seek the true; I shall only comparatively seldom find it in the propositions which were supremely important to my human nature as it is. None the less these rare experiences are those showing reality, giving reality in proportion as they are full and unqualified. This coincidence of reality with what man encounters when "at his fullest stretch" is the theme of the two volumes of Gifford Lectures in which Bosanquet's long term of philosophical activity culminates, *The Principle of Individuality and Value* (1912, 2nd ed. 1927) and *The Value and Destiny of the Individual* (1913, 2nd ed. 1923).

But since man is not always at his fullest stretch, and since what he encounters and experiences in his casual moods must also be real, a doctrine of grades or degrees of reality is involved. This vital implication of Neo-Hegelianism is bared to the bone only in the metaphysical essay by F. H. Bradley, *Appearance and Reality* (1893, 8th impression, 1925) usually allowed to be the greatest work emanating from the Neo-Hegelian school.

Bradley argues for one ultimate system of experience which is reality, and shows that nothing finite is real taken as it stands. For reasons equally compelling, however, he must insist that the finite is real somehow. "Anything that in any sense 'is' qualifies the absolute reality and so is real." The solution of the antinomy lies in the relativity of everything finite. No exception to this law offers itself. "There is no mere appearance or utter chance or absolute error, but all is relative." The absolute or infinite experience, therefore, which logically must be, can in fact be; and so we are entitled to say that it is. The absolute is vindicated and the finite defended through the admission of degrees in truth and reality.

Bradley's essay made history both within the school and without. All three features of the finite stressed by him, the defects which condemn it, the "relativity" which suggests salvation for it and the absolute in which it is saved, bit into contemporary thought. For example, both his line of attack upon the finite and his line of defense brought mathematics and physics into the idealistic argument. Apropos of his line of defense, we find the "relativity" of recent mathematical theory regarded by Viscount Haldane as a particular case of the general principle of relativity involved in the idealistic construction of experience. Apropos of his attack, we find Royce reducing all Bradley's charges against the finite to one, namely that it involves an infinite regress; and, thinking the very possibility of idealism to be at stake, he evolves a mathematical counterargument. Besides bringing up mathematical argument in defense of idealism, Bradley's dialectical attack on the finite also provoked mathematical resistance. This came from Russell and the realists. Curiously enough it took exactly the same form, a defense of the finite against the charge of involving an infinite regress of a self-contradictory kind. Still deeper was the bite of the Bradleian absolute. Intended by him as the saviour of the finite, it was everywhere taken as annihilating it. It, in consequence, drew upon itself almost the whole resistance of a generation to that conception of a quiescent absolute, to which the western mind seems constitutionally averse. Thus it generated Pragmatism in England, and played a great part in differentiating such Neo-Hegelianism as appeared in the United States from the English type.

The earliest Neo-Hegelian influences which reached the U.S. found, as in England, an idealism already there, one derived largely from the same Scottish sources. There were such teachers as Noah Porter of Yale and Thomas McCosh of Princeton. A channel through which the Neo-Hegelian interest in the U.S. found important expression was the *Journal of Philosophical Studies,* edited by W. T. Harris (1835–1909) of St. Louis, Mo.

The note of U S. idealism is its solicitude for personality and the individual. This is conspicuous in Howison and still more where the influence of Lotze was stronger, as in Bowne. The feature of Royce's central work, *The World and the Individual* (1901), is its combination of a doctrine of the absolute with a doctrine of the unique individual. The substance of reality is experience, and every finite idea of which it is composed has an "internal meaning" embodying a purpose which, in the absolute, is fulfilled. The absolute is needed in order that all ideas may reach fulfilment, both those within the experience of individuals and those beyond.

Royce's absolutism can hardly be said to have survived as a school. Yet it would be untrue to say that in the United States the idealism which recognizes an absolute has merely disappeared, leaving its empty room to be divided between a pragmatism which emphasizes human values and a realism which thirsts for facts There are signs of a younger idealistic thought ambitious to vindicate the absolute realistically by touching it, so to speak, at the very nadir of fact, through the perception that all knowledge of objects is necessarily also a revelation of subject, and therefore a traffic with mind. On some such assumption seems to rest the work of W. E. Hocking (*The Meaning of God in Human Experience,* 1912), and it is possibly in a note such as this, not without its echoes on both sides of the Atlantic, that the eventual issue of the Neo-Hegelian incident in the history of philosophy is to be discerned.

NEO-KANTIANISM. The philosophical movement called Neo-Kantianism commenced in Germany in the 1860s. Beginning with certain epistemological inquiries, it extended gradually over

the whole field of philosophy. The individual thinkers who belong to this movement differ from each other in their interpretation of the Kantian doctrine as well as in the results which they reach from the Kantian premises. But, notwithstanding differences of detail, there is a certain methodical principle common to all of them. They all see in philosophy not merely a personal conviction, an individual view of the world, but they inquire into the possibility of philosophy as a science with the intention of formulating its conditions. They take their cue from the most general statement of the Kantian problem in the preface to the *Critique of Pure Reason* and in the *Prolegomena*. But in returning to the fundamental aim of Immanuel Kant, to lead philosophy "into the safe road of a science," Neo-Kantianism finds itself confronted with a new task inasmuch as it must face a different state of science itself.

Helmholtz.—The first decisive impetus toward the reception and revival of Kant's fundamental ideas started within the circle of natural science itself. Hermann von Helmholtz' particular mentality and his significance for the development of natural science in the 19th century are determined by the fact that he was both a physicist and a physiologist. His main work, the *Handbuch der physiologischen Optik* (1856; 3rd ed., 1909–11), shows both methods of inquiry in their mutual interdependence and ideal union. Here the fundamental problem of Kant's *Transcendental Aesthetics,* the question of the epistemological significance of space and spatial perception, is emphatically restated. For the solution of this question, Helmholtz goes back to the researches and results of Johannes Müller in the field of the physiology of the senses.

In his *Vergleichende Physiologie des Gesichtssinns* (1826), Müller had developed the doctrine of the "specific energy" of sense organs; he had shown that the quality of the individual sense data—the constitution of colour, tone, smell, etc.—is not to be explained from the constitution of the external stimulus, but from the peculiarity of the organ that conveys the sensation. This result is taken up by Helmholtz in his lecture *Über das Sehen des Menschen* (1855) and interpreted as an empirical confirmation of that which Kant had determined by general a priori considerations. The true and permanent achievement of Kantian philosophy, according to this interpretation, consists in having shown the participation of the innate laws of the mind in the formation of our ideas.

This interpretation was accepted by contemporary philosophers, especially by Friedrich Albert Lange (1828–1875). Lange, in his *History of Materialism* (1866), propounds as the essence of Kantian philosophy the proposition that what we call the "reality" of things is in truth nothing but their "appearance for the human species." Thus, the concept of causality, for instance, being rooted, according to this theory, in our psychophysical organization, is prior to all experience, an a priori disposition of the human mind. Accordingly, it has within the field of human experience unlimited validity; but beyond this no significance whatever. By extending this interpretation to all parts of the Kantian system, Lange arrives at the conclusion that not only is the concept of the "thing-in-itself" the "concept of a perfectly problematical something" having significance only as a "limiting term" (*Grenzbegriff*), but that even the "intelligible world," which was used by Kant as the foundation of ethics, is a "world of poetry." This poetry, to be sure, is, according to Lange, "a necessary fruit of the mind, issuing from the inner and most vital roots of the species." But in this very implication, which threatened to transform the Kantian transcendental idealism into a fictionism of the type developed later by Vaihinger, the deficiencies of the empirico-physiological interpretation of Kantian apriorism became clearly apparent.

Zeller.—In the meantime, the attempt had already been made in German philosophy to put Kantian apriorism on a basis broader and more solid than that which the doctrine of the specific energy of sense organs was capable of affording. In a lecture which Eduard Zeller had delivered in the year 1862 as an introduction to his course on logic and epistemology in Heidelberg, he had pointed out that epistemology formed the formal basis of philosophy as a whole, that it was epistemology "from which the final decision on the correct method in philosophy and science generally had to come." Hegel's *Wissenschaft der Logik* and his *Phänomenologie des Geistes* had been the last grandiose attempts to comprise the whole of knowledge in its content and to develop it constructively from one unifying idea. Zeller tries to show that the attempt did not reach its goal and could not reach it, "because it overlooks the conditions of human knowledge, for it purports to grasp with one swoop from above the ideal of knowledge which, in reality, we can approach only gradually through complicated labour from below" But the magic circle of the Hegelian system—so he says—will not allow itself to be broken, so long as the presuppositions of the latter are not investigated anew and more thoroughly than before; and this very investigation necessarily leads back to Kant.

What is here expressed as a purely programmatic idea, Otto Liebmann (1840–1912) tried to carry out in his main philosophical writings. The very first of Liebmann's writings, *Kant und die Epigonen* (1865), attempts to show that the successors of Kant all missed the way which he had clearly recognized and indicated. In an intensive criticism of the "idealistic," the "realistic" and the "empirical" tendencies of post-Kantian philosophy, Liebmann tries to point out that all these movements—the system of Fichte, Schelling and Hegel, as well as the systems of Herbart, Fries and Schopenhauer—suffer from a common fault. They all assign to the concept of the "absolute" or of the "thing-in-itself" a central place and make it the fundamental concept of metaphysics, whereas Kant's doctrine, if rightly understood and further developed, implies the very opposite, namely, that this concept is a nonconcept, that all cognition moves within the realm of mere relationships, but can never grasp or positively determine an "absolute."

Hermann Cohen.—However, it was only in Hermann Cohen (1842–1918) that neo-Kantianism reached its climax. In his three great works on Kant, *Kants Theorie der Erfahrung* (1871; 2nd ed., 1885), *Kants Begründung der Ethik* (1877; 2nd ed., 1910) and *Kants Begründung der Aesthetik* (1888), Cohen gave for the first time a critical interpretation of the entire Kantian system which, with all its penetration into the specific detail of Kant's fundamental doctrines, sets, nevertheless, one single systematic idea into the centre of the investigation. This idea is that of the "transcendental method."

From Friedrich Albert Lange, with whom Cohen was closely connected by ties of personal friendship, Cohen differs especially in that he rejects any psychological interpretation of Kant's apriorism, any explanation of the a priori by the "psychophysical organization" of man.

In his study *Das Prinzip der Infinitesimal Methode und seine Geschichte* (1883) he tries to prove that the concept of the "infinitely small," as it was established in the Leibnizian differential calculus and in the Newtonian calculus of "fluxions," is, at the same time, the indispensable and basic intellectual means for any scientific cognition of "reality." Reality is never "given" in any sense, neither in sensation nor in mere intuition, but it must be produced by means of pure thought. The various ways and directions in which thought moves in this "production of the object" are the problems which logic has to trace. This idea found its development in Cohen's main systematic work, the *Logik der reinen Erkenntnis* (1902; 2nd ed., 1914), to which were added, as a second and third part of his system of philosophy, the *Ethik des reinen Willens* (1904) and the *Aesthetik des reinen Gefühls* (1912).

Natorp.—In closest personal and scientific contact with Cohen, Paul Natorp (1854–1924) further pursued and carried out the fundamental methodical idea of "critical idealism." For him, too, the object of knowledge is not given in itself as a ready-made thing, but "becomes" only in the eternal process of knowing, in a constantly renewed production of objects. This process never lies completed before us, as a firm and final result, an "absolute" in the dogmatic-metaphysical meaning of the term; it is, however, possible to recognize the direction in which it moves, the general form of the production of the object. Natorp developed this main idea of his theoretical philosophy especially in his study *Die logischen Grundlagen der exakten Wissenschaft* (1910) and in a more concentrated survey in the essay *Philosophie, ihr Problem und ihre Probleme* (1911). Of special importance, furthermore, is his *Allgemeine Psychologie nach kritischer Methode* (1912), which established an entirely new view of its aim and method and anticipated in decisive points Edmund Husserl's phenomenology.

Riehl.—Cohen's insistent reference to the doctrine of Kant as the basis of all scientific philosophy and his account of the "transcendental" had a great effect even on thinkers who ultimately differed from Cohen in the conception of the critical system. Thus, for instance, the main work of Alois Riehl, *Der philosophische Kritizismus und seine Bedeutung für die positive Wissenschaft* (1876, 1879, 1887), is in its first edition still under the influence of Cohen's view of the transcendental.

Riehl, too, emphasizes that the question of the objective stock and the objective validity of knowledge should not be confounded with the question of the formation of ideas within the subjective consciousness. Kant's decisive achievement, according to Riehl, consists just in this, that he distinguished clearly the two questions, the "transcendental" and the "psychological," that he separated the problem of the objective significance of knowledge from the genetic question of its derivation.

But this idealism of the general forms of pure intuition and pure understanding constitutes, according to Riehl, only one phase of the Kantian doctrine, which has its counterpart in another equally legitimate and equally indispensable one. For the particulars of experience, the definite spatial and temporal order of empirical phenomena, as well as the specific causal laws subsisting between them, are never to be deduced from those general forms. Here we find ourselves necessarily referred to that other factor which Kant called the "material" factor of knowledge. The concepts of understanding as well as the pure forms of space and time give only the universal and necessary form of experienced reality, while its content can never be given to us otherwise than through sensation, through immediate sense perception. Thus the latter forms the specific and indispensable basis of our conviction regarding the reality of things.

Riehl characterizes this view as "critical realism" and sees in it the specific kernel of Kant's teaching. "For the specific and definite forms of things as given in empirical intuition, that is, the position, shape, size, the definite and determinate duration and sequence of things, there must be, according to the explicit teaching of Kant, a source in the things themselves. For they cannot be derived from the universal form of intuition which originates solely in the mentality of the subject. . . . The things-in-themselves, with their proportions as expressed in the specific forms of intuition and the empirical laws of nature, are for Kant a presupposition just as essential as the a priori elements of

cognition. The necessary combination of both, their union in experience, is the upshot of his teaching. Our knowledge of things is a mediate cognition of the things themselves through the appearances of the things to our senses" (*Zur Einführung in die Philosophie der Gegenwart,* 4th ed., p. 109 f. [1913]).

The Positivistic View.—Among all the thinkers of the Neo-Kantian movement, Riehl is the one who is most strongly influenced by the positivistic view of the nature and the task of philosophy. Scientific philosophy, in the strict sense of the word, is for him almost synonymous with pure epistemology and the methodology of the special sciences.

Hence, there remains no special field of study reserved as its proper domain; rather it is merely the texture and the logical structure of knowledge, of science itself, with which philosophic reflection can be concerned. "Instead of things, it investigates the understanding which recognizes things; instead of nature, the science of nature; instead of phenomena, their presuppositions in the consciousness of man." However, through this confinement of philosophy to the pure science of knowledge, Riehl ends by allowing the theory of values to fall out of it entirely.

To be sure, Riehl admits that there must be a "teleology of human life" for which mere knowledge of nature is not sufficient; but he himself did not study systematically the problems of this teleology, especially the ethical and aesthetic problems and the philosophy of history; he touched upon them only occasionally. "Views of the world" (*Weltanschauungen*)—so he declares explicitly—are not a matter of mere understanding; and they are for that reason subjective in the main; they do not belong to science but to faith. This separation of knowledge from faith carried with it the danger that scientific value was attributed to natural knowledge exclusively, while the pure sciences of the mind (*Geisteswissenschaften*), the sciences of the historical reality of man's mental achievements, were deprived of their specific methodical foundation.

Windelband and Rickert.—Here lies the problem from which started that tendency of Neo-Kantianism which was founded by Wilhelm Windelband and carried on by Heinrich Rickert. The epochal works of Wilhelm Dilthey (1833–1912), especially his *Einleitung in die Geisteswissenschaften* (1883), had led the attention of 19th-century German philosophy back to the foundations of the historical world in the sciences of the mind. In trying to present, and to solve, this problem in the spirit of the strictly critical philosophy, it was first of all necessary to draw a sharp line between the form of science exemplified by history and that represented by natural science.

This is the task which Windelband sets himself in his address *Geschichte und Naturwissenschaft.* The pure "sciences of laws" are here contrasted with the "sciences of events," the "nomothetic" procedure of natural science with the "ideographic" procedure of history. Rickert elaborates this distinction in his work *Die Grenzen der naturwissenschaftlichen Begriffsbildung,* which he calls a logical introduction to the historical sciences (1896–1902; 2nd ed., 1913). In this justification, the isolated place which the pure science of knowledge had received with Riehl is abolished.

For Windelband and Rickert (*cf.* especially Rickert's *Der Gegenstand der Erkenntnis* [1892; 2nd ed., 1904]) the theory of knowledge, too, is included in the group of the sciences of values, because it is a science of "oughts," of the universally valid norms of truth. In this respect, it stands on the same level as the other studies of values, especially with ethics and aesthetics. Philosophy, as a general theory of values, as the science of the "consciousness of norms" (*Normalbewustsein*), is essentially a philosophy of culture. Its task may be said to consist in establishing a connection between the realm of "reality" and the realm of values. It is only the concept of value that makes history possible as a science, for only through the values attached to culture can we obtain a definite principle of selection within the infinite manifold of the historical facts, and thus establish the conception of a historical individuality which is capable of description. If we now survey the path of the Neo-Kantian movement from its first beginnings to its present stage, we may say by way of summary that it has gradually encircled the total orbit of knowledge by trying to advance more and more from the "abstract" to the "concrete," from the general principles of knowledge to the specific content of mental culture. (E. Cr.)

NEOLITHIC: *see* ARCHAEOLOGY.

NEON, a rare inert gas of the atmosphere (*q.v.*) represented by the symbol Ne. It is the second member of the helium family of elements, composed of helium, neon, argon, krypton, xenon and radon, which comprises Group zero of the periodic system.

Neon has an atomic number of 10 and an atomic weight of 20.183. Its stable isotopes, listed in order of decreasing abundance, have mass numbers of 20, 22 and 21. Radioactive isotopes of mass numbers 19 and 23 may be obtained by nuclear reactions. Electrons of the atom occupy and fill the K and L ($2s^2$, $2p^6$) shells.

The element was discovered in 1898 by Sir William Ramsay and M. W. Travers as a component of the most volatile fraction of liquefied crude argon obtained from air and was given a name meaning "the new one."

Neon is widely distributed in nature and occurs in traces not only in the atmosphere but also in gases trapped within the earth. The content in dry air is close to 0.0018% by volume. Industrial production of the element is accomplished by fractional distillation of air using equipment such as that shown in the figure. The most volatile fraction taken from such a still is composed of helium, neon and nitrogen. The latter gas is removed by chemical absorption and the neon is then separated from helium by selective adsorption on activated

EQUIPMENT FOR THE FRACTIONAL DISTILLATION OF LIQUID AIR TO ISOLATE NEON AND OTHER GASES OF THE ATMOSPHERE

charcoal at low temperature. The price of neon in the United States in the early 1950s was about $1.50 per litre when sold in cylinders of 50-l. capacity.

The following physical constants have been selected from technical literature, most of the values being taken from a table critically compiled by F. P. Gross: density of the gas at 1 atm. pressure and 0° C, 0.8999 g. per litre; density of the liquid at its boiling point, 1.204 g. per millilitre; normal boiling point, −246.09° C.; freezing point, −248.61° C.; critical temperature, −228.75° C.; critical pressure, 26.86 atm.; heat of vaporization at the normal boiling point, 20.8 cal. per gram; heat of fusion, per gram, 3.97 cal.; ionization potential for first electron, 21.5 v.; solubility in water (neon at 1 atm. pressure) at 25° C., 0.0101 ml. (measured at 1 atm. pressure and 0° C.) per millilitre of water; at 15° C., 0.0108 ml. of neon per millilitre of water. Since the ratio of the specific heat of the gas at constant pressure to that at constant volume is 1.642, it may be concluded that a single atom of the element comprises a molecule.

Neon is used in a variety of lamps and other electrical devices which take advantage of its unusually high electrical conductivity and light-emissive power. The brilliant orange-red light emitted from "neon tubes" in which an electrical discharge passes through the gas under a pressure of a few millimetres of mercury first became a familiar sight in the 1920s. Most gaseous conduction lamps and fluorescent lamps contain neon as a component of the gaseous mixture which carries the electricity. Other neon-tube devices include lightning arresters, high-voltage testers and negative glow lamps. The latter can be built with electrodes in the form of figures or letters suitable for display purposes or house numbers.

Neon forms no stable chemical compounds and appears to attract other atoms only by the relatively weak interatomic action known as van der Waals forces. Procedures for the analytical determination of neon provide for measuring the gas after it has been isolated by chemical absorption of reactive gases on hot calcium or other reagent and separation of helium, argon, krypton and xenon by physical means. Such a physical separation is usually accomplished by fractional desorption from cold activated charcoal or by diffusion (of helium) through hot quartz. The element is recognized by its characteristic spectrum which contains many beautiful red lines.

NEOPHYTE, a word used in the Eleusinian and other mysteries to designate the newly initiated, and in the early church applied to newly baptized persons. These usually wore the white garments which they received at their admission to the church (*see* BAPTISM) for eight days, from Easter eve till the Sunday after Easter (hence called *Dominica in albis*), but they were subject to strict supervision for some time longer.

NEOPLATONISM, the name given specially to the last school of pagan philosophy, which grew up mainly among the Greeks of Alexandria from the 3rd century onwards. The term has also been applied to the Italian humanists of the Renaissance, and in modern times, somewhat vaguely, to thinkers who have based their speculations on the Platonic metaphysics or on Plotinus, and incorporated with it a tendency towards a mystical explanation of ultimate phenomena.

Historical Position and Significance.—Just as the Later Roman empire was at once the supreme effort of the old world and the outcome of its exhaustion, so Neoplatonism is in one aspect the consummation, in another the collapse, of ancient philosophy. Never before in Greek or in Roman speculation had the consciousness of man's dignity and superiority to nature found such adequate expression; never before had real science and pure knowledge been so undervalued and despised by the leaders of culture as they were by the Neoplatonists.

It is a proof of the strength of the moral instincts of mankind that the only phase of culture which we can survey in all its stages from beginning to end culminated not in materialism, but in the boldest idealism. This idealism, however, is also in its way a mark of intellectual bankruptcy. Contempt for reason and science leads in the end to barbarism—its necessary consequence being the rudest superstition. As a matter of fact, barbarism did break out after the flower had fallen from Neoplatonism. The philosophers themselves, no doubt, still lived on the knowledge they repudiated; but the masses were trained to a superstition with which the Christian church, as the executor of Neoplatonism, had to reckon and contend. By a fortunate coincidence, at the very moment when this bankruptcy of the old culture must have become apparent, the stage of history was occupied by barbaric peoples. This has obscured the fact that the inner history of antiquity, ending as it did in despair of this world, must in any event have seen a recurrence of barbarism. The present world was a thing that men would neither enjoy nor master nor study. A new world was discovered, for the sake of which everything else was abandoned.

Such is Neoplatonism. The pre-Socratic philosophy took its stand on natural science, to the exclusion of ethics and religion. The systems of Plato and Aristotle sought to adjust the rival claims of physics and ethics (although the supremacy of the latter was already acknowledged); but the popular religions were thrown overboard. The post-Aristotelian philosophy in all its branches makes withdrawal from the objective world its starting-point. It might seem, indeed, that Stoicism indicates a falling off from Plato and Aristotle towards materialism, but the ethical dualism, which was the ruling tendency of the Stoa, could not long endure its materialistic physics, and took refuge in the metaphysical dualism of the Platonists. But this originated no permanent philosophical creation. From one-sided Platonism issued the various forms of scepticism, the attempt to undermine the trustworthiness of empirical knowledge. Neoplatonism, coming last, borrowed something from all the schools. First, it stands in the line of post-Aristotelian systems; it is, in fact, as a subjective philosophy, their logical completion. Secondly, it is founded on scepticism; for it has neither interest in, nor reliance upon, empirical knowledge. Thirdly, it can justly claim the honour of Plato's name, since it expressly goes back to him for its metaphysics, directly combating those of the Stoa. Yet even on this point it learned something from the Stoics; the Neoplatonic conception of the action of the Deity on the world and of the essence and origin of matter can only be explained by reference to the dynamic pantheism of the Stoa. Fourthly, the study of Aristotle also exercised an influence on Neoplatonism. This appears not only in its philosophical method, but also—though less prominently—in its metaphysic. And, fifthly, Neoplatonism adopted the ethics of Stoicism; although it was found necessary to supplement them by a still higher conception of the functions of the spirit. Philosophy as represented by Neoplatonism, its sole interest being a religious interest, and its highest object the supra-rational, must be a philosophy of revelation.

This is not a prominent feature in Plotinus or his immediate disciples, who still exhibit full confidence in the subjective presuppositions of their philosophy. But the later adherents of the school did not possess this confidence; they based their philosophy on revelations of the Deity, and they found these in the religious traditions and rites of all nations. The Stoics had taught them to overstep the political boundaries of states and nationalities, and rise from the Hellenic to a universal human consciousness. Through all history the spirit of God has breathed; everywhere we discover the traces of His revelation. The older any religious tradition or mode of worship is, the more venerable is it, the richer in divine ideas. Hence the religions of the East had a peculiar interest for the Neoplatonist. Neoplatonism seizes on the aspiration of the human soul after a higher life, and treats this psychological fact as the key to the interpretation of the universe. Hence the existing religions, after being refined and spiritualized, were made the basis of philosophy.

Neoplatonism thus represents a stage in the history of religion; indeed this is precisely where its historical importance lies. In the progress of science and enlightenment it has no positive significance, except as a necessary transition which the race had to make in order to get rid of nature-religion, and that under-valuing of the spiritual life which formed an insuperable obstacle to the advance of human knowledge. Neoplatonism, however, failed as signally in its religious enterprise as it did in its philosophical. While seeking to perfect ancient philosophy, it really extinguished it; and in like manner its attempted reconstruction of ancient religions only resulted in their destruction. For in requiring these religions to impart certain prescribed religious truths, and to inculcate the highest moral tone, it burdened them with problems to which they were unequal. And further, by inviting them to loosen, though not exactly to dissolve, their political allegiance—the very thing that gave them stability—it removed the foundation on which they rested.

There is one other question which we are called upon to raise here. Why did not Neoplatonism set up an independent religious community? Why did it not provide for its mixed multitude of divinities by founding a universal church, in which all the gods of all nations might be worshipped along with the one ineffable Deity? The answer to this question involves the answer to another—Why was Neoplatonism defeated by Christianity? Three things were wanting in Neoplatonism; they are admirably indicated in Augustine's *Confessions* (vii. 18–21). First, and chiefly, it lacked a religious founder; second, it could not tell how the state of inward peace and blessedness could become permanent; third, it had no means to win those who were not endowed with the speculative faculty. The philosophical discipline which it recommended for the attainment of the highest good was beyond the reach of the masses; and the way by which the masses could attain the highest good was a secret unknown to Neoplatonism.

Yet the influence of Neoplatonism on the history of our ethical culture is immeasurable, above all because it begot the consciousness that the only blessedness which can satisfy the heart must be sought higher even than the sphere of reason. That man shall not live by bread alone, the world had learned before Neoplato-

nism; but Neoplatonism enforced the deeper truth—a truth which the older philosophy had missed—that man shall not live by knowledge alone.

Origin.—As forerunners of Neoplatonism we may regard, on the one hand, those Stoics who accepted the Platonic distinction between the sensible world and the intelligible, and, on the other hand, the so-called Neopythagoreans and religious philosophers like Plutarch of Chaeronea and especially Numenius of Apamea. The Jewish and Christian thinkers of the first two centuries approach considerably nearer than Numenius to the later Neoplatonism. Here we have Philo, to begin with. Philo, who translated the Old Testament religion into the terms of Hellenic thought, holds as an inference from his theory of revelation that the divine Supreme Being is "supra-rational," that He can be reached only through "ecstasy," and that the oracles of God supply the material of moral and religious knowledge. The religious ethics of Philo—a compound of Stoic, Platonic and Neopythagorean elements—already bear the peculiar stamp which we recognize in Neoplatonism. While his system assigns the supremacy to Greek philosophy over the national religion of Israel, it exacts from the former, as a sort of tribute to the latter, the recognition of the elevation of God above the province of reason. The claim of positive religion to be something more than the intellectual apprehension of the reason in the universe is thus acknowledged. Religious syncretism is also a feature of Philo's system, but it differs essentially from what we find in later Neoplatonism. For Philo pays no respect to any cultus except the Jewish; and he believed that all the fragments of truth to be found amongst Greeks and Romans had been borrowed from the books of Moses. The earliest Christian philosophers, particularly Justin and Athenagoras, likewise prepared the way for the speculations of the Neoplatonists—partly by their attempts to connect Christianity with Stoicism and Platonism, partly by their ambition to exhibit Christianity as "hyperplatonic." In the introduction to his *Dialogue with Trypho*, Justin follows a method which bears a striking resemblance to the later method of Neoplatonism: he seeks to base the Christian knowledge of God—that is, the knowledge of the truth—on Platonism, Scepticism and "Revelation." A still more remarkable parallel to the later Neoplatonism is afforded by the Christian Gnostics of Alexandria, especially Valentinus and the followers of Basilides. Like the Neoplatonists, the Basilidians believed, not in an emanation from the Godhead, but in a dynamic manifestation of its activity. The same is true of Valentinus, who also placed an unnameable being at the apex of his system, and regarded matter, not as a second principle, but as a product of the one divine principle.

But were the oldest Neoplatonists really acquainted with the speculations of Philo, or Justin, or Valentinus, or Basilides? Did they know the Oriental religions, Judaism and Christianity in particular? And, if so, did they really derive anything from these sources?

To these questions we cannot give definite answers. Since Neoplatonism originated in Alexandria, where Oriental modes of worship were accessible to every one, and since the Jewish philosophy had also taken its place in the literary circles of Alexandria, we may safely assume that even the earliest of the Neoplatonists possessed an acquaintance with Judaism and Christianity. But if we search Plotinus for evidence of any actual influence of Jewish and Christian philosophy, we shall search in vain. We have to come down to Iamblichus and his school before we find complete correspondence with the Christian Gnosticism of the 2nd century; that is to say, it is only in the 4th century that Greek philosophy in its proper development reaches the stage at which certain Greek philosophers who had embraced Christianity had arrived in the 2nd century. The influence of Christianity—whether Gnostic or Catholic—on Neoplatonism was at no time very considerable, although individual Neoplatonists, after Amelius, used Christian texts as oracles, and put on record their admiration for Christ.

History and Doctrines.—The founder of the Neoplatonic school in Alexandria is supposed to have been Ammonius Saccas (*q.v.*). But the *Enneads* of his pupil Plotinus are the primary and classical document of Neoplatonism. The doctrine of Plotinus is mysticism, and like all mysticism it consists of two main divisions. The first or theoretical part deals with the high origin of the human soul, and shows how it has departed from its first estate. In the second or practical part the way is pointed out by which the soul may again return to the Eternal and Supreme. Since the soul in its longings reaches forth beyond all sensible things, beyond the world of ideas even, it follows that the highest being must be something supra-rational. The system thus embraces three heads—(1) the primeval Being, (2) the ideal world and the soul, (3) the phenomenal world.

The primeval Being is, as opposed to the many, the One; as opposed to the finite, the Infinite, the unlimited. It is the source of all life, and therefore absolute causality and the only real existence. It is, moreover, the Good, in so far as all finite things have their purpose in it, and ought to flow back to it. But one cannot attach moral attributes to the original Being itself, because these would imply limitation. It has no attributes of any kind; it is being without magnitude, without life, without thought; in strict propriety, indeed, we ought not to speak of it as existing; it is "above existence," "above goodness." It is also active force without a substratum; as active force the primeval Being is perpetually producing something else, without alteration, or motion, or diminution of itself. This production is not a physical process, but an emission of force; and, since the product has real existence only in virtue of the original existence working in it, Neoplatonism may be described as a species of dynamic pantheism. Directly or indirectly, everything is brought forth by the "One."

The original Being first of all throws out the *nous,* which is a perfect image of the One and the archetype of all existing things. It is at once being and thought, ideal world and idea. As image, the *nous* corresponds perfectly to the One, but as derived it is entirely different. What Plotinus understands by the *nous* is the highest sphere accessible to the human mind, and, along with that, pure thought itself.

The image and product of the motionless *nous* is the soul, which, according to Plotinus is, like the *nous,* immaterial. Its relation to the *nous* is the same as that of the *nous* to the One. It stands between the *nous* and the phenomenal world, is permeated and illuminated by the former, but is also in contact with the latter. The *nous* is indivisible; the soul *may* preserve its unity and remain in the *nous,* but at the same time it has the power of uniting with the corporeal world and thus being disintegrated. It therefore occupies an intermediate position. As a single soul (world-soul) it belongs in essence and destination to the intelligible world; but it also embraces innumerable individual souls; and these can either submit to be ruled by the *nous,* or turn aside to the sensual and lose themselves in the finite.

The human souls which have descended into corporeality are those which have allowed themselves to be ensnared by sensuality and overpowered by lust. They now seek to cut themselves loose from their true being; and, striving after independence, they assume a false existence. They must turn back from this; and, since they have not lost their freedom, a conversion is still possible.

Here, then, we enter upon the practical philosophy. Along the same road by which it descended the soul must retrace its steps back to the supreme Good. It must first of all return to itself. This is accomplished by the practice of virtue, which aims at likeness to God, and leads up to God. In the ethics of Plotinus all the older schemes of virtue are taken over and arranged in a graduated series. The lowest stage is that of the civil virtues, then follow the purifying, and last of all the divine virtues. The civil virtues merely adorn the life, without elevating the soul. That is the office of the purifying virtues, by which the soul is freed from sensuality and led back to itself, and thence to the *nous.* By means of ascetic observances the man becomes once more a spiritual and enduring being, free from all sin. But there is still a higher attainment; it is not enough to be sinless, one must become "God." This is reached through contemplation of the primeval Being, the One—in other words, through an ecstatic approach, the soul may see God, the fountain of life, the source of being, the origin of all good, the root of the soul. In that

moment it enjoys the highest indescribable bliss; it is as it were swallowed up of divinity, bathed in the light of eternity. Porphyry tells us that on four occasions during the six years of their intercourse Plotinus attained to this ecstatic union with God.

Such is the religious philosophy of Plotinus, and for himself personally it sufficed, without the aid of the popular religion or worship. Nevertheless he sought for points of support in these. God is certainly in the truest sense nothing but the primeval Being; but He reveals Himself in a variety of emanations and manifestations. The *nous* is a sort of second god, the λόγοι which are wrapped up in it are gods, the stars are gods.

Amongst his pupils, Amelius and Porphyry are the most eminent. Amelius modified the teaching of Plotinus on certain points; and he also put some value on the prologue to the Gospel of John. To Porphyry (*q.v.*) belongs the credit of having recast and popularized the system of his master Plotinus. He was not an original thinker, but a diligent student, distinguished by great learning, by a turn for historical and philological criticism, and by an earnest purpose to uproot false teaching, especially Christianity, to ennoble men and train them to goodness. The system of Porphyry is more emphatically practical and religious than that of Plotinus. The object of philosophy, according to Porphyry, is the salvation of the soul. The origin and the blame of evil are not in the body, but in the desires of the soul. Hence the strictest asceticism (abstinence from flesh, and wine, and sexual intercourse) is demanded, as well as the knowledge of God. As he advanced in life, Porphyry protested more and more earnestly against the rude faith of the common people and their immoral worships. His work *Against the Christians* was directed, not against Christ, nor against what he believed to be Christ's teaching, but against the Christians of his own day and their sacred books, which, according to Porphyry, were the work of deceivers and ignorant people. In his trenchant criticism of the origin of what passed for Christianity in his time, he spoke bitter and severe truths, which have gained for him the reputation of the most rabid and wicked of all the enemies of Christianity. His work was destroyed, it was condemned by an edict of the emperors Theodosius II. and Valentinian in the year 448, and the copious extracts which we find in Lactantius, Augustine, Jerome, Macarius Magnus and others show how profoundly he had studied the Christian writings, and how great was his talent for real historical research.

Porphyry marks the transition to a new phase of Neoplatonism, in which it becomes completely subservient to polytheism, and seeks before everything else to protect the Greek and Oriental religions from the formidable assault of Christianity. In the hands of Iamblichus (*q.v.*), the pupil of Porphyry, Neoplatonism is changed "from a philosophical theory to a theological doctrine."

The numerous followers of Iamblichus—Aedesius, Chrysanthius, Eusebius, Priscus, Sopater, Sallust, and, most famous of all, Maximus (*q.v.*), rendered little service to speculation. Some of them (Themistius in particular) are known as commentators on the older philosophers, and others as the missionaries of mysticism. The work *De mysteriis Aegyptiorum* is the best sample of the views and aims of these philosophers. Their hopes rose high when Julian ascended the imperial throne (361–363). But the emperor himself lived long enough to see that his romantic policy of restoration was to leave no results; and after his early death all hope of extinguishing Christianity was abandoned.

But undoubtedly the victory of Christianity in the age of Valentinian and Theodosius had a purifying influence on Neoplatonism. During the struggle for supremacy, the philosophers had been driven to make common cause with everything that was hostile to Christianity. But now Neoplatonism was thrust from the great stage of history. The church and church theology, to whose guidance the masses now surrendered themselves, took in along with them their superstition, their polytheism, their magic, their myths, and all the machinery of religious witchcraft. The more all this settled and established itself—certainly not without opposition—in the church the purer did Neoplatonism become. While maintaining intact its religious attitude and its theory of knowledge, it returned with new zest to scientific studies, especially the study of the old philosophers. If Plato still remains the divine philosopher, yet we can perceive that after the year 400 the writings of Aristotle are increasingly read and valued. In the chief cities of the empire Neoplatonic schools flourished till the beginning of the 5th century; during this period, indeed, they were the training-schools of Christian theologians. At Alexandria the noble Hypatia (*q.v.*) taught, to whose memory her impassioned disciple Synesius, afterwards a bishop, reared a splendid monument. But after the beginning of the 5th century the fanaticism of the church could no longer endure the presence of "heathenism." The murder of Hypatia was the death of philosophy in Alexandria, although the school there maintained a lingering existence till the middle of the 6th century. But there was one city of the East which, lying apart from the crowded highways of the world, had sunk to a mere provincial town, and yet possessed associations which the church of the 5th century felt herself powerless to eradicate. In Athens a Neoplatonic school still flourished.

The most distinguished teachers at Athens were Plutarch (*q.v.*), his disciple Syrianus (who did important work as a commentator on Plato and Aristotle, and further deserves mention for his vigorous defence of the freedom of the will), but above all Proclus (411–485). Proclus is the great schoolman of Neoplatonism. Forty-four years after the death of Proclus the school of Athens was closed by Justinian (A.D. 529); but it had already fulfilled its mission in the work of Proclus. The works of Proclus, as the last testament of Hellenism to the church and the middle ages, exerted an incalculable influence on the next thousand years. They not only formed one of the bridges by which the mediaeval thinkers got back to Plato and Aristotle; they determined the scientific method of thirty generations, and they partly created and partly nourished the Christian mysticism of the middle ages.

The disciples of Proclus are not eminent (Marinus, Asclepiodotus, Ammonius, Zenodotus, Isidorus, Hegias, Damascius). The last president of the Athenian school was Damascius (*q.v.*). When Justinian issued the edict for the suppression of the school, Damascius along with Simplicius (the painstaking commentator on Aristotle) and five other Neoplatonists set out to make a home in Persia. They found the conditions were unfavourable and were allowed to return (*see* CHOSROES I.).

At the beginning of the 6th century Neoplatonism had ceased to exist in the East as an independent philosophy. Almost at the same time, however—and the coincidence is not accidental—it made new conquests in the church theology through the writings of the pseudo-Dionysius. It began to bear fruit in Christian mysticism, and to diffuse a new magical leaven through the worship of the church. In the West, where philosophical efforts of any kind had been very rare since the 2nd century, and where mystical contemplation did not meet with the necessary conditions, Neoplatonism found a congenial soil only in isolated individuals. G. Marius Victorinus (*q.v.*) translated certain works of Plotinus, and thus had a decisive influence on the spiritual history of Augustine (*Confess.*, vii, 9; viii, 2). It may be said that Neoplatonism influenced the West only through the medium of the church theology, or, in some instances, under that disguise. Even Boethius (it may now be considered certain) was a catholic Christian, although his whole mode of thought was certainly Neoplatonic (*see* BOETHIUS, ANICIUS MANLIUS SEVERINUS).

Neoplatonism and the Theology of the Church.—The question as to the influence of Neoplatonism on the development of Christianity is not easily answered, because it is scarcely possible to get a complete view of their mutual relations. The answer will depend, in the first instance, upon how much is included under the term "Neoplatonism." If Neoplatonism is understood in the widest sense, as the highest and fittest expression of the religious movements at work in the Graeco-Roman empire from the 2nd to the 5th century, then it may be regarded as the twin-sister of the church dogmatic which grew up during the same period; the younger sister was brought up by the elder, then rebelled against her and at last tyrannized over her. In so far as Neoplatonism and the church dogmatic set out from the felt need of redemption, in so far as both sought to deliver the soul from sensuality and recognized man's inability without divine

aid—without a revelation—to attain salvation and a sure knowledge of the truth, they are at once most intimately related and at the same time mutually independent. It must be confessed that when Christianity began to project a theology it was already deeply impregnated by Hellenic influences. But the influence is to be traced not so much to philosophy as to the general culture of the time, and the whole set of conditions under which spiritual life was manifested. When Neoplatonism appeared, the Christian church had already laid down the main positions of her theology; or if not, she worked them out alongside of Neoplatonism—*that* is not a mere accident—but still independently. It was only by identifying itself with the whole history of Greek philosophy, or by figuring as pure Platonism restored, that Neoplatonism could stigmatize the church theology of Alexandria as a plagiarism from itself. These assumptions, however, were fanciful. Although our sources are unfortunately very imperfect, the theology of the church does not appear to have learned much from Neoplatonism in the 3rd century—partly because the latter had not yet reached the form in which its doctrines could be accepted by the church dogmatic, and partly because theology was otherwise occupied. Her first business was to plant herself firmly on her own territory, to make good her position and clear away old and objectionable opinions. Origen was quite as independent a thinker as Plotinus; only, they both drew on the same tradition. From the 4th century downwards, however, the influence of Neoplatonism on the Oriental theologians was of the utmost importance. The church gradually expressed her most peculiar convictions in dogmas, which were formulated by philosophical methods, but were irreconcilable with Neoplatonism (the Christological dogmas); and the further this process went the more unrestrainedly did theologians resign themselves to the influence of Neoplatonism on all other questions. The doctrines of the incarnation, the resurrection of the flesh and the creation of the world in time marked the boundary line between the church's dogmatic and Neoplatonism; in every other respect, theologians and Neoplatonists drew so closely together that many of them are completely at one. In fact, there were special cases, like that of Synesius, in which a speculative reconstruction of distinctively Christian doctrines by Christian men was winked at. If a book does not happen to touch on any of the above-mentioned doctrines, it may often be doubtful whether the writer is a Christian or a Neoplatonist. In ethical precepts, in directions for right living (that is, asceticism), the two systems approximate more and more closely. But it was here that Neoplatonism finally celebrated its greatest triumph. It indoctrinated the church with all its mysticism, its mystic exercises and even its magical cultus as taught by Iamblichus. The works of the pseudo-Dionysius contain a gnosis in which, by means of the teaching of Iamblichus and Proclus, the church's theology is turned into a scholastic mysticism with directions on matters of practice and ritual. And as these writings were attributed to Dionysius, the disciple of the apostles, the scholastic mysticism which they unfold was regarded as an apostolic, not to say a divine, science. The influence exercised by these writings, first on the East, and then—after the 9th (or 12th) century—on the West, cannot be overestimated. It is impossible to enlarge upon it here; suffice it to say that the mystical and pietistic devotion of our own day, even in the Protestant churches, is nourished on works whose ancestry can be traced, through a series of intermediate links, to the writings of the pseudo-Areopagite.

In the ancient world there was only one Western theologian who came directly under the influence of Neoplatonism; but that one is Augustine, the most important of them all. It was through Neoplatonism that Augustine got rid of scepticism and the last dregs of Manichaeism. In the seventh book of his *Confessions* he has recorded how much he owed to the perusal of Neoplatonic works. On all the cardinal doctrines—God, matter, the relation of God to the world, freedom and evil—Augustine retained the impress of Neoplatonism; at the same time he is the theologian of antiquity who most clearly perceived and most fully stated wherein Neoplatonism and Christianity differ. The best ever written by any church father on this subject is to be found in chaps. ix.-xxi. of the seventh book of the *Confessions*.

Why Neoplatonism succumbed in the conflict with Christianity is a question which the historians have never satisfactorily answered. As a rule, the problem is not even stated correctly. We have nothing to do here with our own private ideal of Christianity, but solely with catholic Christianity and catholic theology. These are the forces that conquered Neoplatonism, after assimilating nearly everything that it contained. Further, we must consider the arena in which the victory was won. The battlefield was the empire of Constantine and Theodosius. It is only when these and all other circumstances of the case are duly realized that we have a right to inquire how much the essential doctrines of Christianity contributed to the victory, and what share must be assigned to the organization of the church.

In mediaeval theology and philosophy mysticism appears as the powerful opponent of rationalistic dogmatism. The empirical science of the Renaissance and the two following centuries was itself a new development of Platonism and Neoplatonism, as opposed to rationalistic dogmatism, with its contempt for experience. Magic, astrology and alchemy—all the outgrowth of Neoplatonism—gave the first effectual stimulus to the observation of nature, and consequently to natural science, and in this way finally extinguished barren rationalism. Thus in the history of science Neoplatonism has played a part and rendered services of which Plotinus or Iamblichus or Proclus never dreamt. So true is it that sober history is often stranger and more capricious than all the marvels of legend and romance.

NEOPTOLEMUS (also called PYRRHUS), in Greek legend, the son of Achilles (*q.v.*) and Deïdameia. He was brought up by his grandfather Lycomedes in the island of Scyros, and taken to Troy in the last year of the war by Odysseus, since Helenus had declared that the city could not be captured without the aid of a descendant of Aeacus. He distinguished himself by his valour and took part in the capture, slaying Priam. He was the ancestor of the Molossian kings, who therefore claimed to be of pure Hellenic stock. He was murdered by Orestes at Delphi, where he was buried, and a festival held in his honour every 8th year.

NEOPYTHAGOREANISM, a Graeco-Alexandrian school of philosophy, which became prominent in the 1st century A.D. Very little is known about the members of this school, and there has been much discussion as to whether the Pythagorean literature which was widely published at the time in Alexandria was the original work of 1st-century writers or merely reproductions of and commentaries on the older Pythagorean writings. The only well-known members of the school were Apollonius of Tyana and Moderatus of Gades. In the previous century Cicero's learned friend P. Nigidius Figulus (d. 45 B.C.) had made an attempt to revive Pythagorean doctrines, but he cannot be described as a member of the school. Further, it is necessary to distinguish from the Neopythagoreans a number of Eclectic Platonists, who, during the 1st century of our era, maintained views which had a similar tendency (*e.g.* Apuleius of Madaura, Plutarch of Chaeronea and, later, Numenius of Apamea).

Neopythagoreanism was the first product of an age in which abstract philosophy had begun to pall. The Stoics discovered that their "perfect man" was not to be found in the luxurious, often morbid society of the Graeco-Roman world; that something more than dialectic ethics was needed to reawaken a sense of responsibility. A degenerate society cared nothing for syllogisms grown threadbare by repetition. Neopythagoreanism was an attempt to introduce a religious element into pagan philosophy in place of what had come to be regarded as an arid formalism. The founders of the school sought to invest their doctrines with the halo of tradition by ascribing them to Pythagoras and Plato, and there is no reason to accuse them of insincerity. They went back to the later period of Plato's thought, the period when Plato endeavoured to combine his doctrine of Ideas with the Pythag-

orean number theory, and identified the *good* with the *one*, the source of the duality of the infinite and the measured (τὸ ἄπειρον and πέρας) with the resultant scale of realities from the *one* down to the objects of the material world. They emphasized the fundamental distinction between the soul and the body. God must be worshipped spiritually by prayer and the will to be good, not in outward action. The soul must be freed from its material surrounding, the "muddy vesture of decay," by an ascetic habit of life. Bodily pleasures and all sensuous impulses must be abandoned as detrimental to the spiritual purity of the soul. God is the principle of good, matter the groundwork of evil. In this system we distinguish not only the asceticism of Pythagoras and the later mysticism of Plato, but also the influence of the Orphic mysteries and of oriental philosophy. The Ideas of Plato are no longer self-subsistent entities; they are the elements which constitute the content of spiritual activity. The soul is no longer an appanage of οὐσία, it is οὐσία itself; the nonmaterial universe is regarded as the sphere of mind or spirit.

Thus Neopythagoreanism is a link in the chain between the old and the new in pagan philosophy. It connects the teaching of Plato with the doctrines of Neoplatonism and brings it into line with the later Stoicism and with the ascetic system of the Essenes. A comparison between the Essenes and the Neopythagoreans shows a parallel so striking as to warrant the theory that the Essenes were profoundly influenced by Neopythagoreanism. Lastly, Neopythagoreanism furnished Neoplatonism with the weapons with which pagan philosophy made its last stand against Christianity.

See APOLLONIUS OF TYANA; ESSENES; NEOPLATONISM; PYTHAGORAS; and Eduard Zeller's *Philosophie der Griechen.*

NEPAL, an independent state, situated on the northeastern frontier of India, lying between 80° 15′ and 88° 10′ E. long. and between 26° 20′ and 30° 10′ N. lat.; area, 54,000 sq.mi. Its extreme length is about 525 mi., and its breadth varies from 90 to 140 mi.

It is bounded on the north by Tibet; on the east by Sikkim; on the south by Bengal and the United Provinces; on the west by Kumaon, from which it is separated by the Kali river. Its population in 1950 was estimated at about 7,000,000.

Physical Features.—Nepal consists physically of two distinct territories: (1) the *tarai,* or strip of level, cultivated and forest land lying along the southern border; and (2) the great mountainous tract stretching northward to Tibet. Along the northern frontier stand many of the highest peaks of the Himalayan range, such as Mount Everest (29,141 ft.), Makalu (27,790 ft.), Kanchenjunga (28,140 ft.), Dhaulagiri (26,800 ft.), Gauri Sankar (23,440 ft.) and peaks varying from 20,000 to 24,000 ft. In clear weather this magnificent snowy range may be seen in an almost continuous line from the top of some of the lower ranges near Kathmandu. South of these are numerous parallel lower ranges, varying from 6,000 to 16,000 ft. in height, which are broken up by cross ranges.

These mountain ranges determine the course of the rivers, which are divided by the cross ranges into four groups. The first of these extends from Kumaon eastward as far as Dhaulagiri and consists of the affluents of the Kali (Sarda), Sarju, Kurnali, Eastern Sarju and Rapti, all of which ultimately form the Gogra or Gogari and flow into the Ganges. The second group, known to the Nepalese as the Sapt Gandaki, rises from the peaks between Dhaulagiri and Gosain Than and unites at Tribeni Ghat to form the Gandak. The third is a group of smaller rivers draining the great valley of Nepal, the valleys of Chitlong, Banepa and Panouti and portions of the *tarai* around the Churiaghati range of hills. These are the various branches of the Bara Gandak, the lesser Rapti, the Baghmati and Kumla. East of this again is the fourth group, known to the Nepalese as the Sapt Kosi, rising from the peaks between Gosain Than and Kanchenjunga and uniting to form the Sun Kosi, which falls into the Ganges. There is thus a natural division of the country into four portions. The westernmost is the country of the Baisi (22) rajas and contains the towns of Jumla, Doti and Sulliana. The second is the country of the Chaubisi (24) rajas and contains the towns of Malebum, Palpa, Gurkha and Nawakot. The third is the district containing Nepal proper, with the capital and many large towns. The fourth is the eastern portion of Nepal, comprising the country of the Kiratis and many small towns, such as Dhankota, Ilam and Bijapur.

The only portion of Nepal (with the exception of some portions of the *tarai* country which lies at the foot of the hills) ever visited by Europeans is the valley of Kathmandu, and even this can be entered only by special permission of the Nepal government. A narrow-gauge railway was opened by the Nepal government in Feb. 1927 and runs to Amlekhganj, 25 mi. from the Indian border at Raxaul, a small junction on the Oudh-Tirhut railway in the Champaran district in northern Bihar, due south of Kathmandu; a second railway, opened in 1940, runs a distance of 35 mi. from Jayanagor, on the Oudh-Tirhut railway, to Bijulpura. The road from Raxaul to Kathmandu is 75 mi., the first 50 mi. of which lie across the alluvial plain of the *tarai* through a sal forest to the foot of the hills, whence the road follows the beds of rivers and across low ridges till the small hamlet of Bhimphedi is reached. Up to this point the road is practicable for wheeled traffic. Motorcars run over it throughout the year except when abnormal rains cause breaches of the road. From Bhimphedi there is only a mountain track, which crosses two ridges (elevation about 8,000 ft.) and reaches the valley of Kathmandu about 9 mi. from the city, whence a fair carriage road is available. A ropeway was constructed from near Bhimphedi to the Kathmandu valley; it is operated by electricity from the power station in the valley, which also supplies electric light to the city.

In and around the Nepal valley the year may be divided into the rainy, cold and hot seasons. The rains begin in June and last till October, the average fall being about 60 in. annually. The cold season extends from the middle of October to the middle of April. From April to the beginning of the rains is the hot season, but the thermometer seldom exceeds 90° in the shade. The mean temperature is 60°. Violent thunderstorms are common, and occasionally severe earthquakes occur.

Flora and Fauna.—The flora and fauna are varied. Nepal may again be divided into three zones: (1) the *tarai* and lower ranges of hills up to 4,000 ft. in height; (2) the central ranges and high-lying valleys, up to 10,000 ft.; and (3) the alpine region, from 10,000 to 29,000 ft. in height.

The low alluvial land of the *tarai* is the granary of Nepal, but the greater portion consists of swamps, jungles and forests. Considerable stretches of land are, however, being reclaimed from year to year. The crops grown there are those of India—cotton, rice, wheat, pulse, sugar cane, tobacco, opium, indigo and some fruits and vegetables. The forests yield a magnificent supply of sal, sisu and other valuable forest trees and acacias, mimosas, cotton trees (*Bombax*), dak (*Butea frondosa*), large bamboos, rattans, palms and numerous ferns and orchids. On the Churiaghati range the common *Pinus longifolia* grows freely. Tea can be grown at heights between 2,000 and 4,000 ft. The middle zone supplies rice, wheat, maize, barley, oats, ginger, turmeric, chillies, potatoes, Cucurbitaceae, pineapples and many varieties of European fruits, vegetables and flowers. The forests contain tree rhododendron, *Pinus longifolia,* oak, horse chestnut, walnut, maple, hill bamboo, wild cherry, pear, allies of the tea plant, paper plant (*Daphne*), rose and many other inhabitants of temperate climes, and orchids, ferns and wild flowers. In the alpine zone exist Coniferae of many kinds, juniper, yew, box, holly, birch, dwarf rhododendron and other alpine flora.

The fauna follow a similar distribution. In the lowest zone are found the tiger, leopard, wolf, hyena and jackal, the elephant and rhinoceros, the gaur (*Gavaeus gaurus*), gayal (*Gavaeus frontalis*), wild buffalo or arna and many species of deer and the black bear (*Ursus labiatus*), peafowl, francolins, wild jungle fowl, the smaller vultures, etc. In the middle zone are found the leopard, the Himalayan black bear (*Ursus tibetanus*), the wild dog, cats of many sorts, squirrels, hares, porcupines, the pangolin and some species of deer and antelope, the larger vultures and eagles, pheasants (*Gallophasis*), *chikor,* hill partridges, etc. In the alpine zone are found the true bear (*Ursus isabellinus,* or brown bear), the yak, musk deer, wild goats and sheep, marmots, the eagle-vulture

(*Gypaetus*), the blood pheasant (*Ithaginis cruentus*), snow pheasant (*Tetraogallus himalayensis*), snow partridge (*Lerwa nivicola*), the horned pheasant (*Ceriornis saiyra*), crested pheasant (*Catrens wallichi*), etc. Geese, ducks, waders of all sorts and other migratory birds abound in the two lower zones.

HISTORY

Nepal and the somewhat similar country of Kashmir are peculiar among the Hindu states of the Indian subcontinent in possessing a historical literature. The Nepalese *Vamsavali* professes to start from a very early period in the Satya Yuga, when the present valley was still a lake. The earlier portion of it is devoted to the Satya and Treta Yugas and contains mythological tales and traditions having reference to various sacred localities in the country. During these two Yugas and also the Dwapara Yuga, the *Vamsavali* deals in round numbers of thousands of years.

In the beginning of the Kali Yuga, the Gupta dynasty is said to have been founded by Ne-Muni, from whom the country takes its name of Nepal. Lists are then given of the various dynasties, with the lengths of the reigns of the rajas. The dynasties mentioned are the Gupta, Ahir, Kirati, Somavanshi, Suryavanshi, Thakuri or first Rajput, Vaishya Thakuri, second Rajput and Karnataki dynasties. The country was then invaded by Mukundasena, and after his expulsion various Vaishya Thakuri dynasties are said to have held the throne for a period of 225 years. The chronology of the *Vamsavali* up to this period is confused and inaccurate; but the records begin to be clearer from the time of the invasion and conquest of the country by Harisinha-deva, raja of Simraun, in 1324. He was driven from Simraun by Tughlak Shah of Delhi, but seems to have found little difficulty in the conquest of Nepal. There were only four rajas of this Ayodhya dynasty, and then the throne was occupied by Jayabhadra-Malla, a descendant of Abhaya-Malla, one of the Rajput dynasty, who reigned in the 13th century. The seventh raja of this dynasty, Jayastithi-Malla, who reigned for 43 years (1386–1429), instituted legal codes and introduced the caste system to the Newars. In the reign of the eighth raja, Yaksha-Malla, the kingdom was divided into four separate states: Banepa, Bhatgaon or Bhaktapur, Kantipur or Kathmandu and Lalitapur or Patan. The Malla dynasty in the other three branches continued in power up to the conquest of the country by the Gurkhas in 1768. (*See* GURKHA.)

The Gurkhas were driven from their own country by the victorious Moslems and took refuge in the hilly districts about Kumaon, whence they gradually pushed their way eastward to Lamjung, Gurkha, Nayakot and ultimately the valley of Nepal, which under Raja Prithwi Narayana they finally captured. In the struggle which took place at Bhatgaon, Jayaprakasa (the raja of Kathmandu) was killed. Ranjit-Malla, the aged raja of Bhatgaon, retired to Benares, where he died. Tej Narsinha, the raja of Patan, died in confinement. During the latter years of the war Jayaprakasa applied to the British for assistance, and a small force, under Captain Kinloch, was sent into the *tarai* in 1765, but it was repulsed by the Gurkhas.

Prithwi Narayana died in 1774. He left two sons, Pratapasinha Sah and Bahadur Sah. The former succeeded his father but died in 1777, leaving an infant son, Rana Bahadur Sah, and his brother, who had been in exile, returned to Nepal as regent. The mother of the infant king, however, was opposed to him, and he had to flee again to British territory, where he remained till the death of the rani, when he again became regent. In 1790 the Gurkhas invaded Tibet and were at first successful; but they were brought into contact with the Chinese, who in 1791 sent a large force to invade Nepal. In 1792 the Chinese advanced as far as Nayakot and there dictated terms to the Nepalese. In 1791 the Gurkhas had entered into a commercial treaty with the British; William Kirkpatrick was therefore dispatched to Nepal and reached Nayakot in the spring of 1792, after the conclusion of peace. This embassy resulted in the ratification of another commercial treaty on March 1, 1792.

Rana Bahadur removed his uncle, Bahadur Sah, from the regency in 1795 and put him to death two years later. From this time to 1799 the king, who seems to have been insane, perpetrated the most barbarous outrages and his conduct became so intolerable that he was forced to abdicate in favour of his infant son, Girvan-yuddha Vikram Sah. Rana Bahadur recovered the throne in 1804 but was assassinated in 1805.

In Oct. 1801 another treaty was signed by the British and Nepalese authorities. A British resident was then sent to the Nepalese court, but was withdrawn in 1803, from which time the Nepalese carried on a system of encroachment and outrage on the frontier, which led to a declaration of war by the British in Nov. 1814. The fortunes of war were not constant on either side, and fighting was almost continuous. By the treaty of Sagauli (1815), which was finally ratified in March 1816, the Nepalese relinquished much of their newly acquired territory and agreed to allow a British residency to be established at Kathmandu. In November the raja died and was succeeded by his infant son, Surendra Vikram Sah, Gen. Bhimsena Thapa acting as regent.

In 1839 Bhimsena's enemies succeeded in driving him from power, and he committed suicide, or was murdered, in prison. The Kala Pandry faction then came into power, and there were frequent grave disputes with the British. In 1843 Matabar Singh, the nephew of Bhimsena, returned from exile, gained favour at court and speedily effected the destruction of his old enemies, the Kala Pandrys, who were seized and executed in May. At this time a nephew of Matabar Singh, Jung Bahadur, the eldest of a band of seven brothers, rose rapidly in the army and in favour at the court, especially with one of the ranis. He killed his uncle on May 18, 1845, obtained, with the aid of the rani, a prominent position in the government and soon after destroyed his enemies by what is known as the Kot massacre, on Sept. 15, 1846. From that time till the day of his death Jung Bahadur was in reality the ruler of Nepal. His old friend, the rani, was banished, and all posts of any consequence in the state were filled by Jung and his relations. In 1850 Jung Bahadur paid a visit to England and there proved himself to be a staunch friend of the British. On his return in 1851 he devoted himself to reforming the administration of the country, and it must be allowed that he eventually proved himself the greatest benefactor his country ever possessed. A treaty for the extradition of criminals was proposed in 1853 and ratified in Feb. 1855. In 1854 the Nepalese commenced a war against Tibet, which ended with a peace favourable to Nepal in March 1856.

In June 1857 intelligence of the mutiny of the native troops in Hindustan reached Nepal. Jung Bahadur, in spite of great opposition, stood firm as a friend of the British. On June 26, 4,000 troops were dispatched and rendered excellent service. Jung followed on Dec. 10 with a force of 8,000 men, 500 artillerymen and 24 guns, but too late to be of much use. Many of the mutineers and rebels, including Nana Sahib, took refuge in the Nepalese *tarai*, and it was not till the end of 1859 that they were finally swept out of the country. Jung Bahadur was knighted and decorated for his services and his troops received pay and handsome donations if wounded. Quantities of arms were presented to the Nepalese government and some territory was restored. This ground contains valuable sal and sisu forests and yields yearly a revenue of several lakhs of rupees.

After termination of the mutiny Nepalese history was uneventful. In spite of friendly relations with the British, many of the early restrictions against entering the country and trading there continued to be rigidly enforced. Sir Jung Bahadur died suddenly in 1877. His brother, Sir Ranadip Singh Bahadur, G.C.S.I., succeeded him as prime minister. Shortly after his accession to power a plot was formed against him, but nearly 40 of the conspirators were seized and executed, while others escaped into exile. He was, however, murdered in 1885 and was succeeded by his nephew Sir Shumsher Jung, G.C.S.I., who died in 1901 and was succeeded by his brother Deb Shumsher Jung. In June of that year a palace revolution placed another brother, Chandra Shumsher Jung, in power, while Deb Shumsher fled to India. Chandra Shumsher ruled Nepal with much ability. He gave effective aid to the British during the Tibet war of 1904, and the relations with the government of India became more cordial after his accession. In 1906 Chandra Shumsher was created a G.C.S.I.,

and in 1908 he visited England as a guest of the government, when he was invested with the G.C.B. and created major general in the British army and honorary colonel of the 4th Gurkha rifles.

During World War I, Sir Chandra Shumsher Jung placed the entire resources of his country at the disposal of the Allies. From 1915 to 1918 about 10,000 men of the Nepalese army served in India and on the Indian frontier. The 20 Gurkha battalions of the Indian army were increased to 40. In the brief Afghan War (1919), 2,000 Nepalese troops assisted the Indian government. Chandra Shumsher Jung was also responsible for the abolition of slavery in Nepal.

Replacing the old treaty of Sagauli, a new treaty of friendship was signed on Dec. 21, 1923, an important provision of which was the recognition by the British government of the complete independence of Nepal.

In World War II as in World War I the government ot Nepal supported the Allied war effort with men and money. Afterward, with a new situation having arisen in consequence of the partition of British India, the Republic of India and Nepal signed two treaties regulating their political and commercial relations (Aug. 1, 1950). In Nov. 1950, however, the agitation of the Nepal Congress party for a more democratic form of government led to disturbances and to the flight to India of the Maharajadhiraja Tribhuvana Bir Bikram Jung Bahadur (who had come to the throne in 1911). On representations by the Indian government Tribhuvana was restored, and a far-reaching program of constitutional reforms was announced at Kathmandu on Feb. 18, 1951. Ten months later the Congress party's spokesmen in the cabinet resigned because their efforts to implement this program were being thwarted by their reactionary colleagues.

SOCIAL AND ECONOMIC CONDITIONS

Population.—The races occupying Nepal are of mixed Mongol origin. To the north, in the higher mountains and valleys, dwell the Bhotias or Tibetans, to the west the Gurungs and Magars. The Murmis, Gorkhalis and Newars occupy the central parts, the Kirantis, Limbus and Lepchas the eastern. There are also Brahmans and Chhatris in the hills. There are other lesser tribes in the *tarai* and other malarious districts, known as Kumhas, Tharus, Manjis, etc., but generally classed together by the Nepalese as Aoulias, or dwellers in the districts where the *aoul,* a special type of malaria, prevails. The Gorkhalis or Gurkhas are descendants of the Brahmans and Rajputs who were driven from India by the Moslems and took refuge in the western hilly lands, where they ultimately became dominant and intermarried with the other races.

The Bhotias, Newars, Limbus, Kirantis and Lepchas are all Buddhists, but their religion became so mixed with Hinduism as to be hardly recognizable. The Newars entirely abandoned the monastic institutions of Buddhism and in great measure adopted the rules of caste, though these sit but lightly upon them. They burn their dead, eat the flesh of buffaloes, goats, sheep, ducks and fowls and drink beer and spirits. The Gorkhalis, Magars and Gurungs are Hindus, but the last two are by no means strict in the observance of their religion. Where temples are so numerous (there are 2,733 shrines in the valley), priests both Hindu and Buddhist abound. The festivals, too, are many, and holidays incessant. The *raj guru,* or high priest, is an influential person in the state and a member of council and has a large income from government lands as well as from fines for offenses against caste.

The various races have separate languages, or at least dialects. The Gorkhalis and western tribes use Parbatia (*see* PAHARI LANGUAGE), which, unlike the other dialects, is of Sanskrit origin. The Newars have a distinct language and alphabets, of which three are known to their pandits, though only one is in use; their language, called Gubhajius, resembles Tibetan but is interspersed with many Sanskrit words. The Bhotias use the Tibetan language and alphabet.

There are three large towns in the Nepal valley: Kathmandu (the capital, said to contain approximately 108,800 inhabitants in 1941), Patan (104,928) and Bhatgaon (93,176). The houses are from two to four stories in height, built of brick and tiled. The windows and balconies are of wood, and many are elaborately carved. There are numerous handsome temples in all the towns, the majority of which are pagoda-shaped and built of brick, with roofs of tiles or copper, which is sometimes gilt. The streets are narrow, many of them paved with brick or stone.

Agriculture.—Military service being the main occupation of the Gorkhalis, the agriculture of the valley is carried on chiefly by the Newars. The soil varies from light micaceous sand to dense ferruginous clay. The whole valley is cultivated and irrigated where practicable, and the slopes of the hills are terraced, so that there is little grazing ground, and few sheep or cattle are kept. There are some milch cows and buffaloes, which are stall-fed or grazed in the jungles at the foot of the hills. Animals for food and sacrifice are all imported and are consumed as fast as they are brought in. In the cold season the Bhotias bring large flocks of sheep and goats laden with bags of borax, salt and saltpetre. The animals are sold for food except for a few that are retained to carry back the bags. Poultry is kept and used by the Newars, especially ducks, the eggs of which are in great demand even among the orthodox Hindus. The crops grown in the valley consist of rice, wheat, pulse, murwah, maize, buckwheat, chillies, radishes, mustard, garlic, onions. ginger, turmeric, sugar cane, potatoes, peanuts, cucumbers and pumpkins, etc. Only foodstuffs may be grown in the valley, hence its suitability for producing tea, cotton and tobacco is unknown. These, however, are grown in other parts of the country, both in the hills and the *tarai.* Large cardamoms are extensively grown in the eastern hills and form an important article of export. The hemp plant (*Cannabis indica*) grows wild.

Many European fruits, flowers and vegetables have been introduced and grow freely. The country is famous for its oranges and pineapples. Garden and wild flowers are sold for use as religious offerings and for wear in the hair. Apples and pears, of English stock, apricots, peaches and plums do well; grapes grow freely but seldom ripen before the rains begin, when they rot.

Minerals.—The lowest zone abounds in fossils, and deposits of lignite and even of true coal are encountered, the latter notably at a place south of Palpa. The middle zone is rich in limestone, marbles and minerals such as iron, copper, zinc, lead and sulphur. Copper is found near the surface in many places, and there are remains of mines both at Markhu and in the great valley of Nepal. Mineral springs, hot and cold, are numerous. Traces of silver and gold have been found in the alpine zone.

Trade and Manufacture.—All the trade and manufactures of the country are in the hands of the Newars and of a few Kashmiris or natives of India. The trade in European goods is chiefly carried on by the latter, while the Newars deal in corn, oil, salt, tobacco and articles of domestic manufacture. The trade with India is carried on at numerous marts along the frontier, at each of which a customs station is established, and the taxes are collected by a *thikadar* or farmer. The Newars also carry on the trade with Tibet, through a colony which has been established at Lhasa for many years, but this trade has diminished since the opening of the Lhasa-Darjeeling route. There are two principal routes to Tibet. One runs northeast from Kathmandu to the frontier station of Kuti or Nilam, crossing the Himalayan range at a height of 14,000 ft.; the other passes from the valley at the northwest corner and at first runs upward along the main branch of the Gandak, crossing the Himalaya near Kerung at 9,000 ft. All goods on these routes are carried on men's backs, except the salt, etc., carried in bags by the Bhotia sheep and goats.

The Newars are skilful workmen. Their bricks and pottery are good. There are excellent carpenters, though the use of the large saw is still unknown and planks are cut with chisel and mallet. Many of the wood carvings on the temples are of the highest artistic excellence. The modern coinage is struck by machinery, a regular mint having been established by Sir Jung Bahadur at Kathmandu and since improved by his successors.

Government and Law.—Till the fall of the Chinese empire Nepal maintained relations with China and periodically sent an embassy with presents to Peking. The country is in name independent as regards its foreign relations and domestic affairs, but

it was in practice much influenced by India. Until 1951 the government was in the hands of the Rana family, which held from 1846 the right to the position of hereditary prime minister; but in Jan. 1951, under pressure from the Nepal Congress party with whom the king, formerly powerless, had entered into an alliance, the prime minister announced that an assembly would be convened to devise a new constitution and that a cabinet of 14 members, half representing the Congress party, would be formed.

In Nov. 1951 the prime minister was forced to resign in favour of a Congress successor, and the power of the Rana family was thus virtually ended.

The old savage legal code with its ordeals by fire and water and its punishments by mutilation and torture was abolished by the prime minister Sir Jung Bahadur after his return from England in 1851. Treason, rebellion and desertion in wartime are punishable by death, and murder and the killing of cows are also capital offenses. Manslaughter and the maiming of cows are punishable by imprisonment for life, other offenses against the person, property or caste by imprisonment or fine. Brahmans and women are exempt from capital punishment.

The marriage laws are peculiar. Among the Gurkhas the laws resemble those of other Hindus as regards the marriage of widows, polygamy, etc., but among the Newars every girl while still an infant is married with much ceremony to a bel fruit, which is then thrown into some sacred stream. As the fate of the fruit is unknown, a Newari is supposed never to become a widow. At the age of puberty a husband is selected, but the woman can at any moment divorce herself by placing a betel nut under her husband's pillow. Slavery was completely abolished throughout the kingdom in 1925 by the prime minister Gen. Sir Chandra Shumsher Jung.

The revenue is mainly drawn from the land tax, customs, mines, forests and monopolies. About 10% of the *tarai* lands and 20% of the hill lands are private property. Some lands were assigned by the Gorkhali rajas to Brahmans, soldiers and others, and these are untaxed. Others, which were the gifts of the old Newar kings, pay from four to eight annas per *bigha*. A considerable revenue in the shape of royalty is obtained from mines of copper, iron, etc. The taxes on merchandise amount to 12%–14% on the value of the goods carried to and from India and to 5%–6% on goods exported to Tibet.

Army.—The Gorkhalis are a military race. The standing army consists of about 45,000 men, in a fair state of efficiency. There is also a reserve, consisting of men who have served for a few years and taken their discharge but can be called on again to enter the ranks. These would probably raise the strength to between 70,000 and 80,000 men. The regiments are formed on the British system and similarly drilled and officered. Each man carries in addition to a bayonet a *kukri* or native knife. There is practically no cavalry, the country not being suited for horses. The artillery is on a larger scale and consists nearly entirely of mountain guns. There is a large arsenal well provided with supplies of gunpowder and military stores. Rifles and ammunition are for the most part obtained from India.

In addition to its own army, Nepal supplies recruits to Gurkha units of the Indian and British armies.

Education and Health.—There is a college at Kathmandu affiliated with Patna university, and there are many schools in the valley of Nepal. The central institution has three departments, English, Sanskrit and Persian—or more correctly perhaps Urdu.

Kathmandu is a storehouse of ancient Sanskrit literature, and some of the oldest manuscripts in that language known to scholars have been found there. There is also a fair English library.

All families of good position have at least one *baid*, or medical man, in constant attendance, and there are also many general practitioners. There are two large central hospitals, civil and military, at Kathmandu, and other smaller hospitals are distributed over the country, with free beds and provision for outdoor treatment. There is also a small hospital for the British legation. (H. Wn.; X.)

NEPENTHES, an Egyptian drug spoken of by Homer in the *Odyssey* (iv, 221). Generally in the form "nepenthe" the name is given to any drug producing exhilaration and also occasionally to the herb or plant from which such a drug is produced. It is also applied to an interesting genus of plants, comprising 60 species, chiefly East Indian, known as the "pitcher plants" because of the formation of the leaves. Numerous varieties and artificial hybrids of several species, especially *N. ampullaria* and *N. Rafflesiana*, are grown as curiosities in hothouses.

NEPHELINE, a rock-forming mineral consisting of sodium, potassium and aluminum silicate, with the approximate formula $Na_6K_2Al_8Si_9O_{34}$. Its crystals belong to the hexagonal system, and usually have the form of a short six-sided prism terminated by the basal plane. The hardness is 5.5. The specific gravity (2.6), the low index of refraction and the feeble double refraction are nearly the same as in quartz; but since in nepheline the sign of the double refraction is negative, while in quartz it is positive, the two minerals can be distinguished under the microscope. An important determinative character of nepheline is the ease with which it is decomposed by hydrochloric acid, with separation of gelatinous silica (which may be readily stained by colouring matters) and cubes of salt. A clear crystal of nepheline when immersed in acid becomes for this reason cloudy; hence the name, from Gr. νεφέλη, a cloud.

Although in naturally occurring nepheline sodium and potassium are always present in approximately the atomic ratio 3 : 1, artificially prepared crystals have the composition $NaAlSiO_4$; the corresponding potassium compound, $KAlSiO_4$, which is the mineral kaliophilite, has also been prepared artificially. It has therefore been suggested that the orthosilicate formula, $(Na,K)AlSiO_4$, represents the true composition of nepheline, and that the excess of silica is a result of the presence of albite, leucite or silica molecules in "solid solution" in the mineral.

The mineral is specially liable to alteration, and in the laboratory various substitution products of nepheline have been prepared. In nature it is frequently altered to zeolites (especially natrolite), sodalite, kaolin or compact muscovite. Two varieties are distinguished, differing in external appearance and mode of occurrence. "Glassy nepheline" has the form of small, colourless, transparent crystals and grains with a vitreous lustre. It is characteristic of the later volcanic rocks rich in alkalies, such as phonolite, nepheline-basalt, leucite-basalt, etc., and also of certain dike rocks, such as tinguaite. The best crystals are those which occur with mica, sanidine, garnet, etc., in the crystal-lined cavities of the ejected blocks of Monte Somma, Vesuvius. The other variety, known as elaeolite, occurs as large, rough crystals, or more often as irregular masses, which have a greasy lustre and are opaque, or at most translucent, with a reddish, greenish, brownish or gray colour. It forms an essential constituent of certain alkaline plutonic rocks of the nepheline-syenite series, which are typically developed in southern Norway.

The colour and greasy lustre of elaeolite (Gr. ἔλαιον, oil, and λίθος, stone; Ger. *Fettstein*) are caused by the presence of numerous microscopic enclosures of other minerals, possibly augite or hornblende. These enclosures sometimes give rise to a chatoyant effect like that of cat's-eye and cymophane; and elaeolite when of a good green or red colour and showing a distinct band of light is sometimes cut as a gem stone with a convex surface.

NEPHELINE-SYENITE, or Elaeolite-Syenite, a holocrystalline plutonic rock which consists largely of nepheline and alkali feldspar. The rocks are mostly pale coloured, gray or pink, and in general appearance they are not unlike granites, but dark green varieties are also known. They do not contain quartz since that mineral and nepheline are mutually exclusive. From ordinary syenites they are distinguished not only by the presence of nepheline but also by the occurrence of many other minerals rich in alkalis or in rare earths. Orthoclase and albite are the principal feldspars; usually they are intergrown to form perthite. In some rocks the potash feldspar, in others the soda feldspar, predominates. Soda-lime feldspars, such as oligoclase and andesine, are rare or entirely absent. Fresh, clear microcline is very characteristic of some types of nepheline-syenite. Sodalite, colourless and transparent in the slides, but frequently pale blue in the hand specimens, is the principal feldspathoid mineral in addition to nepheline. As a rule, these two crystallize before feldspar, but they may occur in intimate intergrowth with it. The commonest ferromagnesian mineral is pale green augite, which may be surrounded by rims of dark green, pleochroic soda-augite

(aegirine). The latter forms long flat prisms or bundles of radiating needles. The hornblende may be brown, brownish-green, blue or blue-black, belonging as a rule to the varieties which contain soda; it is often intergrown with the pyroxene or enclosed in it. Dark-brown aenigmatite occurs also in these rocks. Olivine is rare, but may be found in some basic forms of nepheline-syenite.

The commonest accessories are sphene, zircon, iron ores and apatite. Cancrinite occurs in several nepheline-syenites; in others there is fluorspar or melanite garnet. Small amounts of primary calcite also occur in some nepheline-syenites. A great number of interesting and rare minerals have been recorded from these rocks and the pegmatite veins which intersect them. Among these may be mentioned eudialyte, eucolite, mosandrite, rinkite, johnstrupite, låvenite, hiortdahlite, perofskite and lamprophyllite. Many of these contain fluorine and the rare earths.

Nepheline-syenites are rare rocks; there is only one occurrence in Great Britain and one each in France and Portugal. They are known also in Bohemia and in several places in Norway, Sweden and Finland. In America these rocks have been found in Texas, Arkansas and Massachusetts, also in Ontario, British Columbia and Brazil. South Africa, Madagascar, India, New South Wales, Tasmania, Timor and Turkestan are other localities for the rocks of this series. They exhibit also a remarkable individuality since each occurrence has its own special features; moreover, a variety of types characterizes each occurrence since these rocks are very variable.

For these reasons, together with the numerous rare minerals they contain, they have attracted a great deal of attention from petrographers.

Many types of nepheline-syenite have received designations derived from the localities in which they were discovered. The laurdalites (from Laurdal in Norway) are gray or pinkish, and in many ways closely resemble the laurvikites of southern Norway, with which they occur. The foyaites include the greater number of known nepheline-syenites and are called after Foya in the Serra de Monchique (southern Portugal), from which they were first described. They are gray, green or reddish, and mostly of massive structure with preponderating potash feldspar, some nepheline and a variable (often small) amount of femic minerals. Pyroxene-, hornblende- and biotite-foyaites have been recognized according to their mineral composition. Examples of the first-named occur in southern Norway with the laurdalites; they contain aegirine and black mica. At Norra Kärr (southern Sweden) pectolite forms an important constituent of a variety of nepheline-syenite (Kaxtorpite). The same mineral occurs in the lujaurites of Sekukuniland (Transvaal). In Transylvania there is a well-known rock of this group, very rich in microcline, blue sodalite and cancrinite. It contains also orthoclase, nepheline, biotite, aegirine, acmite, etc. To this type the name ditroite has been given from the place where it occurs (Ditro). Pyroxene-foyaite has been described also from Pouzac in the Pyrenees (southern France). Mica-foyaite is not very common, but is known at Miask in the Ural mountains (miaskite), where it is coarse-grained, and contains black mica, sodalite and cancrinite.

Hornblende-foyaites occur in Brazil (Serra de Tingua), containing sodalite and often much augite; in the western Sahara and Cape Verde Islands; at Zwarte Koppies, Trans.; Madagascar; São Paulo, Braz.; Paisano pass, west Texas; and Montreal, Que. The rock of Salem, Mass., is a mica-foyaite rich in albite and aegirine; it accompanies granite and essexite.

Litchfieldite is another well-marked type of nepheline-syenite, in which albite is the dominant feldspar. It is named after Litchfield, Me., where it occurs in scattered blocks. Biotite, cancrinite and sodalite are characteristic of this rock. A similar nepheline-syenite is known from Hastings Co., Ont., and contains hardly any orthoclase, but only albite feldspar. Nepheline is very abundant and there is also cancrinite, sodalite, scapolite, calcite, biotite and hornblende. The lujaurites are distinguished from the rocks above described by their dark colour, which is the result of the abundance of minerals, such as augite, aegirine, arfvedsonite and other kinds of amphibole. Typical examples are known at Lujaur Urt, Kola peninsula, where they occur with umptekites and other very peculiar rocks. Other localities for this group are at Julianehaab in Greenland (with sodalite-syenite); at their margins they contain pseudomorphs after leucite. The lujaurites frequently have a parallel banding or gneissose structure.

Sodalite-syenites, in which sodalite very largely or completely takes the place of nepheline, occur in Greenland, where they contain also microcline-perthite, aegirine, arfvedsonite and eudialyte. Cancrinite-syenite, with a large percentage of cancrinite, has been described from Dalecarlia, Swed., and from Finland.

The chemical peculiarities of the nepheline-syenites are well marked, as will be seen from the following analyses. They are exceedingly rich in alkalis and in alumina (hence, the abundance of feldspathoids and alkali feldspars) with silica varying from 50% to 56%, while lime, magnesia and iron are never present in great quantity, though somewhat more variable than the other components. As a group, also, these rocks have a low specific gravity.

	SiO_2	Al_2O_3	FeO	Fe_2O_3	CaO	MgO	K_2O	Na_2O
Laurdalite	54.55	19.07	3.12	2.41	3.15	1.98	4.84	7.67
Ditroite	56.30	24.14	..	1.99	0.69	0.13	6.79	9.28
Litch-fieldite	60.39	22.57	2.26	0.42	0.32	0.13	4.77	8.44
Lujaurite	54.14	20.61	2.08	3.28	1.85	0.83	5.25	9.87

(J. S. F.; X.)

NEPHELINITES. The group of effusive rocks which contains nepheline with plagioclase feldspar is subdivided into nepheline-tephrites and nepheline-basanites, while those which contain nepheline but not feldspar are nephelinites and nepheline-basalts. The tephrites differ from the basanites in the absence of olivine, and the same distinction subsists between the nephelinites and nepheline-basalts.

Lavas with nepheline, plagioclase and augite = nepheline-tephrites; lavas with nepheline, plagioclase, augite and olivine = nepheline-basanites; lavas with nepheline and augite = nephelinites; lavas with nepheline, augite and olivine = nepheline-basalts.

In their essential and accessory minerals, appearance and structure, these rocks have much in common, and tend to occur in a natural association as basic rocks comparatively rich in alkalis and alumina. The nephelinites and tephrites are linked to the phonolites and pass into them by various gradations. They are usually richer in alkalis and silica and contain less iron, lime and magnesia than the basanites and nepheline-basalts, a difference which finds expression in the presence of olivine and the smaller amount of feldspars and feldspathoids in the latter.

Leucite appears in some tephrites; haüyne is more frequent as small dodecahedra often filled with black inclusions. The pyroxene varies a good deal, and includes green aegirine and the purple titan-augite. It has often good crystalline form, and occurs as eight-sided monoclinic prisms. Hornblende is much less common, but biotite is very characteristic of certain nephelinites. Of the feldspars, labradorite is probably the most common, with more acid varieties of plagioclase. Sanidine is by no means absent, but may be considered as an accessory. The olivine presents no peculiarities. Melilite, perofskite, pseudobrookite, melanite garnet, iron oxides, apatite and chromite are occasionally found.

All these rocks are practically confined to lavas of Tertiary and recent ages, though some occur as dikes or small intrusive masses. The plutonic facies of these rocks are found among the theralites, shonkinites, essexites and ijolites. In the British Isles they are exceedingly scarce, though nepheline-basanite occurs in a dike which is presumably Tertiary, cutting the Triassic rocks at Butterton, Staffs., and nepheline-basalt has been found in a single neck at John o' Groat's and at one or two places near North Berwick. They attain a great development in the Canary Islands and in the Azores, Cape Verde Islands and Fernando Noronha. In Germany they are represented among the Tertiary eruptive rocks of the Rhine district and Thuringia, at the extinct craters of the Eifel and at the Kaiserstuhl. In central Bohemia there are many occurrences of nepheline-tephrites, basanites and basalts which though

fine grained contain all their minerals in excellent preservation. The nephelinite of Katzenbuckel in the Odenwald is well known. Contrasted with the phonolites and leucitophyres they are scarce in Italy and the Mediterranean province, but leucite-bearing nepheline-tephrites occur at Monte Vulture and nepheline-basalts in Tripoli. In America these rocks occur in Texas, in the Bearpaw mountains of Montana and at Cripple Creek, Colorado. From Argentina some members have been described: they have a great extension in East Africa (Somaliland and Masai-land) and occur also in North Nigeria. A few also have been described from New South Wales, New Zealand (Dunedin) and Tasmania.

(J. S. F.)

NEPHRITIS: *see* BRIGHT'S DISEASE; KIDNEY, DISEASES OF.

NEPOMUK or **POMUK, JOHN OF,** the national saint of Bohemia. It is necessary to distinguish between the John of Nepomuk of history and the legendary one. A John of Pomuk, son of a German called Wölfel, was vicar-general to the archbishop of Prague, John of Jengenstein, in 1393, and having thwarted King Wenceslaus IV. of Bohemia in a plan to seize the revenues of the abbey of Kladrub, was arrested and tortured, finally being carried to the bridge of Prague and thrown into the Vltava. It is difficult to connect this historical event with the legend of St. John of Nepomuk, who was canonized by Rome in 1729, mainly through the influence of the Jesuits, who hoped that this new cult would obliterate the memory of Hus. The Austrian chronicler Thomas Ebendorffer of Haselbach, who lived two generations later, first states that it was reported that King Wenceslaus had ordered that the confessor of his queen—an office that John of Pomuk never held—should be thrown into the Vltava because he would not reveal the secret of confession. The story is afterwards told in greater detail by the untrustworthy Bohemian historian Wenceslaus Hajek. It appears certain that the person canonized in 1729 was not the historical John of Pomuk or Nepomuk.

See A. H. Wratislaw, *Life, Legend and Canonization of St. John Nepomuk* (1873), a valuable work founded on the best Bohemian authorities; also A. Frind, *Der geschichtliche Heilige Johann von Nepomuk* (1861); O. Abel, *Die Legende vom heiligen Johann von Nepomuk* (1855); and particularly vol. iii. of W. W. Tomek's *History of the Town of Prague* (Czech) (12 vols., Prague, 1855–1901).

NEPOS, CORNELIUS (*c.* 99–24 B.C.), Roman historian, friend of Catullus, Cicero and Atticus, was born in Upper Italy (perhaps at Verona or Ticinum). He wrote: *Chronica,* an epitome of universal history; *Exempla,* a collection of anecdotes; letters to Cicero; lives of Cato the elder and Cicero; and *De viris illustribus,* parallel lives of distinguished Romans and foreigners, in sixteen books. One section of this work (more commonly known as *Vitae excellentium imperatorum*) and the biographies of Cato and Atticus from another (*De Latinis historicis*), have been preserved. Erotic poems and a geographical treatise are also attributed to him. The *Lives* contain many errors (especially in chronology), but supply information not found elsewhere. The language is as a rule simple and correct. The *Lives* were formerly attributed to Aemilius Probus of the 4th century A.D.; but the view maintained by Lambinus (in his famous edition, 1569)—that they are all the work of Nepos—is now generally accepted. In modern times G. F. Unger (*Der sogenannte C. N.*, 1881) has attempted to prove that the author was Hyginus, but his theory has not been favourably received.

Editions of the *Lives* (especially selections) are extremely numerous; text by E. O. Winstedt (Oxford, 1904), C. L. Roth (1881), C. G. Cobet (1881), C. Halm and A. Fleckeisen (1889), with lexicon for school use; with notes, O. Browning and W. R. Inge (1888), J. C. Rolfe (U.S. 1894), A. Weidner and J. Schmidt (1902), C. Erbe (1892), C. Nipperdey and B. Lupus (ed. maj., 1879, school ed., 1895), J. Siebelis and O. Stange (1897).

NEPOS, JULIUS, emperor of the West (474–475), was the nephew and successor of Marcellinus, count of Dalmatia. Being connected by marriage with Leo I., he was selected by him as emperor after the death of Olybrius. After capturing his rival Glycerius, he was recognized as emperor in Italy, Rome and Gaul. The only event of his reign was the cession of Auvergne to the Visigoths. Nepos was overthrown in 475 by the Patrician Orestes, and fled to Salona, where he was assassinated (480 or 481), possibly at the instigation of Glycerius, who had been compelled to enter the Church.

NEPTUNE (*Neptunus,* Etruscan *Nethuns*). An Italian god of fresh water, associated with Salacia (? from *salire,* referring to the bubbling of springs). Not later than 399 B.C. (*see* Livy, v. 13, 6), he was identified with Poseidon (*q.v.*) and henceforth was known as a sea-god.

Neptune's ancient festival (Neptunalia) was on July 23; *i.e.,* in the heat of summer, when water is most wanted and streams are drying up. He had no temple until the 3rd century B.C., so far as we know; it was near the Circus Flaminius.

In like manner Portunus, originally the god of city gates (*portae*) became god of harbours (*portus*) as Roman overseas trade became important.

See Wissowa, *Religion und Kultur,* 2nd ed., p. 225.

NEPTUNE—astronomical symbol ♆—is one of the nine planets of the solar system. Its mean distance from the sun is 30.1 times that of the earth; its period of revolution 164.8 years.

Neptune is so far from the sun and from the earth that it is invisible without optical aid, but a telescope of moderate aperture reveals it as a very small disk of greenish hue about 2.3 seconds of arc in diameter, equal in brightness to an eighth magnitude star. Although no surface markings can be seen on its apparent surface, which is the top of an extensive opaque or cloud-filled atmosphere, Neptune's rotation period, 16 hours, has been determined from spectroscopic observations of its equatorial speed of rotation. The direction of rotation is the same as that of the earth.

The mass of the planet, which can be accurately determined from the motion of its satellite, is 17.2 times that of the earth; its diameter is 31,000 miles; and its mean density 1.6 times that of water, or 0.29 that of the earth.

Although Neptune shines by reflected sunlight, its colour is quite greenish because much of the red in the incident solar light is absorbed in Neptune's atmosphere.

The spectrum shows that this absorption, like that in the atmospheres of Jupiter, Saturn and Uranus, is due primarily to strong bands of methane (CH_4). The bands due to methane are more intense in the spectrum of Neptune than in that of Jupiter; those due to ammonia (NH_3) are much weaker.

Because of Neptune's great distance from the sun, its temperature must be very low, probably not higher than −330° F.

Neptune's Satellite.—Neptune, like the earth, has only one satellite. It was discovered by William Lassell in 1846, less than a month after the discovery of Neptune. Although it has been called Triton, it is more generally known simply as "the satellite of Neptune." It revolves around Neptune at a distance of 220,000 miles with a period of 5 days 21^h 2^m and 38^s in a plane inclined 40° to Neptune's orbit. The direction of its motion is opposite to that of Neptune's rotation. The mass of Neptune's satellite, which has been accurately determined from its effect on the motion of Neptune, is 0.0013 that of Neptune.

From the motion of the plane of the satellite's orbit and the period of Neptune's rotation, the oblateness of the planet and the nature of its internal constitution can be inferred. From such deductions it is concluded that internally Neptune closely resembles Jupiter.

The Discovery of Neptune.—By far the most interesting thing about Neptune is the story of its discovery. The account which follows was written by the late Professor Simon Newcomb.

The detection of Neptune through its action upon Uranus before its existence had been made known by observation is a striking example of the precision reached by the theory of the celestial motions. So many agencies were concerned in the final discovery that the whole forms one of the most interesting chapters in the history of astronomy.

The planet Uranus, before its actual discovery by Sir William Herschel in the year 1781, had been observed as a fixed star on at least 17 other occasions, beginning with Flamsteed in 1690. In 1820 Alexis Bouvard of Paris constructed tables of the motion of Jupiter, Saturn and Uranus, based upon a discussion of observations up to that year. Using the mutual perturbations of these planets as developed by Laplace in the *Mé-*

canique Céleste, he was enabled satisfactorily to represent the observed positions of Jupiter and Saturn; but the case was entirely different with Uranus. It was found impossible to represent all the observations within admissible limits of error, the outstanding differences between theory and observation exceeding 1′. In these circumstances one of two courses had to be adopted, either to obtain the best general representation of all the observations, which would result in the tables being certainly erroneous, or to reject the older observations which might be affected with errors, and base the tables only on those made since the discovery by Herschel. A few years of observation showed that Uranus was deviating from the new tables to an extent greater than could be attributed to legitimate errors of theory of observation, and the question of the cause thus became of growing interest. Among the investigators of the question was F. W. Bessel, who tried to reconcile the difficulty by an increase of the mass of Saturn, but found that he could do so only by assigning a mass not otherwise admissible. Although the idea that the deviations were probably due to the action of an ultra-Uranian planet was entertained by Bouvard, Bessel and doubtless others, it would seem that the first clear statement of a conviction that such was the case, and that it was advisable to reach some conclusion as to the position of the disturbing body, was expressed by the Rev. T. J. Hussey, an English amateur astronomer. In a letter to Sir George B. Airy in 1834 he inquired Airy's views of the subject, and offered to search for the planet with his own equatorial if the required estimate of its position could be supplied. Airy expressed himself as not fully satisfied that the deviation might not arise from errors in the perturbations. He therefore was not certain of any extraneous action; but even if there was, he doubted the possibility of determining the place of a planet which might produce it. In 1837 Bouvard, in conjunction with his nephew Eugène, was again working on the problem; but they appear not to have gone farther than to collect observations and to compare the results with Bouvard's tables.

In 1835 F. B. G. Nicolai, director of the observatory at Mannheim, in discussing the motion of Halley's comet, considered the possibility that it was acted upon by an ultra-Uranian planet, the existence of which was made probable by the disagreement between the older and more recent observations.

In 1838 Airy showed in a letter to the *Astronomische Nachrichten* that not only the heliocentric longitude, but the tabulated radius vector of Uranus was largely in error, but made no suggestions as to the cause. In 1843 the Royal Society of Sciences of Göttingen offered a prize of 50 ducats for a satisfactory working up of the whole theory of the motions of Uranus, assigning September 1846 as the time within which competing papers should be presented. It is also recorded that Bessel, during a visit to England in 1842, in a conversation with Sir John Herschel, expressed the conviction that Uranus was disturbed by an unknown planet. He went so far as to set his assistant Fleming at the work of reducing the observations, but died before more was done.

The question had now reached a stage when it needed only a vigorous effort by an able mathematician to solve the problem. Such a man was found in John Couch Adams, then a student of St. John's College, Cambridge, who seriously attacked the problem in 1843, the year in which he took his bachelor's degree. He soon found that the observations of Uranus could be fairly well represented by the action of a planet moving in a radius of twice the mean distance of Uranus, which would closely correspond to Bode's law. During the two following years he investigated the possible eccentricity of the orbit, and in September 1845 communicated his results to Professor James Challis. In 1845, about the 1st of November, Adams also sent his completed elements to Airy, stating that according to his calculations the observed irregularities in the motion of Uranus could be accounted for by the action of an exterior planet, of which the motions and orbital elements were given. It is worthy of note that the heliocentric longitude of the unknown body as derived from these elements is only between one and two degrees in error, while the planet was within half a degree of the ecliptic. Two or three evenings assiduously devoted to the search could not therefore have failed to make the planet known. Adams's paper was accompanied by a comparison of his theory with the observations of Uranus from 1780, showing an excellent agreement. Airy in replying to this letter inquired whether the assumed perturbation would also explain the error of the radius-vector of Uranus, which he seemed to consider the crucial test of correctness.

The Elements.—At Arago's suggestion the investigation had been taken up by U. J. J. Leverrier, who had published some excellent work in theoretical astronomy. Leverrier's first published communication on the subject was made to the French Academy on the 10th of November 1845, a few days after Adams's results were in the hands of Airy and Challis. A second memoir was presented by Leverrier in 1846 (June 1). His investigation was more thorough than that of Adams. He first showed that the observations of Uranus could not be accounted for by the attraction of known bodies. Considering in succession various explanations, he found none admissible except that of a planet exterior to Uranus. Considering the distances to be double that of Uranus he then investigated the other elements of the orbit.

The following are the elements found by Adams and Leverrier:

	Leverrier	Adams	
		Hypothesis I	Hypothesis II
Semi-major axis	36·154	38·38	37·27
Eccentricity	0·1076	0·16103	0·12062
Long. of perihelion	284° 45′	315° 57′	299° 11′
Mean longitude	318° 47′	325° 8′	323° 2′
Epoch	1847, Jan. 1	1846, Oct. 1	1846, Oct. 1
True longitude	326° 32′	328°	329°

The longitude of the planet was 327° 57′ on Oct. 1, 1846.

The close agreement of these elements led Airy to suggest to Challis, on the 9th of July 1846, a search for the planet with the Northumberland telescope. He proposed an examination of a part of the heavens 30° long in the direction of the ecliptic and 10° broad, and estimated the number of hours' work likely to be employed in this sweep. The proposed sweeps were commenced by Challis on the 29th of July. The plan required each region to be swept through twice, and the positions of all the known stars found to be compared, in order that the position of the planet might be detected by its motion. On the 31st of August Leverrier's concluding paper was presented to the French Academy, and on the 18th of September he wrote to John G. Galle (1812–1910), then chief assistant at the Berlin observatory, suggesting that he should search for the computed planet, with the hope of detecting it by its disk, which was probably more than 3″ in diameter. This letter, probably received on the 23rd of September, was communicated to J. F. Encke, the director of the observatory, who approved of the search. H. L. d'Arrest, a student living at the observatory, expressed a wish to assist. In the evening the search was commenced, but it was not found possible to detect any planet by its disk. Star charts were at the time being prepared at the observatory under the auspices of the Berlin Academy of Sciences. It was suggested by d'Arrest that this region might be covered by one of the charts. Referring to the chart, which was lying in a drawer, it was found that such was the case. Comparing the stars on the chart one by one with the heavens it was found that an eighth magnitude star now visible was not on the chart. This object was observed until after midnight, but no certain motion was detected. On the following evening the object was again looked for, and found to have moved. The existence of the planet was thus established. It was afterwards found that Challis had observed the planet on Aug. 4, but had failed to detect it.

The question whether Leverrier should receive the sole credit of the discovery was warmly discussed. Arago took the extreme ground that actual publication alone should be considered, rejecting Adams's communications to Airy and Challis as quite unworthy of consideration. He also suggested that the name of Leverrier should be given to the planet, but this proposal was received with so little favour outside of France that he speedily withdrew it, proposing that of Neptune instead.

The observations at the first opposition showed that the planet was moving in a nearly circular orbit, and was at a mean distance from the sun much less than that set by Leverrier as the smallest possible. The latter had in fact committed the error of determining the limits by considering the variations of the elements one at a time, assuming in the case of each that while it varied the others remained constant. But a simultaneous variation of all the elements would have shown that the representation of the observations of Uranus would be improved by a simultaneous diminution of both the eccentricity and the mean distance, the orbit becoming more nearly circular and the planet being brought nearer to the sun. But this was not at first clearly seen, and Benjamin Peirce of Harvard University went so far as to maintain that there was a discontinuity between the solution of Adams and Leverrier and the solution offered by the planet itself, and that the coincidence in direction of the actual and computed planet was an accident. But this view was not well founded, and the only explanation needed was to be found in Leverrier's faulty method of determining the limits within which the planet must be situated. As a matter of fact the actual motion of the planet during the century preceding, as derived from Leverrier's elements, was much nearer the truth than the elements themselves were. This arose from the fact that his very elliptic orbit, by its large eccentricity, brought the planet near to the sun, and therefore near to its true position, during the period from 1780 to 1845, when the action on Uranus was at its greatest.

The observations of the first opposition enabled Sears Cook Walker of the National Observatory, Washington, in February 1847 to compute the past positions of the planet, and identify it with a star observed by Lalande at Paris in May 1795. This being communicated to the Paris observatory, an examination of Lalande's manuscript showed that he had made two observations of the planet, on the 8th and 10th of May and finding them discordant had rejected one as probably in error, and marked the other as questionable. A mere re-examination of the region to see which observation was in error would have led him to the discovery of the planet more than half a century before it was actually recognized. The identity of Lalande's star with Neptune was also independently shown by Petersen of Altona.

Bibliography.—The principal sources for the history of the discovery of Neptune are the *Astronomische Nachrichten*, vols. xxv., xxvi., xxviii., and Lindenau's paper in the *Ergänzungsheft* to this publication, pp. 1–31 (Altona, 1849). In the *Memoirs of the Royal Astronomical Society*, vol. xvi., Airy gave a detailed history of the circumstances connected with the discovery, so far as he was cognizant of them. Documents pertaining to the subject are found in the *Monthly Notices of the Royal Astron. Society*. B. A. Gould, *Report to the Smithsonian Institution on the History of the Discovery of Neptune*, published by the Smithsonian Institution (Washington, 1850), is the most complete and detailed history of all the circumstances connected with the discovery, and with the early investigations on the orbit of the planet, that has been published. Leverrier's investigation was published *in extenso* as an addition to the *Connaissance des temps*, and Adams's as an appendix to the *Nautical Almanac* for 1851. Peirce's discussions, so far as published at all, are found in the *Proceedings of the American Academy of Arts and Sciences*. The first computations of the orbit after the discovery were made by Sears Cook Walker, and published by the Smithsonian Institution (1848–1850). General tables of the motion of Neptune are in Kowalski's *Tables du mouvement de la planète Neptune;* Newcomb's *Investigation of the Orbit of Neptune*, Washington, Smithsonian Institution (1866); Leverrier's *Annales de l'Observatoire de Paris; Memoirs*, vol. xiv. (1877), and lastly Newcomb's "Tables" in *Astron. Papers of the American Ephemeris*, vol. vii., part iv.

NEPTUNIUM: *see* Transuranium Elements.

NÉRAC, a town of France, in the department of Lot-et-Garonne, 16 mi. W.S.W. of Agen by road. Pop. (1946) 3,836. Nérac in the 11th century was a possession of the monks of St. Pierre de Condom. The lords of Albret deprived them of their authority and at the beginning of the 14th century founded a castle on the Baise. Nérac, the inhabitants of which had adopted the Reformed religion, was seized by the Catholics in 1562.

The conferences, held there at the end of 1578 between the Catholics and Protestants, ended in the peace of Nérac, 1579. In 1580 the town was used by Henry IV as a base for attacks on the Agenais, Armagnac and Guienne. A Chambre de l'Edit for Guienne and a Chambre des Comptes were established there by Henry IV. In 1621, however, the town took part in the Protestant rising, was taken by the troops of Louis XIII and its fortifications dismantled. Soon after it was deprived both of the Chambre de l'Edit and of the Chambre des Comptes, and its ruin was completed by the revocation of the Edict of Nantes in 1685. The town, once the capital of the dukes of Albret, is divided by the Baise into Grand-Nérac and Petit-Nérac. The river is spanned by the 16th century bridge of Pont Vieux, and by the Pont Neuf, of modern construction. From the left bank a staircase leads to the rue Henri Quatre, where stands a wing of the castle in which Henry IV lived. The former palace of the Chambre des Comptes is now occupied by the tribunal of commerce, the library and the museum. The remains of a Roman villa have been found near the promenade of La Garenne. A road leads from the south end of La Garenne to the ruins of the feudal castle of Nazareth. The Château du Tasta of the 15th century is within a short distance of Nérac. The industries include brewing and cork-working. It has a large trade in wines, brandy, corks, fruit and vegetables.

NERBUDDA: *see* Narbada.

NERCHINSK, a town of Asiatic Russia, in the Sretensk district of the Far Eastern area, in lat. 52° 10′ N., long. 116° 32′ E., on the left bank of the Nercha, 2½ m. above its confluence with the Shilka. Population 15,300. It is a centre for the collection of furs, cattle and brick-tea from China and for the distribution of manufactured goods imported from industrial Russia. There are tanneries, candle factories and a fur coat factory. The town is a market for the agricultural products of the fertile river valley.

The fort dates from 1654, and the town was founded in 1658 by Pashkov, who in that year opened direct communication between the Russian settlements in Transbaikalia and those on the Amur which had been founded by Cossacks and fur-traders coming from the Yakutsk region. In 1689 was signed between Russia and China the Treaty of Nerchinsk, which stopped for two centuries the further advance of the Russians into the basin of the Amur. After that Nerchinsk became the chief centre for the trade with China. The opening of the western route through Mongolia, by Urga, and the establishment of a custom-house at Kiakhta in 1728 diverted this trade into a new channel. But Nerchinsk acquired fresh importance from the influx of immigrants into eastern Transbaikalia, the discovery of rich mines and the arrival of great numbers of convicts. In 1812 it was transferred from the banks of the Shilka to its present site.

NERCHINSK (in full Nerchinskiy Zavod), a town and silver-mine of Asiatic Russia in the Sretensk district of the Far Eastern Area, in lat. 51° 59′ N., long. 116° 39′ E., 150 mi. E.S.E. of another Nerchinsk (*q.v.*) (with which it is often confused), on a small affluent of the Argun. Population 3,153. It has a chemical laboratory for mining purposes, and a meteorological and magnetic observatory (51° 18′ N., 119° 37′ E., 2,200 ft. above sea-level) founded in 1842. The average yearly temperature is 25·3° F, with extremes of 97·7° and −52·6°.

Nerchinsk Mining District (29,450 sq.m.) includes all the silver, lead and tin mines and gold-fields between the Shilka and the Argun, together with a few on the left bank of the Shilka. It is traversed by several parallel chains of mountains which rise to 4,500 ft., and are intersected by a complicated system of deep, narrow valleys, densely wooded, with a few expansions along the larger rivers, where the inhabitants with difficulty raise some rye and wheat. The Nerchinsk mountains, not yet fully surveyed, form the watershed between the streams flowing south-east into the Argun and the Onon, Unda and Shilka on the north-west. They consist of crystalline slates and limestones interspersed with granite, syenite and diorite; they contain rich ores of silver, lead, tin and iron, while the diluvial and alluvial valley formations contain auriferous sands; asbestos is found near the tin.

The Nerchinsk silver mines began to be worked in 1704, but during the first half of the 18th century their yearly production did not exceed 8,400 oz., and the total amount for the first 150 years (1704–1854) amounted to 11,540,000 ounces. Transport

and climatic difficulties have prevented the exploitation of the minerals in the region and the silver mines were closed in 1900. If the present scheme of linking the mines to the main railway is carried out, production may redevelop. The more easily reached veins of silver have been exhausted and expensive plant would be needed to work the deeper veins. Gold was first discovered in 1830, and between 1833 and 1855 260,000 oz. of gold dust were obtained. In 1864 a large number of auriferous deposits were discovered.

Until 1863 all the labour was performed by serfs and convicts, numbering usually nearly four thousand.

NEREUS, in Greek mythology, the eldest son of Pontus and Gē, and father of the Nereïds. He is represented as a beneficent and sage old man of the sea. The only myth concerning him is that Heracles compelled him, although, like Proteus, he assumed various forms, to tell him the way to the Hesperides (Apollodorus ii. 115).

The Nereïds are mermaids. Amphitrite (consort of Poseidon) and Thetis (*see* Peleus) are the best known; Galatea is a Sicilian figure, loved by the Cyclops Polyphemus. The name has nothing to do with the modern Greek *νερόν* (really *νεαρόν*, "fresh" [water]).

NERGAL, the name of a solar deity in Babylonia, the main seat of whose cult was at Kutha or Cuthah, represented by the mound of Tell-Ibrahim. The importance of Kutha as a religious and at one time also as a political centre led to his surviving the tendency to concentrate the various sun-cults of Babylonia in Shamash (*q.v.*). He becomes, however, the representative of a certain phase only of the sun and not of the sun as a whole. Portrayed in hymns and myths as a god of war and pestilence, Nergal represents the sun of noon-time and of the summer solstice which brings destruction to mankind. Nergal is pictured also as the deity who presides over the nether-world, and stands at the head of the special pantheon assigned to the government of the dead, who are supposed to be gathered in a large subterranean cave known as Arallis or Irkalla. In this capacity there is associated with him a goddess Allatu or Ereshkigal, though there are indications that at one time Allatu was regarded as the sole mistress of Arâlu. Ordinarily the consort of Nergal is Laz. Nergal was pictured as a lion and his symbol is a griffin with panther's head, sometimes supporting his other symbol, a weapon with two panther heads.

As in the case of Nin-urta, Nergal appears to have absorbed a number of minor solar deities, which accounts for the various names or designations under which he appears, such as Lugalgira, Sharrapu ("the burner," perhaps a mere epithet), Ira or Gira, Gibil (though this name more properly belongs to Nusku, *q.v.*). A certain confusion exists in cuneiform literature between Nin-urta and Nergal, perhaps due to the traces of two different conceptions regarding these two solar deities. Nergal is called the "raging king," the "furious one," and the original Sumerian name consists of three elements, Ne-urugal, "might of the great dwelling" and thus at the head of the nether-world a pantheon is indicated. In the astral-theological system he is the planet Mars, while in ecclesiastical art the great lion-headed colossi serving as guardians to the temples and palaces seem to be a symbol of Nergal, just as the bull-headed colossi probably typify Nin-urta.

The name of his chief temple at Kutha was E-shid-lam, from which the god receives the designation of Shidlamtäea, "the one that rises up from Shidlam." The cult of Nergal does not appear to have been as widespread as that of Nin-urta. He is frequently invoked in hymns and in votive and other inscriptions of Babylonian and Assyrian rulers, but we do not learn of many temples to him outside of Kutha. Sennacherib speaks of one at Tarbisu to the north of Nineveh, but although Nebuchadrezzar II. (606–586 B.C.), the great temple-builder of the neo-Babylonian monarchy, alludes to his operations at E-shid-lam in Kutha, he makes no mention of a sanctuary to Nergal in Babylon. Local associations with his original seat—Kutha—and the conception formed of him as a god of the dead acted in making him feared rather than actively worshipped. He is often spoken of as a god who passed judgment on the souls of the dead, and in the late period arose the theory of compensation at his hands in Arallu for the righteous, and thus arose the late Hebrew belief in rewards after death to explain the problem of providence.

NERI, PHILIP (Filippo de), Saint (1515–1595), Italian churchman, was born at Florence on July 21, 1515, the youngest child of Francesco Neri, a lawyer of that city, and his wife Lucrezia Soldi. He received his early teaching from the friars at San Marco, the famous Dominican monastery in Florence. At sixteen Philip was sent to his uncle, Romolo, a merchant at San Germano, to assist him in his business, and with the hope that he might inherit his possessions. But in 1533 Philip went to Rome, where he acted as a private tutor, and was able to study under the Augustinians, and to begin those labours amongst the sick and poor which gained him in later life the title of "Apostle of Rome." His nights were spent in prayer and meditation in the churches of the city and in the catacombs. In 1538 he began his missionary work; somewhat in the manner of Socrates he traversed the city, seizing opportunities of entering into conversation with persons of all ranks, and of leading them on, with playful irony, questions and counsel, to consider the topics he desired to set before them.

In 1548 he founded the confraternity of the Santissima Trinità de' Pellegrini e de' Convalescenti, to minister to the thousands of poor pilgrims to Rome, and also to relieve the patients discharged from hospitals. In 1551 he was ordained priest. He settled, with some companions, at the hospital of San Girolamo della Carità, and while there tentatively began, in 1556, the institute with which his name is more especially connected, that of the Oratory. The scheme at first was for a series of evening meetings in a hall (the Oratory), at which there were prayers, hymns, readings from Scripture, from the fathers, and from the *Martyrology,* followed by a lecture, or by discussion of some religious question proposed for consideration. The musical selections (settings of scenes from sacred history) were called *oratorios.* In 1564 the Florentines invited Philip to take charge of their church in Rome, San Giovanni dei Fiorentini, then newly built. At this time the new society included amongst its members Caesar Baronius, the ecclesiastical historian, Francesco Maria Tarugi, afterwards archbishop of Avignon, and Paravicini, all three subsequently cardinals, and also Gallonius, author of a work on the *Sufferings of the Martyrs,* Ancina, Bordoni, and other men of ability and distinction.

The Florentines, however, built in 1574 a large oratory or mission-room for the society contiguous to San Giovanni. Eventually the society took the church of Santa Maria in Vallicella, in the middle of Rome. The building was pulled down, and a splendid church erected on the site. Neri then formally organized, under permission of a bull dated July 15, 1575, a community of secular priests, entitled the Congregation of the Oratory. The new church was consecrated early in 1577, but Neri himself did not migrate from San Girolamo till 1583, and then only in virtue of an injunction of the pope that he, as the superior, should reside at the chief house of his congregation. He was at first elected for a term of three years (as is usual in modern societies), but in 1587 was nominated superior for life. He desired that all congregations formed on his model outside Rome should be autonomous, a regulation formally confirmed by a brief of Gregory XV. in 1622. Neri's only interference in political matters was in 1593, when he induced Clement VIII to withdraw the excommunication and anathema of Henry IV. of France. Neri administered the Oratory until his death (May 26, 1595) at Rome. He was succeeded by Baronius. Neri was beatified by Paul V. in 1600, and canonized by Gregory XV. in 1622.

Theiner and Hilgers in Wetzer und Welte's *Kirchenlexicon,* and by Reuchlin and Zöckler in Herzog-Hauck's *Realencyklopädie.* Neri's works include *Ricordi,* or *Advice to Youth, Letters* (Padua, 1751), and a few sonnets printed in the collection of the *Rime Oneste.* Lives by Mrs. Hope (London, 1859); Abp. Capecelatro (2 vols., 1879; 2nd ed., 1884; Eng. trans., 1882; 2nd ed. by T. A. Pope, 1894).

NERNST, WALTER (1864–1941), German physical chemist, was born on June 25, 1864, at Briesen, West Prussia. He became an assistant to Wilhelm Ostwald (*q.v.*) at the University of Leipzig. He was named professor of physical chemistry at Göttingen in 1894. In 1905 he was appointed ordinary professor of physical chemistry in the University of Berlin, and in 1922 became the director of the Physikalisch-technischen Reichsanstalt, Charlottenburg, a position he held until 1924. In 1925 he became director of the Physical Institute in the University of Berlin.

On the technical side Nernst is known for the invention of an electric glow lamp which was more efficient, although more complicated than the old carbon lamps. The Nernst lamp is still used in scientific work to a small extent as a concentrated source of light. In physical chemistry Nernst is responsible for a great deal of the fundamental work on reversible galvanic cells. In 1889 he showed that the production of electromotive force in galvanic cells could be explained in terms of "solution pressure" of the metal electrodes tending to send charged ions into the solution, this tendency being balanced by the osmotic pressure of the dissolved ions. In 1889 he also introduced the important theory of solubility product in explaining precipitation reactions. He studied diffusion in solutions, including liquid contact potentials, and in 1918 put forward the "atom chain reaction" theory in photochemistry. With H. von Wartenberg he devised a method for measuring vapour densities at very high temperatures; they investigated the dissociation of various elements and compounds. Nernst is noted for the statement of the so-called third law of thermodynamics (heat theorem), and for initiating important measurements of specific heats at low temperatures from the standpoint of the quantum theory. In 1920 he received the Nobel prize for chemistry. He died Nov. 18, 1941, at Berlin. In 1951 his ashes were reinterred at Göttingen. (R. E. O.)

NERO (Nero Claudius Caesar Augustus Germanicus) (A.D. 37–68), Roman emperor 54–68, was born at Antium on Dec. 15, 37. He was the son of Gnaeus Domitius Ahenobarbus and Agrippina the younger, and his name was originally L. Domitius Ahenobarbus. His father died when Nero was scarcely three years old. In the previous year (39) his mother had been banished by order of her brother Caligula (Gaius), and Nero found shelter in the house of his aunt Domitia. The emperor Claudius recalled Agrippina, who spent the next 13 years in a struggle to obtain the succession of the throne for Nero. She married Claudius in 49, and in 50 he adopted Nero as his son. Seneca was recalled from exile to be his tutor. On his 14th birthday he assumed the *toga virilis*, and was introduced to the Senate by Claudius with the title of *princeps inventutis*. This made his succession almost certain, and Agrippina subsequently got rid of the partisans of Britannicus and installed Burrus as praefect of the praetorian guard.

Succession.—In 52, in Claudius' absence, Nero was praefect of the city. He married Claudius' daughter Octavia. On Oct. 13, 54 Claudius died, poisoned by Agrippina's orders and Nero was presented to the soldiers on guard as their new sovereign. From the palace steps he proceeded to the praetorian camp, and thence to the senate-house, where he was made emperor.

Agrippina's bold stroke had been completely successful. Only a few voices were raised for Britannicus; nor is there any doubt that Rome was prepared to welcome the new emperor with genuine enthusiasm. His prestige and his good qualities, carefully fostered by Seneca, made him popular, while his darker passions were as yet unsuspected. His first acts confirmed this favourable impression. He modestly declined the title of *pater patriae*; the memory of Claudius, and that of his own father Domitius were duly honoured. He promised to follow the principles of Augustus, and his clemency, liberality and affability were the talk of Rome.

Much of the credit of all this is due to Seneca and Burrus. Seneca had seen from the first that the real danger with Nero lay in the savage vehemence of his passions, and he made it his chief aim to stave off by every means in his power the dreaded outbreak. The policy of indulging his tastes and helping him to enjoy the sweets of popularity without the actual burdens of government succeeded for the time. During the first five years of his reign, little occurred to damp the popular enthusiasm. Nero's promises were fulfilled, and the senate found itself free to discuss and even to decide important administrative questions. Abuses were remedied, the provincials protected from oppression, and the burdens of taxation lightened. On the frontiers no serious disaster occurred, and even the murder of Britannicus was accepted as a necessary measure of self-defence. But an essential part of Seneca's policy was to remove Nero from the influence of his mother.

Agrippina's Eclipse.—In 55, he found a powerful ally in Nero's passion for the beautiful freedwoman Acte, a passion which he deliberately encouraged. Agrippina's angry remonstrances served only to irritate Nero, and caresses equally failed. She then threatened to espouse the cause of Britannicus. Nero retaliated by poisoning Britannicus. Agrippina then tried to win over Nero's neglected wife Octavia, and to form a party of her own. Nero dismissed her guards, and placed her in a sort of honourable confinement (Tac. *Ann.* xiii. 12–20). During nearly three years she disappears from the history, and with her retirement things again for the time went smoothly. In 58 Nero was enslaved by Poppaea Sabina, a woman of a very different stamp from her predecessor. She was resolved to be Nero's wife, and her first object was the removal of Agrippina. By rousing Nero's jealousy and fear she induced him to seek her death, with the aid of a freedman Anicetus, praefect of the fleet of Misenum. Agrippina was invited to Baiae, and after an affectionate reception, was conducted on board a vessel so constructed as, at a given signal, to fall to pieces. But Agrippina saved herself by swimming, and wrote to her son, announcing her escape, and affecting entire ignorance of the plot. A body of soldiers under Anicetus then surrounded her villa, and murdered her in her own chamber. Nero was horrorstruck at the enormity of the crime and terrified at its possible consequences. But a six months' residence in Campania, and the congratulations which poured in upon him from the neighbouring towns, where the report had been officially spread that Agrippina had fallen a victim to her treacherous designs upon the emperor, gradually restored his courage. In Sept. 59 he re-entered Rome amid universal rejoicing. Races, exhibitions and games in the Greek fashion rapidly succeeded each other.

Poppaea.—The result of the death of Agrippina was the growing influence over Nero of Poppaea and her friends. In 62 Burrus died, it was said by poison, and Seneca retired from his post. Their place was filled by Poppaea, and the infamous Tigellinus, whose sympathy with Nero's sensual tastes had gained him the command of the praetorian guards in succession to Burrus. The fear of conspiracy was skilfully used by them to direct Nero's suspicions against possible opponents. Cornelius Sulla, who had been banished to Massilia in 58, was put to death on the ground that his residence in Gaul was likely to arouse disaffection in that province, and a similar charge proved fatal to Rubellius Plautus, who had for two years been living in retirement in Asia. Nero's taste for blood thus whetted, Octavia was divorced, banished to the island of Pandateria and murdered. Poppaea's triumph was now complete. She was married to Nero; her head appeared on the coins with his; and her statues were erected in the public places of Rome.

In the course of 61 occurred the rebellion of Boudicca (Boadicea) and the Iceni in Britain, resulting in the sack of Colchester and the destruction of the ninth legion before it was suppressed by Suetonius Paulinus. Further disasters were the destruction of Pompeii and the evacuation of Armenia in 63.

The Burning of Rome.—A far deeper and more lasting impression was produced by the great fire in Rome. The fire broke out on the night of July 18, 64, among the wooden booths at the south-east end of the Circus Maximus. Thence in one direction it rapidly spread over the Palatine and Velia up to the low cliffs of the Esquiline, and in another it laid waste the Aventine, the Forum Boarium and Velabrum till it reached the Tiber and the solid barrier of the Servian wall. After burning fiercely for six days it started afresh and desolated the regions of the Circus Flaminius and the Via Lata, and after it was finally quenched only four of the 14 *regiones* remained untouched; three had been utterly destroyed and seven reduced to ruins. The conflagration is said by all authorities later than Tacitus to have been deliberately caused by Nero himself. But Tacitus, though he mentions the rumours,

declares that its origin was uncertain, and in spite of such works as Profumo's *Le fonti ed i tempi dello incendio Neroniano* (1905), there is no proof of his guilt. By Nero's orders, the open spaces in the Campus Martius were utilized to give shelter to the homeless crowds, provisions were brought from Ostia and the price of corn lowered. In rebuilding the city every precaution was taken against the recurrence of such a calamity. Broad regular streets replaced the narrow winding alleys. The new houses were limited in height, built partly of hard stone and protected by open spaces.

This disaster undoubtedly told against Nero, being widely regarded as evidence of the wrath of the gods. The work of rebuilding included the erection of Nero's famous palace, the "golden house," and the laying-out of its wonderful grounds.

To defray the enormous cost, Italy and the provinces, says Tacitus, were ransacked, and in Asia and Achaia especially the rapacity of the imperial commissioners recalled the days of Mummius and of Sulla. It was the first occasion on which the provincials had suffered from Nero's rule, and the discontent it caused helped to weaken his hold over them at the very moment when the growing dissatisfaction in Rome was gathering to a head. Early in 65 Nero was panic-stricken by the discovery of a conspiracy involving such men as Faenius Rufus, Tigellinus's colleague in the prefecture of the praetorian guards, Plautius Lateranus, one of the consuls elect, the poet Lucan, and, lastly, not a few of the tribunes and centurions of the praetorian guard itself. Their chosen leader, whom they destined to succeed Nero, was C. Calpurnius Piso, a handsome, wealthy and popular noble, and a boon companion of Nero. The plan to murder Nero was betrayed by a freedman Milichus. Piso, Faenius Rufus, Lucan and Seneca himself were executed.

In the next few months many more fell victims to his fear and resentment. Conspicuous among them was Paetus Thrasea, whose unbending virtue had long made him distasteful to Nero, and who was now suspected, possibly with reason, of sympathy with the conspirators. Poppaea died in the autumn of 65, and the general gloom was increased by a pestilence which followed the fire. Early in the summer of 66 the Parthian prince Tiridates came to Italy to receive the crown of Armenia at Nero's hands. It represented the final triumph of the arms and policy of Corbulo in the East, and at least a temporary solution of the Parthian problem.

Greece.—Towards the end of 66 Nero visited Greece with a retinue of soldiers, courtiers, musicians and dancers. The spectacle presented by Nero's visit was unique. He went professedly as an enthusiastic worshipper of Greek art and a humble candidate for the suffrages of Greek judges. At each of the great festivals, which to please him were for once crowded into a single year, he entered in regular form for the various competitions, scrupulously conformed to the tradition and rules of the arena, and awaited in nervous suspense the verdict of the umpires. The dexterous Greeks humoured him to the top of his bent. He planned and commenced the cutting of a canal through the Isthmus of Corinth.

Meanwhile the general dissatisfaction was coming to a head, as we may infer from the urgency with which the imperial freedman Helius insisted upon Nero's return to Italy. Revolt started in Gaul with the insurrection of Julius Vindex, governor of Gallia Lugdunensis. It is probable that the aims of Vindex included the liberation of northern Gaul, which would explain both the enthusiasm of the Gallic chiefs, and the opposition of the legions of the Rhine. This force defeated Vindex at Vesontio (Besançon) and offered the throne to their own commander Virginius Rufus, who refused it. Meanwhile the governors of Hispania, Tarraconensis and Galba and Otho, had rebelled, and Galba had claimed the throne. Nero returned from Greece to Naples for further revels.

Suicide.—The revolts in Spain and Germany terrified him too late into something like energy. The senate almost openly intrigued against him, and the populace were silent or hostile. The fidelity of the praetorian sentinels even was more than doubtful. When finally the palace guards forsook their posts, Nero despairingly stole out of Rome to seek shelter in a freedman's villa some four miles off. There he heard of the senate's proclamation of Galba as emperor, and of the sentence of death passed on himself. On the approach of the horsemen sent to drag him to execution, he collected sufficient courage to save himself by suicide. Nero died on June 9, 68, in the 31st year of his age and the fourteenth of his reign, and his remains were deposited by the faithful Acte in the family tomb of the Domitii on the Pincian hill. With his death ended the line of the Caesars, and Roman imperialism entered a new phase. His statues were broken, his name everywhere erased, and his "golden house" demolished.

The Roman populace for a long time reverenced his memory as that of an open-handed patron, and in Greece the recollections of his magnificence, and his enthusiasm for art, were still fresh when the traveller Pausanias visited the country a century later. The belief that he had not really died, but would return again to confound his foes, was long prevalent, not only in the remoter provinces, but even in Rome itself; and more than one pretender was able to collect a following by assuming the name of the last of the race of Augustus. More lasting still was the implacable hatred of those who had suffered from his cruelties. Roman literature, faithfully reflecting the sentiments of the aristocratic salons of the capital, while it almost canonized those who had been his victims, fully avenged their wrongs by painting Nero as a monster of wickedness. In Christian tradition he even appears as the mystic Antichrist, who was destined to come once again to trouble the saints. Even in the middle ages, Nero was still the very incarnation of splendid iniquity, while the belief lingered that he had only disappeared for a time, and as late as the 11th century his restless spirit was supposed to haunt the slopes of the Pincian hill.

The chief ancient authorities for Nero's life and reign are Tacitus (*Annals*, xiii.–xvi., edit. Furneaux), Suetonius, Dio Cassius (*Epit.* lxi., lxii., lxiii.) and Zonaras (*Ann.* xi.). The most important modern work is that of B. W. Henderson, *The Life and Principate of the Emperor Nero* (1903; *see* an important notice in *Class. Rev.* vol. xviii. p. 57), which contains full bibliography of ancient and modern writers: *see* also H. Schiller's *Nero*, and *Geschichte d. Kaiserzeit;* Lehmann, *Claudius und Nero;* Desider Kostolanyi, *Nero* (1928).

NERVA, MARCUS COCCEIUS (A.D. ?35–98), Roman emperor from Sept. 18, 96 to Jan. 25, 98, was born at Narnia in Umbria on Nov. 8, probably in the year 35. He came of a senatorial family, his father and grandfather having been jurists.

He was praetor (66) and twice consul, in 71 with the emperor Vespasian for colleague and again in 90 with Domitian. Towards the close of the latter's reign (93) he is said to have been banished to Tarentum on a charge of conspiracy. On the murder of Domitian in September 96 Nerva was declared emperor by the people and the soldiers. He is described as a quiet, kindly, dignified man, honest of purpose, but unfitted by his advanced age to bear the weight of empire. Nevertheless, his selection, in spite of occasional exhibitions of weakness, justified the choice. The new emperor recalled those who had been exiled by Domitian; what remained of their confiscated property was restored to them, and a stop was put to the vexatious prosecutions which Domitian had encouraged. But the popular feeling demanded more than this. The reaction against the informers became as dangerous as the previous system. It was checked by Nerva, who was actuated by the taunt of Titus Catius Caesius Fronto that, "bad as it was to have an emperor who allowed no one to do anything, it was worse to have one who allowed everyone to do everything."

Nerva seems to have followed the custom of announcing the general lines of his future policy. He showed himself anxious to respect the traditional privileges of the senate, and such maxims of constitutional government as still survived. He pledged himself to put no senator to death. His councillors in all affairs of state were senators, and the hearing of claims against the *fiscus* was entrusted to a praetor and a court of *iudices*.

The economical condition of Italy evidently excited his alarm and sympathy. The last mention of a *lex agraria* in Roman history is connected with his name. Under the provisions of this *lex*, large tracts of land were bought up and allotted to poor citizens. The cost was defrayed partly from the imperial treasury, but partly also from Nerva's private resources, and the execution of the scheme was entrusted to commissioners. He also founded or restored colonies at Verulae, Scyllacium and Sitifis in Mauretania. An entirely new departure was the main-

tenance at the public cost of the children of poor parents in the towns of Italy, which was combined ingeniously with the provision of loans for farmers. The treasury found the money, which was lent on the security of farms, and the farmers paid the interest to their municipality for the maintenance of poor children.

Private individuals were also encouraged to follow the imperial example. In the hands of Trajan, Hadrian and the Antonines, Nerva's example bore fruit in the institution of the *alimentationes,* the most genuinely charitable institution of the pagan world. These measures Nerva supplemented by others which aimed at lightening the financial burdens on the declining industry of Italy. The cost of maintaining the imperial postal system (*vehiculatio*) was transferred to the *fiscus;* from the same source apparently money was found for repairing the public roads and aqueducts; and lastly, the lucrative but unpopular tax of 5% on all legacies or inheritances (*vicesima hereditatum*), was so readjusted as to remove the grosser abuses connected with it. At the same time Nerva did his best to reduce the overgrown expenditure of the state. A commission was appointed to consider the best modes of retrenchment, and the outlay on shows and games was cut down to the lowest possible point. Early, apparently, in 97 he detected a conspiracy against his life headed by L. (or C.) Calpurnius Crassus, but he contented himself with a hint to the conspirators that their designs were known, and with banishing Crassus to Tarentum. The praetorian guards, at the instigation of one of their two prefects. Casperius Aelianus, whom Nerva had retained in office, imperiously demanded the execution of Domitian's murderers, the chamberlain Parthenius and Petronius Secundus, Aelianus's colleague. Nerva vainly strove to save, even at the risk of his own life, the men who had raised him to power, but the soldiers brutally murdered the unfortunate men, and forced him to propose a vote of thanks for the deed. This humiliation convinced Nerva of the necessity of placing the government in stronger hands than his own. He resolved to adopt as his colleague and destined successor, M. Ulpius Trajanus, a distinguished soldier, at the time in command of the legions on the Rhine. In Oct. 97, in the temple of Jupiter on the Capitol, Trajan was formally adopted as his son and declared his colleague in the government of the empire. For three months Nerva ruled jointly with Trajan, but on Jan. 25, 98, he died somewhat suddenly. He was buried in the sepulchre of Augustus, and divine honours were paid him by his successor. The verdict of history upon his reign is best expressed in his own words—"I have done nothing which should prevent me from laying down my power, and living in safety as a private man." The memory of Nerva is still preserved by the ruined temple in the Via Alessandrina (il Colonacce) which marks the site of the Forum begun by Domitian, but which Nerva completed and dedicated.

NERVAL, GÉRARD DE (1808–1855), the adopted name of Gérard Labrunie, French man of letters, born in Paris on May 22, 1808. His father was an army doctor, and the child was left with an uncle in the country, while Mme. Labrunie accompanied her husband in his campaigns. She died in Silesia. In 1811 his father returned, and beside Greek and Latin taught the boy modern languages and the elements of Arabic and Persian. Gérard found his favourite reading in old books on mysticism and the occult sciences. His first work, *La France guerrière, élégies nationales,* was published while he was still a schoolboy at the Collège Charlemagne. In 1828 he published a translation of Goethe's *Faust,* the choruses of which were afterwards used by Berlioz for his legend-symphony, *The Damnation of Faust.* A number of poetical pieces and three comedies combined to acquire for him, at the age of 21, a considerable reputation, and led to his association with Théophile Gautier in the preparation of the dramatic *feuilleton* for the *Presse.* He conceived a violent passion for the actress Jennie Colon, in whom he thought he recognized a certain Adrienne, who had fired his childish imagination. Her marriage and her death in 1842 were blows from which his nervous temperament never really recovered. He travelled in Germany with Alexandre Dumas, and alone in various parts of Europe, leading a very irregular and eccentric life. In 1843 he visited Constantinople and Syria, where, among other adventures, he nearly married the daughter of a Druse sheikh. He contributed accounts of his travels to the *Revue des Deux Mondes* and other periodicals. After his return to Paris in 1844 he resumed for a short time his *feuilleton* for the *Presse,* but his eccentricities increased and he committed suicide by hanging, on Jan. 25, 1855. The literary style of Gérard is simple and unaffected, and he has a peculiar faculty of giving to his imaginative creations an air of naturalness and reality. In a series of novelettes, afterwards published under the name of *Les Illuminés, ou les précurseurs du socialisme* (1852), containing studies on Rétif de la Bretonne, Cagliostro and others, he gave a sort of analysis of the feelings which followed his third attack of insanity. Among his other works the principal are *Les Filles du feu* (1854), which contains his masterpiece, the semi-autobiographical romance of *Sylvia; Scènes de la vie orientale* (1848–50); *Contes et facéties* (1852); *La Bohême galante* (1856); and *L'Alchimiste,* a drama in five acts, the joint composition of Gérard and Alexandre Dumas. His *Poésies complètes* were published in 1877.

See the notices by Théophile Gautier and Arsène Houssaye, prefixed to the posthumous *Le Rêve et la vie* (1855); Maurice Tourneux's sketch in his *Âge du romantisme* (1887); and a sympathetic study of temperament in the *Névrosés* (1898) of Mme. Arvède Barine. *See* also G. Ferrières, *Gérard de Nerval* (1906).

NERVE, originally a sinew or tendon (*cf.* "strain every nerve") but now used for the conducting fibres of the nervous system in anatomy and secondarily as a psychical term for courage or firmness and in "nervousness" for the opposite quality. Here the anatomy of the nerves is dealt with; *see* also NERVOUS SYSTEM; MUSCULAR SYSTEM, ANATOMY OF; NEUROPATHOLOGY; etc.

CRANIAL

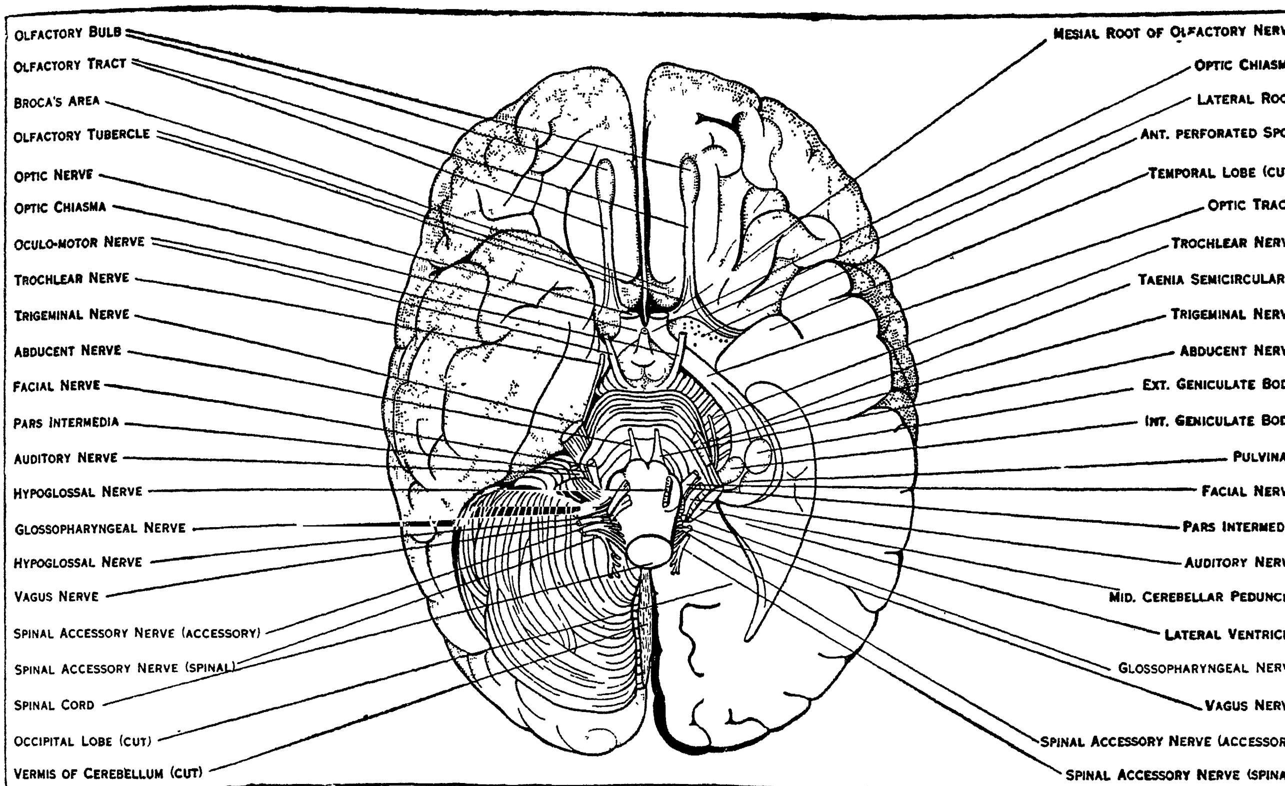
The 12 pairs of cranial nerves rise directly from the brain. With one exception they all contain medullated fibres (*see* NERVOUS SYSTEM). The following is a list:—

(1) Olfactory; (2) Optic; (3) Oculomotor or Motor oculi; (4) Trochlearis or Patheticus; (5) Trigeminal or Trifacial; (6) Abducens; (7) Facial; (8) Auditory; (9) Glossopharyngeal; (10) Vagus or Pneumogastric; (11) Spinal accessory; (12) Hypoglossal.

Olfactory.—The first, or olfactory nerve, consists of the *olfactory bulb* and *tract,* which are a modified lobe of the brain and lie beneath the sulcus rectus on the frontal lobe of the brain (fig. 1). At its posterior end the tract becomes continuous with the brain; anteriorly is the bulb from which some twenty small non-medullated nerves pass through the cribriform plate of the ethmoid to supply the sensory organs in the olfactory mucous membrane (*see* OLFACTORY SYSTEM).

Optic.—The second or optic nerve consists of the *optic tract,* the *optic commissure* or *chiasma,* and the *optic nerve* proper. The optic tract begins at the lower visual centres or internal and external geniculate bodies, the superior quadrigeminal body and the pulvinar (fig. 1), but these again are connected with the higher visual centre in the occipital lobe by the optic radiations (fig. 2). In the chiasma some of the fibres cross and some do not, so that the right optic tract forms the right half of both the right and left optic nerves. The fibres from the internal geniculate body of one side cross in the chiasma to the same body of the opposite side, forming *Gudden's commissure.* The optic nerve passes through the optic foramen into the orbit, where it is penetrated by the central artery of the retina, and pierces the sclerotic internal to the posterior pole of the eyeball. *See* also EYE, HUMAN.

Oculomotor.—The third or oculomotor nerve rises from a nucleus in the floor of the aqueduct of Sylvius and comes to the surface on the inner side of the crus cerebri (fig. 1), pierces the dura mater, and lies in the outer wall of the cavernous sinus,



FROM D. J. CUNNINGHAM, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 1.—VIEW OF INFERIOR SURFACE OF BRAIN. WITH LOWER PORTION OF THE TEMPORAL AND OCCIPITAL LOBES; THE CEREBELLUM ON THE LEFT SIDE IS REMOVED TO SHOW ORIGINS OF THE CEREBRAL NERVES

where it divides into an upper and lower branch. Both these enter the orbit through the sphenoidal fissure, the upper branch supplying the superior rectus and levator palpebrae superioris muscles, the lower the inferior and internal rectus and the inferior oblique, thus supplying five of the seven orbital muscles.

Trochlear.—The fourth or trochlear nerve is very small, and comes from a nucleus a little lower than that of the third nerve. It crosses to the opposite side in the fourth ventricle, winds round the outer side of the crus cerebri (fig. 1) and enters the outer wall of the cavernous sinus to reach the orbit through the sphenoidal fissure. Here it enters the superior oblique muscle on its orbital surface.

Trigeminal.—The fifth or trigeminal nerve consists of motor and sensory roots. The motor root rises from a nucleus in the upper lateral part of the floor of the fourth ventricle, and by a descending (mesencephalic) tract near the Sylvian aqueduct (fig. 3). The large sensory root goes to a sensory nucleus a little external to the motor one, and also, by a spinal or descending root, to the substantia gelatinosa Rolandi as low as the second spinal nerve (fig. 3). The superficial origin of the fifth nerve is from the side of the pons (fig. 1), and the two roots at once pass into a small compartment of the dura mater, where the large crescentic *Gasserian ganglion* is formed upon the sensory root, and from this the three branches, ophthalmic, maxillary, mandibular, come off. The motor root only joins the mandibular branch. The *ophthalmic division* runs in the outer wall of the cavernous sinus, where it divides into frontal, lachrymal and nasal branches. They all enter the orbit through the sphenoidal fissure. The *maxillary division* leaves the skull through the foramen rotundum, and then runs across the roof of the spheno-maxillary fossa; here the *spheno-maxillary* or *Meckel's ganglion* hangs from it by two roots. The nerve then runs in the floor of the orbit, giving off *superior dental* branches, until it emerges on to the face at the infraorbital foramen, where it divides into *palpebral, nasal* and *labial branches.* The *mandibular division* leaves the skull through the foramen ovale, and at once gives off motor branches for the muscles of mastication; these are derived from the motor root of the fifth, except that for the buccinator, which really supplies only the skin and mucous membrane in contact with the muscle. After the motor branch is given off, the nerve divides into *lingual, inferior dental* and *auriculo-temporal.* The lingual is joined by the *chorda tympani* branch of the facial nerve.

Abducent.—The sixth or abducent nerve rises from a nucleus in the floor of the fourth ventricle deep to the eminentia teres (fig. 3). It appears on the surface of the brain just below the pons and close to the middle line (fig. 1), pierces the dura mater and runs in the floor of the cavernous sinus to the sphenoidal fissure. Entering the orbit it supplies the external rectus muscle.

Facial.—The seventh or facial nerve begins in a nucleus which is about the same level as that for the sixth, but much deeper from the floor of the fourth ventricle as well as farther from the middle line (fig. 3). The fibres of the facial loop round the nucleus of the sixth, and then emerge in the triangular interval between the medulla, pons and cerebellum, close to the eighth nerve (fig. 1). Entering the internal auditory meatus the facial nerve passes into a canal in the petrous bone (*aqueductus Fallopii*), emerges at the stylo-mastoid foramen on the base of the skull, and enters the parotid gland, in which it forms a plexus called the *pes anserinus.* From this, branches pass to all the muscles of the face except those of mastication.

Auditory.—The eighth or auditory nerve is in two bundles, *cochlear* and *vestibular.* The former comes from the cochlear nuclei which lie deep to the acoustic tubercle in the floor of the fourth ventricle (fig. 3); the latter rises from the dorsal nucleus, nucleus of Deiters and the nucleus of the descending root, which are more deeply placed. The *nucleus of Deiters* is connected with the cerebellum, and is concerned in maintaining the equilibrium (*q.v.*) of the body; the cochlear nuclei are connected with the inferior quadrigeminal body by the lateral fillet as well as with the internal geniculate body, and thus with the higher auditory centre in the temporo-sphenoidal lobe by the auditory radiations. The vestibular root passes in front of the restiform body (fig. 3), and the cochlear behind that body. Together they enter the internal auditory meatus, pierce the lamina cribrosa, the vestibular nerve supplying the utricle and superior and external semicircular canals, the cochlear nerve, the posterior canal, the saccule

and the cochlea (*see* Ear, Anatomy of).

Glossopharyngeal.—The ninth or glossopharyngeal nerve is chiefly, if not entirely, sensory, and its deep termination in the brain is the solitary bundle (fig. 3). It appears on the surface between the olive and restiform body (fig. 1), leaves the skull through the posterior lacerated foramen, runs downward and forward, between the internal and external carotid arteries, and

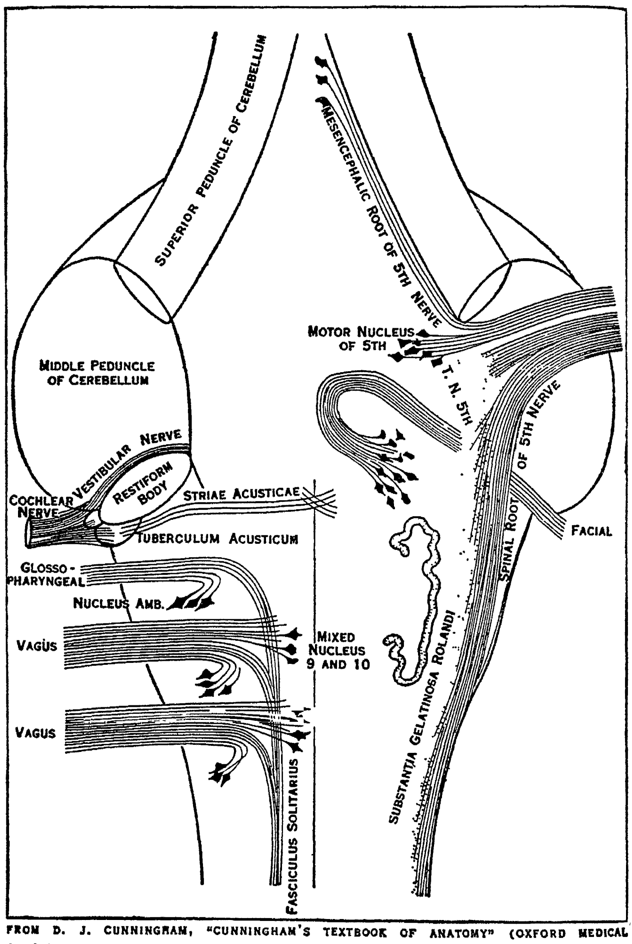
FIG. 2.—DIAGRAM OF THE CENTRAL CONNECTIONS OF THE OPTIC NERVE AND OPTIC TRACT

eventually reaches the back of the tongue (*see* Tongue).

Vagus.—The tenth nerve or vagus has sensory and motor fibres; the former go to the solitary bundle mentioned in the description of the last nerve (fig. 3), while the latter come from the dorsal nucleus and nucleus ambiguus, both of which are found deep to the lower half of the fourth ventricle. The nerve appears on the surface between the olive and restiform body and just below the ninth (fig. 1). It leaves the skull through the posterior lacerated foramen, gives off *auricular* and *pharyngeal branches* and the *superior laryngeal branch* which is the sensory nerve of the larynx (fig. 4). The accessory part of the eleventh nerve joins the tenth, and from this communication motor twigs to the pharynx, larynx, alimentary and respiratory tracts are derived, as well as inhibitory fibres of the heart. In the neck the vagus accompanies the carotid artery and internal jugular vein, and gives off cardiac branches. It enters the thorax between the subclavian artery and vein. On the right side its recurrent laryngeal branch loops under the subclavian artery (fig. 4), and runs up to supply all the muscles of the larynx except one (*see* Respiratory System, Anatomy of). In the thorax the left vagus passes in front of the arch of the aorta, under which the left recurrent laryngeal loops, and on both sides a thoracic cardiac branch is given to the deep cardiac plexus. Both vagi pass behind the root of their own lung, and break up to form the *pulmonary plexus;* they then reach the oesophagus, where they again break up into an *oesophageal plexus.* As the diaphragm is approached the two nerves become distinct again, but the left one now lies in front and the right behind the food tube, so that, when the stomach is reached, the left vagus supplies the front of the organ and communicates with the *hepatic plexus,* while the right goes to the back and communicates with the *coeliac, splenic* and *renal plexuses.*

Spinal Accessory.—The eleventh or spinal accessory nerve is entirely motor, and consists of a *spinal* and an *accessory* part. The former rises from the anterior horn of the grey matter of the spinal cord as low as the fifth cervical nerve. Its fibres come to the surface mid-way between the anterior and posterior nerve-roots, and run up through the foramen magnum to join the accessory part, the deep origin of which is the lower part of the nucleus ambiguus. The accessory part joins the vagus, while the spinal part pierces the sterno-mastoid muscle and runs downward and backward across the posterior triangle of the neck to enter the trapezius; both these muscles are in part supplied by the nerve.

Hypoglossal.—The twelfth or hypoglossal nerve is motor, and rises from a nucleus in the floor of the fourth ventricle. It emerges from the brain between the anterior pyramid and the olive (fig. 1), and leaves the skull in two bundles through the



FROM D. J. CUNNINGHAM, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

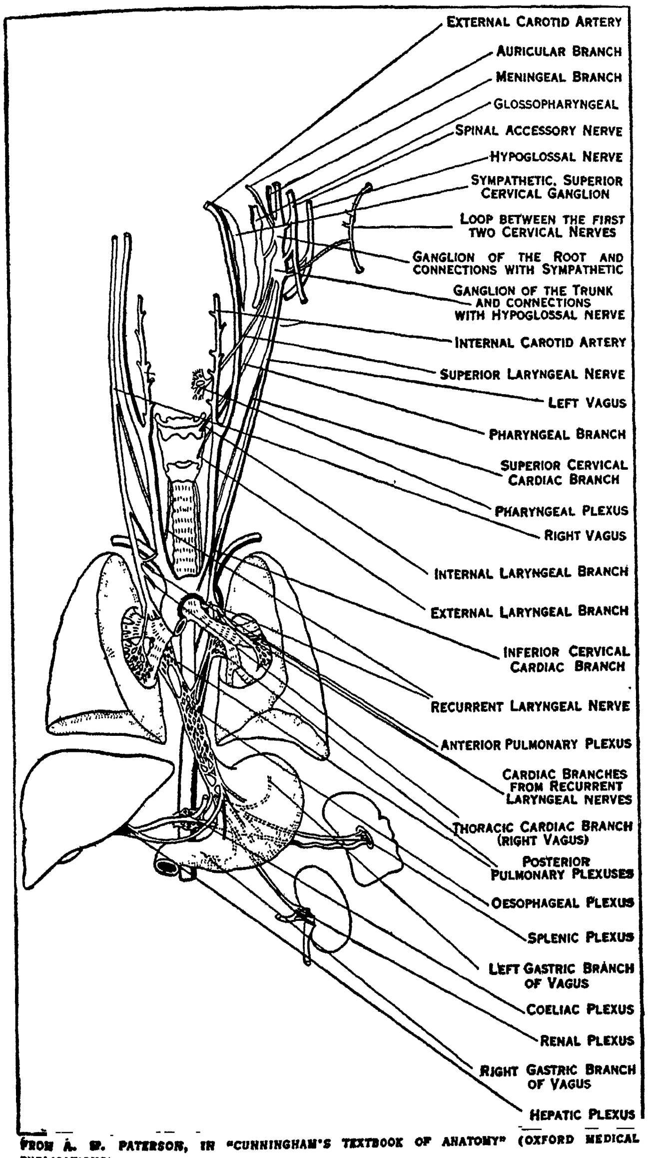
FIG. 3.—DEEP ORIGINS OF CRANIAL NERVES FROM THE FLOOR OF THE FOURTH VENTRICLE

anterior condylar foramen. Soon after it is closely bound to the vagus, and receives contributions from the loops between the first and second and the second and third cervical nerves. The nerve then passes downward and runs forward on the surface of the hyo-glossus to the muscles of the tongue. It gives off branches to many of the depressor muscles of the hyoid bone and larynx. All the true muscles of the tongue are supplied by the medullary part of the nerve.

For the embryology and comparative anatomy of the cranial nerves, *see* Nervous System.

SPINAL

The spinal nerves arise from each side of the spinal cord and are distributed to the trunk and limbs, though some of the upper ones supply the lower parts of the head and face. There are generally thirty-one pairs, eight cervical (abbreviated C.), twelve thoracic (Th.)—formerly called dorsal,—five lumbar (L.), five sacral (S.) and one coccygeal (Coc.). As the thoracic nerves are the simplest and most generalized in their arrangement, a typical one of these, say the fourth or fifth, will be first described.



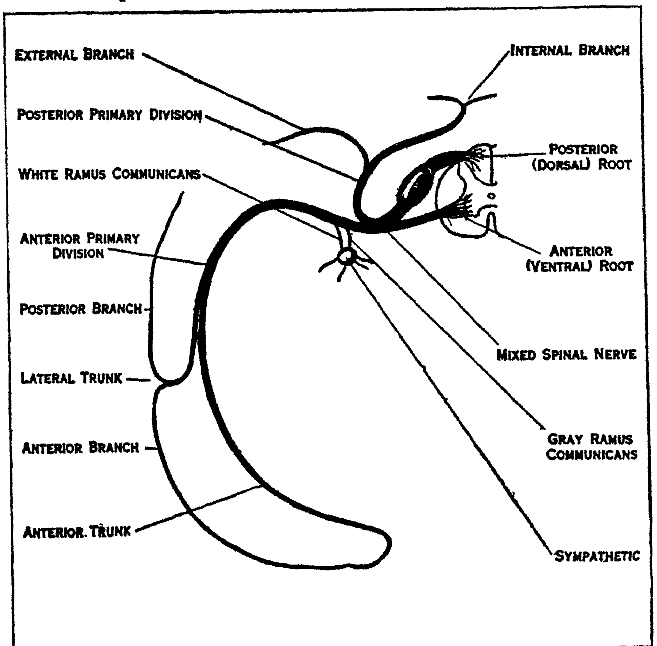
FROM A. M. PATERSON, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 4.—THE DISTRIBUTION OF THE 10TH (PNEUMOGASTRIC OR VAGUS) NERVE

The nerve is attached to the spinal cord by two roots, of which the ventral is purely efferent or motor and the dorsal purely afferent or sensory. On the dorsal root is a fusiform ganglion which lies in the foramen between the vertebrae through which the nerve passes. The two roots then join together to form a mixed nerve (fig. 5), but very soon divide once more into anterior (ventral) and posterior (dorsal) primary divisions. These, however, each contain sensory and motor fibres. Just before it divides in this way the mixed nerve gives and receives its rami communicantes with the sympathetic (*see* NERVOUS SYSTEM).

The anterior primary division runs round the trunk, between the ribs, forming an intercostal nerve and giving off a lateral cutaneous branch, when the side of the body is reached, which divides into anterior and posterior secondary branches. The rest of the division runs forward, supplying the intercostal muscles, as far as the edge of the sternum, when it ends in an anterior cutaneous branch to the front of the chest. The dorsal primary division divides into an external (lateral) and internal (mesial) branch through which the skin and muscles of the back are supplied.

It will be seen from the foregoing that the thoracic nerves are almost completely segmental in their distribution, in other words, each supplies a slice of the body, but in the other regions this segmental character is masked by the development of the branchial skeleton and the limbs. In the cervical region the first cervical or *suboccipital nerve* comes out between the occiput and atlas and does not always have a posterior root. When it has not, it obviously can supply no skin. Its anterior primary division joins those of the second, third and fourth cervical nerves to form the *cervical plexus,* from which the skin of the side of the neck and lower part of the head and face are supplied by means of the *small occipital, great auricular, superficial cervical, suprasternal, supraclavicular* and *supraacromial* nerves (fig. 7), as well as those muscles of the neck which are not supplied by the cranial nerves. The *phrenic nerve,* which comes chiefly from the fourth cervical, runs down, through the thorax, to supply the greater part of the diaphragm. The explanation of this long course (*see* DIAPHRAGM) is that the diaphragm is formed in the neck region of the embryo. The posterior primary division of the second cervical nerve is large, and its inner (mesial) branch (*great occipital*) supplies most of the back of the scalp (fig. 7). The fifth, sixth, seventh and eighth anterior primary divisions of the cervical nerves as well as a large part of that of the first thoracic are prolonged into the arm, and in the lower part of the neck and armpit communicate with one another to form the *brachial plexus.* It will be seen from fig. 8 that each component nerve except the first thoracic divides into an anterior (ventral) and a posterior (dorsal) division which are best spoken of as secondary divisions in order to prevent confusion with the anterior and posterior primary divisions which all the spinal nerves undergo. In the diagram the anterior secondary divisions are white, while the posterior are shaded. Later on in the plexus three cords are formed of which the posterior is altogether made up of the posterior secondary divisions, while the anterior secondary divisions of the fifth, sixth and seventh cervical nerves form the external cord, and those of the eighth cervical and first thoracic the inner. As a general rule the nerves which rise from the ventral secondary divisions of the limb plexuses run only to that surface of the limb which was ventral in the embryo, while the

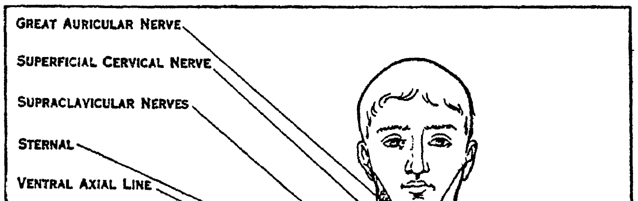


FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 5.—SCHEME OF THE DISTRIBUTION OF A TYPICAL SPINAL NERVE

dorsal secondary divisions are confined to the original dorsal area, but, in order to apply this to the human adult, it must be realized that the limbs are at one time flattened buds coming off at right angles from the side of the body and having dorsal and ventral surfaces, one (preaxial) border toward the head of the embryo, and one (postaxial) toward the tail.

Brachial Plexus.—With regard to the muscular supply of a limb the general rule is that each muscle is supplied by fibres



FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 6.—DISTRIBUTION OF THE CUTANEOUS NERVES ON THE FRONT OF THE TRUNK, SHOWING, ON THE LEFT SIDE OF THE FIGURE, THE DISTRIBUTION OF THE SEVERAL NERVES

derived from more than one spinal nerve; this is made possible by the redistribution of fibres in the plexuses. Moreover, the muscular supply does not necessarily correspond to that of the overlying skin, because (*see* MUSCULAR SYSTEM, ANATOMY OF) some of the primitive muscles have been suppressed, others have fused together, while others have shifted their position to a considerable distance. Bearing the foregoing facts in mind, the main distribution of the nerves of the brachial plexus may be surveyed. The outer cord of the plexus gives off the *external anterior thoracic nerve* (C. 5, 6, 7) to the pectoralis major, the *musculo-cutaneous* nerve (C. 5, 6) to the muscles on the front of the arm, and to the skin of the outer side of the forearm and the outer head of the *median nerve* (C. 5, 6, 7), which joins the inner head (C. 8, Th. 1) and supplies most of the flexor muscles of the front of the forearm as well as those of the ball of the thumb.

From the inner cord come the inner head of the median just mentioned, the *ulnar nerve* (C. 8, Th. 1), which passes down behind the internal condyle of the humerus, where it is popularly known as the "funny bone" and supplies the flexor carpi ulnaris, half the flexor profundus digitorum, and most of the muscles of the hand as well as the inner digit and a half on the palmar and dorsal aspects. Other branches of the inner cord are the *internal cutaneous* (C. 8, Th. 1) supplying the inner side of the forearm, the *lesser internal cutaneous* (Th. 1) which often joins the *intercosto-humeral* or lateral cutaneous branch of the second intercostal nerve to supply the skin on the inner side of the upper arm, and the *internal anterior thoracic nerve* (C. 8, Th. 1) to the pectoralis minor and major.

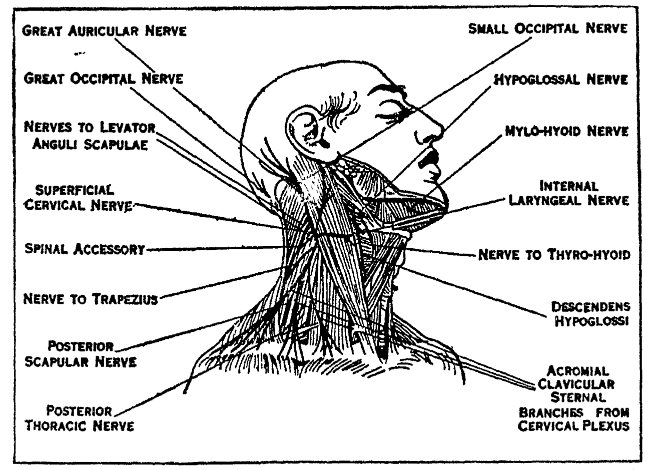
From the posterior cord are derived the three *subscapular nerves* (C. 5, 6, 7, 8) which supply the subscapularis, teres major and latissimus dorsi muscles, the *circumflex nerve* (C. 5, 6) supplying the deltoid and teres minor muscles, and the skin over the lower part of the deltoid, and the *musculo-spiral nerve* (C. 5, 6, 7, 8) which is the largest branch of the brachial plexus and gives off cutaneous twigs to the outer side and back of the arm and to the back of the forearm, as well as muscular twigs to the triceps and adjacent muscles. At the elbow this nerve divides into the *radial* and *posterior* interosseous. The radial is entirely sensory and supplies the skin of the outer side of the back of the hand, including three digits and a half, while the posterior interosseous is wholly muscular, supplying the muscles on the back of the forearm. It will be seen that the posterior cord is derived altogether from posterior secondary divisions of the plexus, but there are three other nerves derived from these which should be mentioned.

The *posterior thoracic* or respiratory nerve of Bell comes off the back of the fifth, sixth and seventh cervical nerves before the anterior and posterior secondary divisions separate, and runs down to supply the serratus magnus muscle.

The *posterior scapular* or nerve to the rhomboid muscles runs to those muscles from the fifth cervical.

The *suprascapular nerve* (C. 5, 6) passes through the suprascapular notch to supply the supraspinatus and infraspinatus muscles.

Lumbo-Sacral Plexus.—The spinal nerves which are distributed to the lower limbs first intercommunicate in the lumbar and sacral plexuses, which, with the perineal nerves, are sometimes spoken of together as the lumbo-sacral plexus. The *lumbar plexus* (fig. 9) is formed as a rule of the first four lumbar nerves, though the greater part of the first lumbar is segmental in its distribution and resembles one of the thoracic nerves. It early divides into an *ilio-hypogastric* and *ilio-inguinal* branch, which run round the abdominal wall in the substance of the muscles, and of which the former gives off an iliac branch, which is in

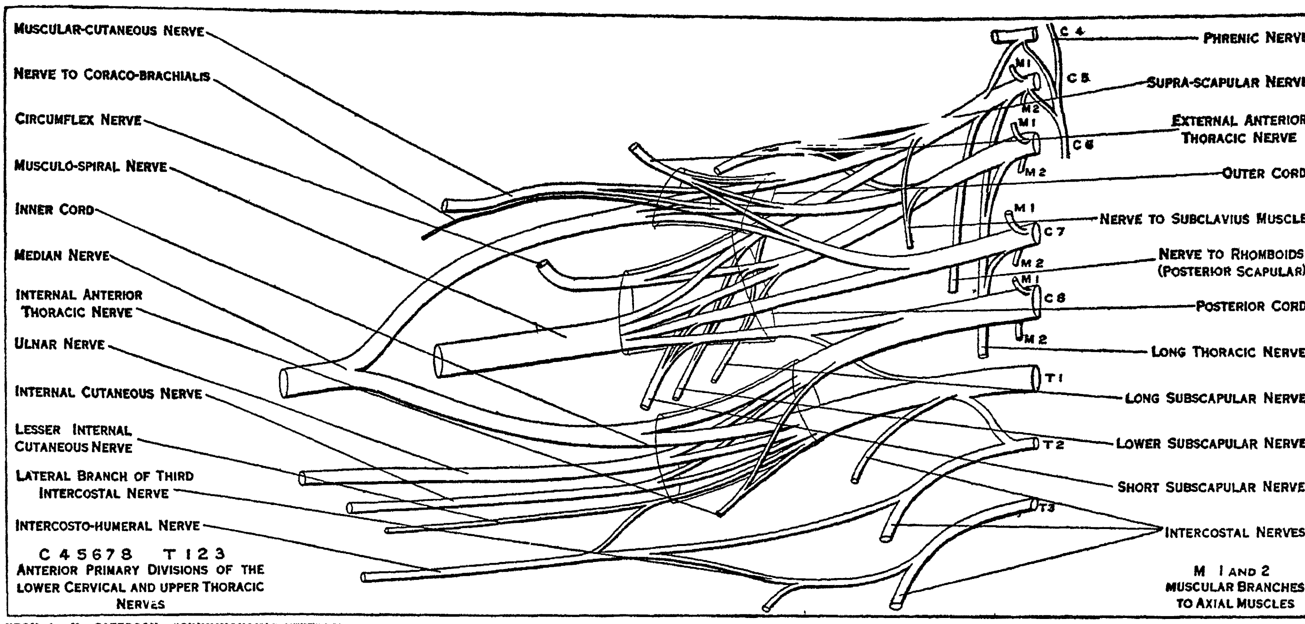


FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 7.—THE TRIANGLES OF THE NECK, SHOWING THE NERVES

series with the lateral cutaneous branches of the intercostal nerves and passes over the crest of the ilium to the gluteal region, while the hypogastric branch runs round to the skin of the pubic region.

The other anterior secondary division of the lumbar plexus is the obturator (fig. 9). The *obturator nerve* (L. 2, 3, 4) supplies the adductor group of muscles on the inner side of the thigh as well as the hip and knee joints; it occasionally has a cutaneous branch on the inner side of the thigh. The posterior secondary branches of the plexus are the genito-crural, the external cutaneous and the anterior crural. The genito-crural nerve (L. 1, 2)



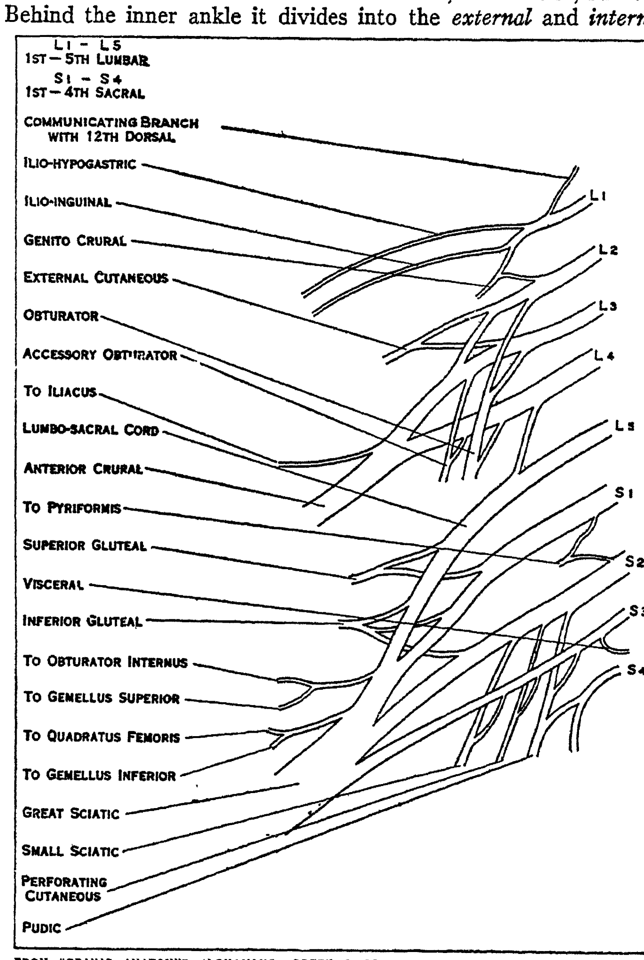
FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 8.—THE NERVES OF THE BRACHIAL PLEXUS

is partly anterior (ventral) and partly posterior (dorsal). It sends one anterior branch through the inguinal canal to supply the cremaster muscle, and another (posterior) to the skin of the thigh just below the groin.

The *external cutaneous nerve* (L.2, 3) supplies the skin of the outer side of the thigh, while the *anterior crural* (L.2, 3, 4) innervates the muscles on the front of the thigh, the skin on the front and inner side of the thigh, through its *middle* and *internal cutaneous* branches, and the skin of the inner side of the leg and foot through the *internal saphenous* branch. At first sight it is difficult to understand how the anterior crural nerve, which supplies the skin of the front of the thigh, is a posterior secondary division of the lumbar plexus, but the explanation is that the front of the human thigh was originally the dorsal surface of the limb bud, and the distribution of the nerve is quite easily understood if the position of the hind limb of a lizard or crocodile is glanced at. The fourth lumbar nerve is sometimes called the *nervus furcalis,* because, dividing, it partly goes to the lumbar, and partly to the sacral plexus (fig. 9), though, when the plexus is prefixed, the third lumbar may be the nervus furcalis, or, when it is postfixed, the fifth lumbar.

All the constituent nerves of the plexus run into one huge nerve, the *great sciatic,* which runs down the back of the thigh and, before reaching the knee, divides into *external* and *internal popliteal nerves.* These two nerves are sometimes separate from their first formation in the plexus, and may always be separated easily by the handle of a scalpel, since they are only bound together by loose connective tissue to form the great sciatic nerve. When they are separated in this way the external popliteal is made up entirely of posterior (dorsal) secondary divisions (fig. 9), and is derived from the fourth and fifth lumbar and first and second sacral nerves, while the internal popliteal is formed by the anterior (ventral) secondary divisions of the fourth and fifth lumbar and first, second and third sacral nerves. The *external popliteal nerve* supplies the short head of the biceps femoris (*see* MUSCULAR SYSTEM, ANATOMY OF), and, just below the knee, divides into anterior tibial and musculo-cutaneous branches, which supply the dorsal surface of the leg and foot. The *anterior tibial nerve* is chiefly muscular, innervating the muscles in front of the tibia and fibula as well as the extensor brevis digitorum pedis on the dorsum of the foot, though it gives one small cutaneous branch to the cleft between the first and second toes. The *musculo-cutaneous nerve* supplies the peroneus longus and brevis muscles, and the rest of the skin of the dorsum of the foot and lower part of the leg, while the skin of the upper part of the dorsum of the leg, below the knee, is supplied by the external popliteal before its division. The *internal popliteal nerve,* after supplying the hamstrings, is continued into the calf of the leg as the *posterior tibial* and innervates all the muscles on this, the ventral, surface. Behind the inner ankle it divides into the *external* and *internal*



FROM "GRAY'S ANATOMY" (LONGMANS, GREEN & CO.)

FIG. 9.—PLAN OF THE LUMBAR AND SACRAL PLEXUSES

plantar nerves, from which the muscles and skin of the sole are supplied. A little above the knee each popliteal nerve gives off a contribution to help form the *external* or *short saphenous nerve.* These join about the middle of the back of the calf, and the, now

formed, *short saphenous nerve* runs down behind the outer ankle to supply the outer side of the foot. Sometimes it encroaches on the dorsum of the foot, replacing part of the musculo-cutaneous. To return to the sacral plexus: branches are given off from the anterior secondary divisions to the short external rotator muscles of the hip (pyriformis, quadratus femoris, etc.), while from the posterior secondary divisions come the superior gluteal (L. 5, S. 1) and the inferior gluteal (L. 5, S. 1, 2) to the muscles of the buttocks.

In modern descriptions the lower branches of the lumbo-sacral plexus are grouped into a *pudendal plexus,* and the plan, though open to criticism on morphological grounds, has such descriptive advantages that it is followed here. Contributions from the first, second, third and fourth sacral, and the coccygeal nerve, form it, and these contributions are almost all anterior (ventral) secondary divisions. The branches of this plexus are the small sciatic, pudic, visceral, perforating cutaneous, muscular and sacro-coccygeal nerves. The *small sciatic* (S.1, 2, 3) is partly dorsal and partly ventral in its origin and distribution; it supplies the skin of the perineum, buttock and the back of the thigh. The *pudic nerve* (S.2, 3, 4) helps to supply the skin and muscles of the perineum and genital organs. The *visceral branches* form the pelvic stream of white rami communicantes (*see* NERVOUS SYSTEM); they run from the second and third or third and fourth sacral nerves to the pelvic plexuses of the sympathetic system. The *perforating cutaneous nerve* (S.2, 3) pierces the great sacro-sciatic ligament and supplies the skin over the lower internal part of the buttock. The *muscular branches* (S.3, 4) supply the external sphincter, levator ani and coccygeus.

The *sacro-coccygeal nerve* (S.4, 5; Coc.1) runs down on each side of the coccyx to supply the adjacent skin, and represents the ventro-lateral nerve of the tail of lower mammals.

(F. G. P.; X.)

The function of the nerves is to transmit messages from the sense organs to the central nervous system and from the central nervous system to the muscles and gland cells. The incoming (or "afferent") messages are decoded, so to speak, in the spinal cord and brain and the outgoing ("efferent") messages are elaborated there, the nerves acting merely as the conducting mechanism between the periphery and the central controlling station. A nerve appears to the naked eye as a long cord of whitish, translucent

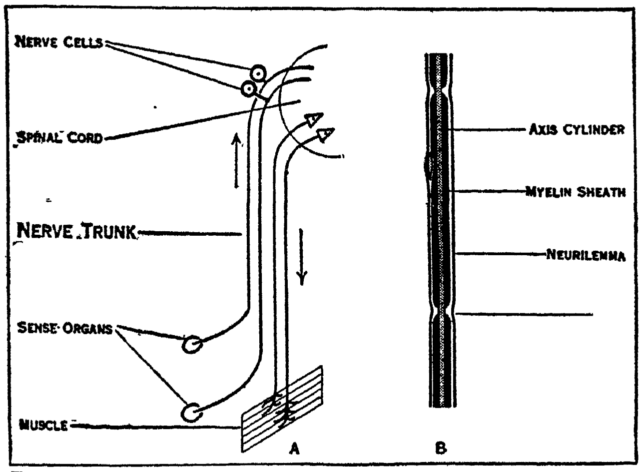


FIG. 10.—A PERIPHERAL NERVE AND ITS FIBRES. B. STRUCTURE OF NERVE FIBRE

material; the large nerve trunks like the sciatic (in man) may be half an inch in breadth, but the ultimate branches are so thin as to be scarcely visible. Microscopically the nerve is made up of a number of fibres, about $\frac{1}{100}$mm. in diameter, each of which acts as an independent conducting path: so that a nerve of medium size may contain several thousand fibres, some terminating in sense organs and some in muscles or glands.

The nerve fibre itself is made of a central core or "axis cylinder" of protoplasm arising from the body of a nerve cell which is generally stationed in or near the spinal cord: the axis cylinder runs from one end of the fibre to the other enclosed in a sheath of fatty material (myelin) interrupted by occasional constrictions or "nodes" and this in turn is enclosed in a membranous sheath called the neurilemma. Either or both sheaths may be absent in certain fibres. A diagram of the general structure of the nerve and its fibres is shown in fig. 10.

The impulse set up by an electric shock in an isolated nerve might have little connection with the normal working of the

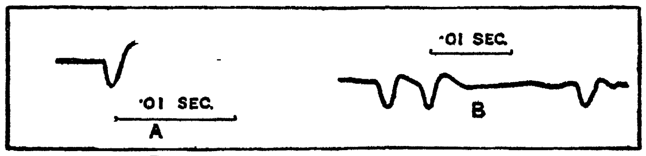

FIG. 11.—ELECTRIC RESPONSE OF NERVE
A. Record of "action current" in a frog's sciatic nerve, stimulated electrically. B. Action of currents in sensory nerve fibres, by light touch

nerve in the body, but there is now no doubt that the messages normally conveyed by the nerve fibres do consist of these impulses and of nothing else. To show this it is necessary to magnify the electric changes in the nerve trunk several thousand times by valve amplification; it is then possible to record the discharge of impulses travelling towards the central nervous system from the sense organs or away from it to the muscles. A portion of such a record is given in fig. 11. A sense organ has been stimulated by touching the skin and a series of impulses passes up the sensory fibres. Each impulse has the usual brief action current and all are of the same size whatever the strength of the stimulus. This does not prevent the nerve fibre from signalling the intensity of stimulation, for it is found that the frequency of the discharge (the number of impulses per second) depends on the stimulus, and the frequency may vary over a wide range (from 5 to 150 a second in the frog). The impulses from the different sense organs are not all exactly alike, for their rate of travel depends on the size of the fibre and the fibres from different organs are not all of the same diameter; but all impulses whether motor or sensory seem to be of the same type and up to the present we have no evidence of any kind of nervous conduction. (E. D. A.)

NERVI, a coast town of Liguria, Italy, province of Genoa, 7½ mi. S.E. of Genoa by rail (also electric tramway), 82 ft. above sea level. Pop. (1936), 4,002 (town), 8,769 (commune). It is a winter resort. It is surrounded with groves of olives, oranges and lemons, and its villas have beautiful gardens. At Quarto, 2½ mi. N.W., 1,000 Garibaldians embarked for Marsala in 1860.

NERVOUS SYSTEM. The nervous system forms an extremely complicated set of links between different parts of the body, and is divided into (A) the central nervous system, composed of (1) the brain, and (2) spinal cord; (B) the peripheral nervous system, consisting of (1) the cranial nerves, (2) the spinal nerves, (3) the various sense organs, such as the eye, ear, olfactory organ, taste organ and tactile organs, and (4) the motor end plates; (C) the sympathetic system. The anatomy and physiology of many of these parts are treated in separate articles (*see* BRAIN; SPINAL CORD; NERVE; EYE, HUMAN; EAR, ANATOMY OF; OLFACTORY SYSTEM; SMELL AND TASTE; TOUCH, SENSE OF; MUSCULAR SYSTEM, ANATOMY OF; and also SYMPATHETIC SYSTEM). The object here is to deal with anatomical points which are common to the whole system, or for which a place does not conveniently occur elsewhere.

HISTOLOGY OF THE NERVOUS SYSTEM

Three kinds of tissue are found in the nervous system, *nerve fibres, nerve cells* and a supporting tissue called *neuroglia.*

Nerve Fibres may be medullated or non-medullated, but, whichever they are, they consist of the long process or *axon* of a nerve cell; in a non-medullated nerve this process is either naked or enclosed in a delicate membrane called the *primitive sheath* or *neurilemma,* but in a medullated nerve the process or *axis cylinder* is encased by a white fatty substance called myelin, and so the term "myelinated" is often used instead of "medullated" for these nerves (fig. 1). Outside this white sheath the neurilemma is present in most nerves, but is lost when they are massed to form

the white matter of the central nervous system and in the optic nerve. At regular intervals the myelin is interrupted by some substance which stains deeply with silver nitrate, and these breaks are known as *nodes of Ranvier.* They do not, however, affect the axis cylinder. In a large nerve, *e.g.*, the median, the nerve fibres are collected into small bundles (*funiculi*), enclosed in a connective tissue sheath (*perineurium*), and separated from it by a lymph space. From this sheath delicate processes penetrate among the fibres (*endoneurium*). The funiculi are collected into bundles called *fasciculi*, and the whole nerve consists of a variable number of fasciculi surrounded by a dense fibrous sheath, the *epineurium*.

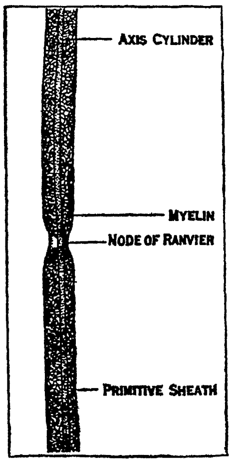

FIG. 1.—STRUCTURE OF A SINGLE NERVE FILAMENT

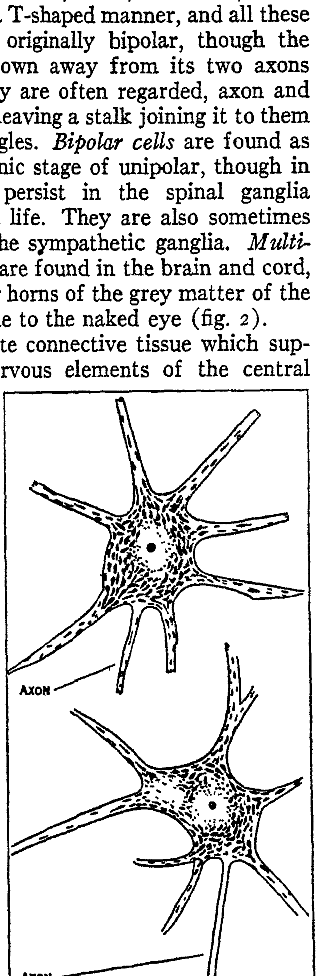
Nerve Cells are unipolar, bipolar or multipolar. *Unipolar cells* are found in the ganglia on the posterior roots of the spinal nerves, and only give off an axon or axis cylinder process; this, however, soon divides in a T-shaped manner, and all these cells were originally bipolar, though the cell has grown away from its two axons (or, as they are often regarded, axon and dendrite), leaving a stalk joining it to them at right angles. *Bipolar cells* are found as an embryonic stage of unipolar, though in fish they persist in the spinal ganglia throughout life. They are also sometimes found in the sympathetic ganglia. *Multipolar cells* are found in the brain and cord, and are best studied in the anterior horns of the grey matter of the latter, where they are nearly visible to the naked eye (fig. 2).

Neuroglia.—This is the delicate connective tissue which supports and binds together the nervous elements of the central nervous system. One part of it, which lines the central canal of the cord and ventricles of the brain, is formed of columnar cells (*ependyma*), while the rests consists of small cells with numerous processes which sometimes branch and sometimes do not.



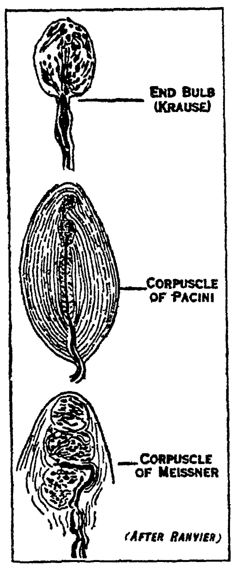
FROM "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)
FIG. 2.—NERVE CELLS FROM THE ANTERIOR HORN OF GREY MATTER OF THE HUMAN SPINAL CORD

Nerve Endings.—Sensory nerves end by breaking up into fibrillae or by various tactile organs. In the former case the minute fibrils composing the axons or nerve fibres separate and end among epithelial cells of the mucous membrane or skin. In the latter case the nerve fibres lose their myelin sheath and end in one of the seven following organs:—

1. *End bulbs of Krause* (*see* fig. 3), oval bulbs composed of elongated cells among which the nerve fibrils end in knobs or coils; each is surrounded by a sheath of neurilemma, and the organs are found in the lips, tongue, conjunctiva, epineurium of nerves, synovial membranes of joints, and in the glans penis et clitoridis, where they have a mulberry-like appearance.

2. *Pacinian corpuscles* (fig. 3) are large enough to be seen by the naked eye, and are oval bodies made up of a series of concentric capsules of connective tissue rather resembling the structure of an onion; in the centre is a structureless core, at the distal extremity of which the nerve fibre ends in one or more knobs. These bodies are found in the palm and sole, in the mesentery, the genital organs and in joints.

3. *Tactile corpuscles of Meissner and Wagner* (fig. 3) are oval bodies found in certain of the skin papillae and mucous membrane, especially of very sensitive parts like the hand and foot, lips, tongue and nipple. They are oval and made of a connective tissue capsule from which septa enter the interior. The nerve fibre generally takes a spiral course through them, loses its myelin sheath, and ends by breaking up into its fibrils, which eventually become bulbous.



FROM R. HOWDEN, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY"
FIG. 3.—TACTILE CORPUSCLES

4. *Tactile corpuscles of Grandry* are found in the skin of those parts devoid of hair, and consist of a capsule containing two or more largish cells, between which the nerve fibre ends in the so-called tactile discs.

5. *Ruffini's endings* are flattened oval bodies with a thick connective tissue capsule, in which the nerve fibre divides into many varicose branches, form a rich plexus, and end in knobs. They are found between the true skin and subcutaneous tissues of the fingers.

6. *Organs of Golgi* occur in tendons. Nerve fibres penetrate the tendon bundles and divide in a tree-like manner to end in little disks and varicosities.

7. *Neuro-muscular spindles* are small fusiform bundles of embryonic muscle fibres, among which the nerve fibres end by encircling them and forming flattened disks. These are sensory endings, and must not be confused with the motor end plates.

Motor nerves end in striped muscle by *motor end plates.* These are formed by a nerve fibre approaching a muscle fibre and suddenly losing its myelin sheath while its neurilemma becomes continuous with the sarcolemma of the muscle fibre. The axis cylinder divides, and its ramifications are surrounded by a disk of granular matter containing many clear nuclei.

THE SYMPATHETIC SYSTEM

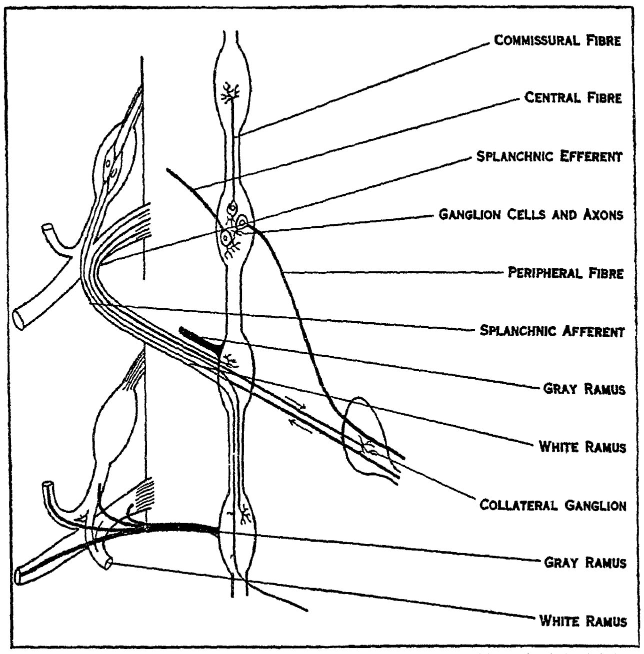
This system is made up of two gangliated cords running down one on each side of the vertebral column and ending below in the median coccygeal ganglion. In the neck the cords lie in front of the anterior tubercles of the transverse processes of the cervical vertebrae, in the thorax, in front of the heads of the ribs, while in the abdomen they lie in front of the sides of the bodies of the vertebrae. In addition to these cords there are numerous ganglia and plexuses through which the sympathetic nerves pass on their way to or from the viscera and blood-vessels.

A typical ganglion of the sympathetic chain is connected with its corresponding spinal nerve by two branches called *rami communicantes,* one of which is grey and the other white (fig. 4). The white consists of medullated fibres belonging to the central nervous system, and these are splanchnic afferent or centripetal, and efferent or centrifugal. The efferent fibres lie in the anterior roots of the spinal nerves, and, like all the fibres there, are either motor or secretory. They are the motor paths for the unstriped muscle of the vessels and viscera, and the secretory paths for the cells of the viscera. In the course of each fibre from the nerve cell in the spinal cord, of which it is an axon, to the vessel or viscus it supplies, there is always a break where it arborizes round a ganglion cell, and this may be in its own ganglion of the sympathetic chain, in a neighbouring ganglion above or below, or in one of the so-called collateral ganglia interposed between the sympathetic chain and the viscera.

The grey rami communicantes are found in connection with all the spinal nerves, though they are irregular in the paths by which they reach the sympathetic ganglia from the cells of which they spring; their fibres are mainly non-medullated, and pass into both roots of the spinal nerves and also into the anterior and posterior primary divisions of those nerves. In this way they reach the body wall and limbs, and are somatic vaso-motor, secretory and pilo-motor fibres, supplying the vessels, glands and hair muscles of the

skin and its glands.

In the gangliated chain there is a ganglion corresponding to nearly each spinal nerve, except in the neck, where only three are found; of these the superior cervical ganglion is more than an inch long, and is connected with the first four spinal nerves as well as with the ninth, tenth and twelfth cranial nerves (fig. 5). Branches of distribution pass from it to the pharyngeal plexus,



FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 4.—SCHEME OF THE CONSTITUTION AND CONNECTIONS OF THE GANGLIATED CORD OF THE SYMPATHETIC

the heart and the two carotid arteries. Of these the branch accompanying the internal carotid artery passes to the carotid and cavernous plexuses, and through these communicates with the spheno-maxillary, otic and ciliary ganglia, while the branch to the external carotid communicates with the submaxillary ganglion. The middle cervical ganglion (fig. 5), when it is present, gives rami communicantes to the fifth and sixth cervical nerves, as well as branches of distribution to the thyroid body and heart.

The inferior cervical ganglion (fig. 5) lies behind the subclavian artery, and, besides the main connective cord, has a loop (ansa Vieussenii) joining it to the middle cervical ganglion in front of that vessel. It communicates with the seventh and eighth spinal nerves, and gives branches of distribution to the heart and to the subclavian artery and its branches, especially the vertebral. The thoracic part of the sympathetic cord has usually eleven ganglia, which receive both white and grey rami communicantes from the spinal nerves (fig. 6); of the former the upper ones run up in the chain and come off from the cervical ganglia as already described, while the lower ones form the three abdominal splanchnics which pass through the diaphragm (*q.v.*) and join the abdominal plexuses.

The great splanchnic (fig. 6) comes from the sixth to the ninth ganglia, and ends in the semi-lunar ganglion of the solar plexus. The small splanchnic comes from the ninth and tenth, or tenth and eleventh ganglia, and ends in the aortico-renal ganglion of the solar plexus, while the smallest splanchnic comes from the last thoracic ganglion, whether it be the tenth or eleventh, and ends in the renal plexus.

In the lumbar region the gangliated cord is very irregular; there may be four or more ganglia, and these are often fused. Gray rami communicantes are given to all the lumbar spinal nerves, and white ones are received from the first two. Most of the branches of distribution pass to the aortic plexus. The sacral gangliated cord runs down just internal to the anterior sacral foramina; it usually has four small ganglia, and the two cords end by joining the coccygeal ganglion or ganglion impar, though the two-fourth sacral ganglia are united by transverse interfunicular commissures. The white rami communicantes, already mentioned as the pelvic stream, from the second to the fourth sacral spinal nerves, do not enter the ganglia but pass directly to the pelvic plexuses (fig. 6).

Sympathetic Plexuses.—In the thorax are the superficial and deep cardiac plexuses and the coronary plexuses; the former receives the left superior cervical cardiac of the vagus, and lies in the concavity of the arch of the aorta. The deep cardiac plexus is larger, and lies in front of the bifurcation of the trachea; it receives all the other cardiac nerves, and communicates with the anterior pulmonary plexuses of the vagus (*see* NERVE: *Cranial*).

In the abdomen the solar plexus is by far the most important. It lies behind the stomach and surrounds the coeliac axis; in it are situated the semilunar, aortico-renal and superior mesenteric ganglia, and from it are prolonged subsidiary plexuses along the main arteries, so that diaphragmatic, suprarenal, renal, spermatic, coeliac, superior mesenteric, aortic and inferior mesenteric plexuses, are recognized. The hypogastric plexus is the continuation downward of the aortic, and lies just below the bifurcation of the aorta (fig. 6); it divides into two branches, which accompany the internal iliac arteries and are joined by the pelvic stream of white rami communicantes from the sacral spinal nerves and some twigs from the ganglia of the sacral sympathetic to form the pelvic plexuses. These are prolonged to the viscera along the branches of the internal iliac artery, so that haemorrhoidal, vesical, prostatic, vaginal and uterine plexuses are found. By the side of the neck of the uterus in the last-named plexus several

small ganglia are seen. (For the literature of the sympathetic system, *see* Quain, *Anatomy*, London.)

EMBRYOLOGY OF NERVOUS SYSTEM

The development of the brain, spinal cord and organs of special sense (eye, ear, tongue), will be found in separate articles. Here that of the cranial and spinal nerves and the sympathetic system is dealt with. The thoracic spinal nerves are the most typical, and one of them is the best to begin with. In fig. 7 the ganglion on the dorsal root is seen growing out from the neural crest, and the cells or neuroblasts of which it is composed become fusiform and grow in two directions as the ganglion recedes from the cord. Those which run toward the spinal cord are the axons, while those growing into the mesoderm are probably enlarged dendrites. The ventral roots rise as the axons of the large cells in the ventral

horn of the grey matter, and meet the fibres of the dorsal root on the distal side of the ganglion. As the two roots join each divides into an anterior (ventral) and a posterior (dorsal) primary division, the latter growing into the dorsal segment of its muscle plate and the skin of the back. The anterior primary division grows till it reaches the cardinal vein and dorsal limit of the coelom, and there forks into a somatic branch to the body

FIG. 6.—THE ARRANGEMENT OF THE SYMPATHETIC SYSTEM IN THE THORAX, ABDOMEN AND PELVIS

wall, and a splanchnic or visceral branch which joins the sympathetic and forms the white ramus communicans. The somatic branch grows round the body wall and gives off lateral and anterior branches.

The cranial nerves are developed in the same way as the spinal, so far as concerns the facts that the motor fibres are the axons of cells situated in the basal lamina of the mesencephalon and

FIG. 7.—DEVELOPMENT OF THE SPINAL NERVES

rhombencephalon (*see* BRAIN), and the sensory are the axons and dendrites of cells situated in ganglia which have budded off from the brain. The evidence of comparative anatomy, however, shows that the cranial nerves cannot be directly homologized with the spinal, nor can the fact of there being twelve of them justify us in assuming that the head contains the rudiments of twelve fused or unsegmented somites.

The sympathetic system is developed from the posterior root ganglia of the spinal nerves, by cells which in man migrate a few at a time. A. M. Paterson, however, believes that the sympathetic is developed, independently of the cerebro-spinal system, in the mesoderm (*Phil. Trans.*, B. clxxxi.).

COMPARATIVE ANATOMY

The comparative anatomy of the brain and spinal cord is dealt with in the separate articles devoted to them.

In *Amphioxus* the dorsal and ventral roots of the spinal nerves do not unite with one another but alternate, a dorsal root on one side being opposite a ventral on the other. The dorsal roots are both sensory and motor, the ventral only motor. In the Cyclostomata (*Petromyzon*) the arrangement is nearly the same, but in some regions there are two ventral roots to one dorsal. In the

fishes and higher vertebrates the dorsal and ventral roots unite, though in selachian (shark) embryos the dorsal and ventral roots alternate (F. M. Balfour, *The Development of Elasmobranch Fishes*, London, 1878).

The cranial nerves are only represented by two pairs in *Amphioxus*. In the Cyclostomata, fishes and Amphibia, ten pairs of nerves are found, which in their distribution do not always agree with those of man. In the Amniota or reptiles, birds and mammals, the eleventh and twelfth nerves have been added. The cranial nerves are formed of at least five components: (1) ventral motor, (2) lateral motor, (3) somatic sensory, (4) visceral sensory, (5) lateral line nerves.

The *ventral motor components* are those which rise from cells situated close to the mid line, and probably correspond to the ventral roots of the spinal nerves. The nerves to the eye muscles (motor oculi, trochlearis and abducens) have this origin (*see* NERVE: *Cranial*), as also has the hypoglossal, which doubtless is a cephalized spinal nerve.

The *lateral motor components* rise from cells situated more laterally, and comprise the motor roots of the fifth (trigeminal), seventh (facial), and ninth, tenth and eleventh (glossopharyngeal, vagus and spinal accessory). These nerves supply muscles belonging to the branchial skeleton, instead of the muscles of the primitive cranium, of which the eye muscles are the remnants.

The *somatic sensory components* supply the skin, and end in cells which, among the cyclostomes and fishes, form a considerable elevation in the rhombencephalon, known as the nucleus quinti (fig. 8). These components, in the lower forms, are found in the fifth, seventh and tenth nerves, but in mammals practically only the fifth contains them. They correspond to the dorsal roots of the spinal nerves.

The *splanchnic sensory* or *viscero sensory components* end in the brain in the medullary cells known as the *fasciculus communis* in fishes, and named the *fasciculus solitarius* in mammals, as well as in the nucleus vagi (fig. 8). They are found in the fifth, seventh, ninth, tenth and eleventh nerves, and supply visceral surfaces. In mammals the lingual and palatine branches of the fifth, the chorda tympani and great superficial petrosal of the seventh, and all the sensory fibres of the ninth and tenth except Arnold's nerve, represent these. In fishes and Amphibians the palate is supplied by the seventh nerve instead of the fifth.

FIG. 8.—A. BRAIN. B. CHOROID PLEXUSES OF LAMPREY

The system of the lateral line or acustico-lateralis component is sometimes regarded merely as a subdivision of the somatic sensory. It is best developed in the fish, and may be divided into pre- and post-auditory and auditory. The pre-auditory part comprises the pit and canal end organs supplied by the seventh, and also probably the olfactory organ supplied by the first nerve. The auditory apparatus, supplied by the eighth nerve, is, according to modern opinion, undoubtedly a part of this system, while the tenth nerve sends a large branch along the lateral line supplying the special end organs of the post-auditory part.

The following table, slightly modified from the one drawn up by J. McMurrich, gives a fair idea of the present state of our knowledge of the nerve components in the Mammalia.

NESFIELD, WILLIAM EDEN (1835–1888), British architect, one of the leaders of the Gothic revival in England, was born in Bath on April 2, 1835, and died in Brighton on March 25, 1888. His father, Maj. William Andrews Nesfield, a well-known landscape gardener, laid out Regent's park and St. James's park and remodelled Kew. Nesfield was educated at Eton and articled successively to William Burn, a classicist, and Anthony Salvin of the Gothic school. He then travelled for study in France, Italy and Greece. The volume of his *Sketches from France and Italy* (1862) became one of the text-books of the Gothic revival. In 1859 Nesfield settled in London and began in 1862 a nominal partnership with Norman Shaw, when they shared rooms, but never collaborated. Nesfield's principal work was in domestic architecture, wherein he showed a mastery of planning and construction and a conscientious regard for detail. As he progressed he forsook the early French style of his earlier work, as seen in Combe abbey and Cloverly hall (1864) and developed a purely English manner, coming at last to English renaissance, as at Kinmel park. Among his other notable works are the lodge at Regent's park (1864) and at Kew gardens (1866); Farnham Royal house, Leawood, Loughton hall, Westcombe park, the Rose and Crown hotel and the bank at Saffron Walden. Many of his sketches and measured drawings are in the library of the Royal Institute of British Architects.

NEST. Nidification or the practice of making nests concerns all that appertains to the preparation for the reception of eggs, or newly-born young, and the subsequent care thereof on emergence. Our conceptions of nidification are commonly derived from observations on birds; but mammals, reptiles, amphibia and fishes, as well as invertebrates, include species which make more or less elaborate preparation in advance for the reception of their young.

The first stage in this sequence commonly consists in the selection of a definite site whereon, with a few exceptions, a nest is built in, or on which the eggs, or young, are deposited. Two factors govern this preparation,—the conditions of the environment, and the state of the young on emergence.

NESTING HABITS OF BIRDS, MAMMALS, INVERTEBRATES AND FISHES

1. Nest of the humming bird (*Panterpe insignis*), Costa Rica, made of moss and spiders' webs. 2. Amazonian caciques (*Cacicus cela*), with their nest of woven grass suspended from a tree branch. 3. Nest of the Mexican cacique (*Zarhynchus wagleri*), sometimes several feet in length, made of grass and strips of palm leaf. 4. Reed warbler (*Acrocephalus phragmitis*), England, and its cup-shaped nest of reed stems supported by several upright reeds. 5. The feathered nest of the palm swift (*Tachornis*), usually agglutinated to the under surfaces of palm leaves or grass roofs of huts. 6. Hanging nest of the Turkistan *Remera* (*Remiza caspia*), formed of dried grasses and feathers. The bottleneck entrance affords protection against intruders. 7. Nest of the social weaver bird (*Philetaerus socius*), Africa. It consists of an umbrella-shaped roof of grass sheltering an under surface honeycombed with numerous feather-lined cavities. 8. Hanging nest of the *Remera* (*Remiza pendulina*) of Rumania, constructed of lichens, mosses and grass, lined with feathers. 9. Clay nest of the red ovenbird (*Furnarius rufus*), South America, usually about a foot in diameter. 10. Nest of twigs lined with dry leaves built by a group of anis (*Crutophaga ani*), Mexico. It is large enough to accommodate all the females of the company who deposit their eggs in layers separated by leaves. 11. Nest of the woodcock (*Philohela minor*), a hollow scratched in the ground. 12. View of a gopher turtle habitat (*Gopherus polyphemus*) (Daudin) in a sand dune showing the pile in front of the burrow and the cavity where the turtle deposits its eggs. 13. Nest of the cape (African) weaver birds (*Sitagra capensis*), constructed of grass stems and vegetable fibres suspended by long "arms" from trees, bushes or eaves. 14. Underground burrow of the mole (*Talpa europaea*), lined with grass. 15. Nest of the harvest mouse (*Mus minutus*), woven of grass and leaves of corn and attached to cornstalks. 16. Butterfish (*Pholis gunnellis*) coiled around an egg mass in the reversed upper valve of an empty oyster shell. 17. Red backed salamander (*Plethodon cinereus*) guarding its eggs in the moist shadow of a cave nest. 18. Nest of the grass spider (*Agalena*)

Birds.—With the birds a nest is not invariably made, as for example with the auks and murres whose single eggs are deposited on bare ledges of rock projecting from the face of a cliff rising steeply from the sea. Species which haunt sandy wastes make little or no preparation by way of a nest. This receptacle seems originally to have been made for the purpose of keeping the incubating bird, and the eggs, from contact with cold, damp earth.

Much more elaborate are the nests of the smaller species. These, placed in hedgerows or bushes or even on the ground, are bowl-shaped structures made of fine grass stems interwoven with horsehair, and cunningly masked by moss or lichen, as in the case of the European long-tailed titmouse. Some, like the thrush, use a foundation of clay, and line the interior of the nest with a mixture of decayed wood and cow dung. Some of the African weaverbirds, and of the American hangnests, suspend the nest, which is made of long grass stems, and vegetable fibres, by a long "rope" attached to the bough of a tree. Toward the end this rope is enlarged to form a spherical chamber, with an entrance at the top or side in the hangnests; and at the end of a further extension of the rope beneath the nest in the weavers. Some of the flowerpeckers of Africa build a nest of felted cotton-down. A few species make a more or less extensive use of saliva as a cement for mud-built nests, as with the swallow tribe, the South American ovenbird and the flamingo. The use of salivary glands in nest building attains to its maximum with the swifts which glue small twigs to the inside of a chimney to form a tiny basket or, as in the case of the Asiatic edible swifts, use saliva alone. Such nests are used by the Chinese in making bird's nest soup.

Hollows in trees are used by many birds, such as the parrots and the woodpeckers, the eggs being deposited on the rotten wood at the bottom of the hole. Others, like the sand martin and the kingfisher drive long tunnels into the face of a sandbank, enlarging the end of the tunnel to form a nest chamber. The greatness of this achievement is commonly overlooked; for it would be difficult to find birds more apparently unsuited for such a task, since the sand martin has the feeblest of feet and an extremely short beak, while the short legs and syndactyle toes of the kingfisher, coupled with its long, pointed beak, seem less fitted for burrowing.

While there is general conformity of type characteristic of the nests of the different groups of birds, there are striking exceptions to the rule. Thus, the stork tribe are content with a simple platform of sticks; but the hammerhead (*Scopus umbretta*) builds a huge nest of mud and sticks, covered in by a roof so substantial as to bear easily the weight of a man. This roof may be as much as 6 ft. across. The flamingo, again, builds a steep pedestal of mud, the top of which is scooped out to receive the eggs. Parrots nest in hollow trees, but the quaker-parrot (*Myopsittacus*) of South America builds a large domed nest of sticks.

The Gallinaceous birds make little more than an apology for a nest, fashioned in a depression in the ground. But the megapodes of Celebes, New Guinea and Australia build a huge mound of decaying vegetable matter, and laying their eggs deep down in the fermenting mass leave them to hatch by the heat thus engendered.

One of the most remarkable cases of nidification among birds is furnished by the hornbills. The eggs are laid at the bottom of a cavity in a tree, and as soon as the female has started incubation, the entrance hole is closed by the male by means of clay; but a space is left open wide enough for his mate to push her beak through to receive food. (*See* Birds: *Bird Nesting.*)

NONAVIAN NEST-MAKERS

Mammals.—Few other animals have attained to the skill in weaving displayed by birds. The harvest mouse among the mammals is, however, the rival of most birds and many squirrels build bulky structures in treetops or vines. The rabbit builds a nest in her burrow, and lines it with the under-fur plucked from her body, forming a parallel to the case of the ducks, geese and swans, which line the nest with down similarly plucked from the breast for this purpose.

The only nest-building mammals which produce eggs are the *Tachyglossus*, or spiny anteater, and the duck-billed platypus or *Ornithorhynchus*. The nest is of the simplest character, placed in a chamber at the end of a long tunnel dug by the animal.

Reptiles.—Among the reptiles nest-building goes little or no further than digging a hole in the ground, and depositing the eggs within it, leaving them to their fate as in the case of the megapodes among the birds. The European pond tortoise, however, takes a little more trouble. She first prepares the ground by watering it from the bladder, and from special anal water sacs. Then, boring a hole with the tail, as one would use a stick, the feet are used to enlarge it. When about five inches deep the eggs are laid at the bottom, and the soil is put back again and beaten down flat. The crocodile digs a hole in the sand nearly two feet deep, laying her eggs therein and covering them up. But she returns periodically to sleep above her treasures. She is thus at hand to assist the young to escape at the time of hatching. She is warned of this by the noise they make in endeavouring to break through the shell: just as young birds announce their advent by cheeping before the shell is actually broken. When they have all emerged the mother escorts them to the water. The alligator, on the other hand, like the muskrat, builds a great mound of decaying vegetation in a marsh to a height of about 3 ft. and as much as 8 ft. in diameter. Some 8 in. from the surface the eggs, 20 to 30, white and hard-shelled, are laid.

The python, among the snakes, like *Ichthyophis* among the Amphibia coils her body around the eggs until they hatch, and guards her young for some time after.

Amphibia.—The Amphibia furnish instances of nidification of a very remarkable character, and at the same time, provide valuable material for the study of behaviour in regard to the parental instincts to serve as a standard of comparison with the higher vertebrates on the one hand, and the lower on the other.

The frogs of the genus *Phyllomedusa* build nests recalling that of the tailorbird. The process of this nest-making has been watched in *Phyllomedusa hypochondria,* the *Wollenkukk* of the Paraguayan Chaco. The female carries the male upon her back while searching for a suitable leaf—which must be of some tree overhanging the water. This found, both then seize it and hold the edges together with their hindfeet, while the female pours her eggs into the funnel thus formed, the male fertilizing them as they pass in. The gelatinous envelope of the eggs suffices to hold the leaf edges in position as they are brought together in the filling process which goes on until about 100 eggs are laid.

Fishes.—Among the fishes the fresh-water sticklebacks (*Gasterosteus*) and the marine 15-spine stickleback (*Spinachia*) build nests of weeds, the task being undertaken by the male, who uses, as a binding material, a secretion formed by the kidneys. He undertakes the sole charge of the eggs and young. The gourami (*Osphronemus*) of the Malay archipelago fashions a nest of air bubbles toughened by a kind of saliva, and mounts guard over both eggs and young. The Cichlid fishes both of America and the old world, as well as some of the Siluroid fishes, carry the young in the mouth; in some species both sexes do this, in others the male alone. The male pipefish carries the eggs and young in a pouch running along the belly. The Aspredo of the Guianas carries her eggs attached to the under surface of the head, belly and paired fins. For their accommodation the skin assumes a spongy condition so that each comes to lie within a deep depression, recalling the egg pits of the Surinam toad, but in the case of Aspredo the pits are shallow and the larvae are not retained there.

Invertebrates.—Among the insects the elaborate care for the eggs and young displayed by the ants, bees and wasps is too well known to need further mention. The scorpions and the wolf spiders carry their young about on their backs until they can fend for themselves; and some of the scorpions, again, like the wolf spiders, bear their eggs about closely packed within a spherical silken bag.

Among the Echinoderms we find an antarctic sea-slug (*Cucumaria crocea*) carrying the young on its back. One of the sea urchins (*Hemiaster philippi*), and a starfish (*Asterias spirabilis*) carry the young in brood pouches on the back in the case of the sea urchin, and around the mouth in the starfish. It would seem that only arctic and antarctic species behave after this fashion.

In all other cases the young leave the parent as minute, free-swimming larvae, undergoing a complicated metamorphosis before attaining to the adult form. Here, then, we must regard the care of the young as an entirely impersonal, unconscious act, determined by the physical peculiarities of the external environment. This is a factor to be borne in mind in considering the origin, and evolution, of nidification in animals of all grades. (W. P. P.; X.)

NESTOR (*c.* 1056–*c.* 1114), the reputed author of the earliest Russian chronicle, was a monk of the Pecherskiy cloister of Kiev from 1073. The only other known fact of his life is that he was commissioned with two other monks to find the relics of St. Theodosius, a mission which he succeeded in fulfilling. The chronicle begins with the deluge, as those of most chroniclers of the time did. The compiler appears to have been acquainted with the Byzantine historians; he makes use especially of John Malalas and George Hamartolus. He also had in all probability other Slavonic chronicles to compile from, which are now lost. Many legends are mixed up with Nestor's *Chronicle;* the style is occasionally so poetical that perhaps he incorporated *byliny* which are now lost. The early part is rich in these stories, among which are the arrival of the three Varangian brothers, the founding of Kiev, the murder of Askold and Dir, the death of Oleg, who was killed by a serpent concealed in the skeleton of his horse, and the vengeance taken by Olga, the wife of Igor, on the Drevlians, who had murdered her husband. The account of the labours of Cyril and Methodius among the Slavs is also very interesting, and to Nestor we owe the tale of the summary way in which Vladimir suppressed the worship of Perun and other idols at Kiev. As an eyewitness he could only describe the reigns of Vsevolod and Sviatopolk (1078–1112), but he gathered many interesting details from the lips of old men, two of whom were Giurata Rogovich of Novgorod, who gave him information concerning the north of Russia, Petchora, and other places, and Jan, a man ninety years of age, who died in 1106, and was son of Vishata the voivode of Yaroslavl and grandson of Ostromir the Posadnik, for whom the *Codex* was written. Many of the ethnological details given by Nestor of the various races of the Slavs are of the highest value.

The latest theory about Nestor is that the *Chronicle* is a patchwork of many fragments of chronicles, and that the name of Nestor was attached to it because he wrote the greater part or perhaps because he put the fragments together.

The Chronicle has come down to us in several manuscripts, but unfortunately no contemporary ones, the oldest being the so-called Lavrentievski of the 14th century (1377). It was named after the monk Lavrentii, who copied it out for Dimitri Constantinovich, the prince of Souzdal. The work, as contained in this manuscript, has had many additions made to it from previous and contemporary chronicles, such as those of Volinia and Novgorod. Soloviev, the Russian historian, remarks that Nestor cannot be called the earliest Russian chronicler, but he is the first writer who took a national point of view in his history, the others being merely local writers. The language of his work, as shown in the earliest manuscripts just mentioned, is Palaeo-Slavonic with many Russisms.

The *Chronicle* has been translated into Polish, Bohemian, German and French. The compiler cannot very well be the author of the lives of Boris and Gleb, the martyrs, and of the life of St. Theodosius, because they contradict many passages in the *Chronicle.* The work is of primary importance for early Russian history, and has amusing episodes of an Herodotean character. The reputed body of the ancient chronicler may be seen among the relics preserved in the Pecherskiy monastery at Kiev.

See Louis Leger, *Chronique dite de Nestor* (Paris, 1884); Bestuzhev Riumin, *On the Composition of the Russian Chronicles till the end of the 14th century* (in Russian) (St. Petersburg, 1869). (W. R. Mo.)

NESTOR, in Greek legend, son of Neleus and Chloris, king of Pylos (Kakovátos) in Elis. When all his brothers were slain by Heracles, in consequence of the refusal of Neleus to purify him for the murder of Iphitus, Nestor alone escaped. In the *Iliad,* he is about 70 years old, full of good advice and of stories of his early exploits. In the *Odyssey,* he is seen by Telemachus at Pylos. The name is used in modern times for any old man of ripe experience, or the oldest member of a class or corporation.

NESTOR, the name of a small group of parrots peculiar to New Zealand. The type is *Nestor meridionalis,* the kaka, an olive-brown bird about as big as a crow. The larger *N. notabilis,* the kea (*q.v.*) has developed the habit of attacking sheep to obtain the kidneys. It also eats carrion, grubs, fruits and seeds. A third, more brightly coloured species is said to have inhabited Norfolk Island and a fourth Phillip Island; both of these are now extinct and no specimens of the former are known to exist.

NESTORIANS. The present article deals not with the life and doctrine of Nestorius (*q.v.*) but with the Eastern Churches called by his name.

A christology of the kind usually called Nestorian was eagerly and successfully propagated in Syria and Persia by Ibas, bishop of Edessa (435) and Barsumas, bishop of Nisibis. In Persia the old churches were stimulated into vigour and new ones founded. Their centre was at Ctesiphon on the Tigris, a busy trading city. The church traced its doctrines to Theodore of Mopsuestia rather than to Nestorius, whose name at first they repudiated, not regarding themselves as having been proselytized to any new teaching. After the Mohammedan invasion of Persia early in the 7th century the Nestorians were able to come to terms with the invaders; and for five centuries the Nestorians were a recognized institution within the territory of Islam, though their treatment varied from kindly to harsh. But the barbaric invasions of the 13th and 14th centuries fell with crushing force on the Nestorians. In 1258 Hulagu Khan took Baghdad, and about 1400 Timur again seized and sacked the city. Though the Nestorians were numerous, their moral influence and their church life had greatly deteriorated. Those who escaped capture by Timur fled to the mountains of Kurdistan, and the community that had played so large a part in Mesopotamian history for a thousand years was thus shattered. Various attempts during the 16th century to promote union between the Nestorians and Rome proved fruitless, but the Roman Church has never ceased in its efforts to absorb this ancient community.

The Nestorians showed a zeal for evangelization which resulted in the establishment of their influence throughout Asia, as is seen from the bishoprics founded not only in Syria, Armenia, Arabia and Persia, but at Halavan in Media, Merv in Khurasan, Herat, Tashkent, Samarkand, Baluk, Kashgar, and even at Kambaluk (Pekin) and Singan fu (Hsi'en fu) in China, and Kaljana and Kranganore in India. Mongolian invasions and Mohammedan tyranny have, of course, long since swept away all traces of many of these. The 400,000 Syrian Christians ("Christians of St. Thomas," *see* THOMAS, ST.) who lived in Malabar no doubt owed their origin to Nestorian missionaries, the stories of the evangelization of India by the Apostles Thomas and Bartholomew having no real historical foundation, and the Indian activity of Pantaenus of Alexandria having proved fruitless, in whatever part of India it may have been exercised. The theology of the Indian Syrian Christians is of a Nestorian type, and Cosmas Indicopleustes (6th century) puts us on the right track when he says that the Christians whom he found in Ceylon and Malabar had come from Persia (probably as refugees from persecution, like the Huguenots in England and the Pilgrim Fathers in America). Pehlevi inscriptions found on crosses at St. Thomas's Mount near Madras and at Kottayam in Travancore, are evidence both of the antiquity of Christianity in these places (7th or 8th century), and for the semi-patri-passianism (the apparent identification of all three persons of the Trinity in the sufferer on the cross) which marked the Nestorian teaching. In 745 Thomas of Kana brought a new band of emigrants from Baghdad and Nineveh, and possibly the name "Christians of St. Thomas" arose from confusion between this man and the apostle. Other reinforcements came from Persia in 822, but the Malabar church never developed any intellectual vigour or missionary zeal. They had their own kings, lived as a close caste, and even imitated the Hindus in caste regulations of food and avoidance of pollution. In 1330 Pope John XXII. issued a bull appointing Jordanus, a French Dominican, bishop of Quilon, and inviting the Nestorians to enter "the Christian Church." The

invitation was declined, but in the 16th century the Syrian Christians sought the help of the Portuguese settlers against Mussulman oppression, only to find that before long they were subjected to the fiercer perils of Jesuit antagonism and the Inquisition. The Syrians submitted to Rome at the synod of Dampier in 1599, but it was a forced submission, and in 1653 when the Portuguese arrested the Syrian bishop just sent out by the catholicus of Babylon, the rebellion broke out. The renunciation was not quite thorough, one party adhering to the Roman Church as Romo-Syrians, the others reverting wholly to Syrian usages and forming to-day about three-fourths of the whole community.

WIDESPREAD MISSIONS

Early evidence of Nestorian missions in China is extant in the tablet found in 1625 at Chang'an in the district of Hsi'en-fu, province of Shensi. It commemorates "the introduction and propagation of the noble law of Ta t'sin in the Middle Kingdom," and beneath an incised cross sets out in Chinese and Syriac an abstract of Christian doctrine and the course of a Syrian mission in China beginning with the favourable reception of Olopan, who came from Judaea in 636. For two generations the little cause prospered, and again after persecutions in 699 and 813. Later on a second mission arrived, many churches were built and several emperors patronized the faith.

In the 10th century the Nestorians introduced Christianity into Tartary proper; in 1274 Marco Polo saw two of their churches. The legend of Prester John is based on the idea of the conversion of a Mongol tribe, the Karith, whose chieftain Ung Khan at baptism received the title Malek Juchana (King John). Their activity may well be said to have covered the continent. Their campaign was one of deliberate conquest, one of the greatest ever planned by Christian missionaries. Marco Polo is witness that there were Nestorian churches all along the trade routes from Baghdad to Pekin.

The Modern Nestorians.—The Nestorians or East Syrians (*Surayi*) of Turkey and Persia now inhabit a district bounded by Lake Urmia, or Urumia, on the east, stretching westwards into Kurdistan, to Mosul on the south, and nearly as far as Van on the north. It is only of late years, under the influence of the different missions, that education, ruined by centuries of persecution, has revived amongst the Nestorians; and even now the mountaineers, cut off from the outer world, are as a rule destitute of learning, and greatly resemble their neighbours, the wild and uncivilized Kurds. They are, however, extraordinarily tenacious of their ancient customs, and, almost totally isolated from the rest of Christendom since the 5th century, they afford an interesting study to the ecclesiastical student. Their churches are rude buildings, dimly lighted and destitute of pictures or images, save that of the Cross, which is treated with the deepest veneration. There are three liturgies—of the Holy Apostles, of Theodore and of Nestorius. The first is quite free from Nestorian influence, dates from some remote period, perhaps prior to 431, and is certainly the most ancient of those now in use in Christendom; the other two, though early, are undoubtedly of later date. The Nestorian canon of Scripture seems never to have been fully determined, nor is the sacramental system rigidly defined. Nestorian writers, however, generally reckon as sacraments the Priesthood, the Oil of Unction, the Offering of the Body and Blood of Christ, Absolution, the Holy Leaven and the Signation of the life-giving Cross. The "Holy Leaven" is reputed to be a part of the original bread of the first Eucharist, brought by Addai and Mari and maintained ever since in the Church; it is used in the confection of the Eucharistic wafers, which are rather thicker than those used in the Western Church. Communion is given in both kinds, as throughout the East; likewise, confirmation is administered directly after baptism. Sacramental confession is enjoined, but has recently become obsolete; prayers for the departed and invocation of saints form part of the services. The bishops are always celibates and are chosen from episcopal families. The service-books were wholly in ms. until the press of the archbishop of Canterbury's mission at Urmia issued the *Takhsa* (containing the liturgies, baptismal office, etc.) and several other liturgical texts.

The Nestorians commemorate Nestorius as a saint, and invoke his aid and that of his companions. They reject the Third Oecumenical Council, and though showing the greatest devotion to the Blessed Virgin, deny her the title of *Theotokos, i.e.,* the mother or bearer of God. Their theological teaching is misty and perplexing; but systematic or even consistent theological thinking is not their primary interest (*see* J. F. Bethune-Baker, *Nestorius and his Teaching*). The peculiar circumstances, both ecclesiastical and temporal, of the Nestorians have attracted much attention in western Christendom, and various missionary enterprises amongst them have resulted (*see* authorities named below).

NESTORIUS (d. *c.* 451), Syrian ecclesiastic, patriarch of Constantinople from 428 to 431, was a native of Germanicia at the foot of Mount Taurus, in Syria. The year of his birth is unknown. He received his education at Antioch, probably under Theodore of Mopsuestia. As monk in the neighbouring monastery of Euprepius, and afterwards as presbyter, he became famous in the diocese for his asceticism, his orthodoxy and his eloquence. He was nominated by Theodosius II. patriarch of Constantinople, and was consecrated on April 10, 428. He immediately set to work to extirpate heresy in his diocese, beginning by the suppression of the assemblies of the Arians. These, by a bold stroke of policy, anticipated his action by themselves setting fire to their meeting-house, Nestorius being forthwith nicknamed "the incendiary." His repression of the Novatians and the Quartodecimans led to serious disturbances at Sardis and Miletus. The toleration the followers of Macedonius had long enjoyed was also broken, the recently settled Pelagians alone finding any respite. One of the practices assailed by Nestorius was the custom, which had become almost universal in Constantinople, of bestowing the epithet Θεοτόκος "Mother of God," upon Mary the mother of Jesus. From Antioch Nestorius had brought along with him to Constantinople a co-presbyter named Anastasius, who enjoyed his confidence and is called by Theophanes his "syncellus." This Anastasius, in a pulpit oration which the patriarch himself is said to have prepared for him, caused great scandal to the partisans of the cult of Mary by saying, "Let no one call Mary the mother of God, for Mary was a human being; and that God should be born of a human being is impossible."

Cyril (*q.v.*) of Alexandria seized his opportunity. He stirred up his own clergy, he encouraged the dissidents at Constantinople, he addressed himself to the sister and wife of the emperor, and he bribed the officials of the court. He also sent to Rome a careful selection of Nestorius's sayings and sermons. Nestorius himself, on the other hand, having occasion to write to Pope Celestine I. about the Pelagians (whom he was not inclined to regard as heretical), gave from his own point of view an account of the disputes which had recently arisen within his patriarchate. Celestine naturally resented any questioning of the Roman decision concerning the Pelagians, and was jealous of the growing power of the Constantinople see. In a synod which met in 430, he decided in favour of the title Θεοτόκος, bade Nestorius retract his erroneous teaching, on pain of instant excommunication, and entrusted the execution of this decision to the patriarch of Alexandria.

In this situation of affairs the demand for a general council became irresistible, and accordingly Theodosius and Valentinian III. issued letters summoning the metropolitans of the Catholic church to meet at Ephesus at Whitsuntide 431, each bringing with him some able suffragans. Nestorius, with sixteen bishops and an armed following, Cyril with fifty bishops, Juvenal of Jerusalem, and Flavian of Thessalonica arrived. John of Antioch was delayed on his journey, and wrote requesting that the opening of the

synod should not be delayed on his account. Cyril and his friends assembled in the church of the Theotokos on June 22, and summoned Nestorius to give an account of his doctrines. He replied that he would appear when all the bishops were assembled; and the imperial commissioner, Candidian, formally protested against the opening of the synod. Cyril and the 159 bishops who were with him nevertheless proceeded to read the imperial letter of convocation, and afterwards the letters which had passed between Nestorius and Cyril. The entire assembly then cried anathema on Nestorius and his doctrines, and the decree of his exclusion from the episcopate and from all priestly communion was solemnly read and signed by all present. The accused and his friends never had a hearing.

The populace accompanied the members with torches and censers to their lodgings, and there was a general illumination of the city. A few days afterwards (June 26th or 27th) John of Antioch arrived; whether inclined or not to the cause of his former copresbyter, he disapproved the precipitancy with which Cyril had acted, and at a *conciliabulum* of forty-three bishops held in his lodgings he was induced by Candidian, the friend of Nestorius, to depose the bishops of Alexandria and Ephesus on the spot. The Ephesians intervened to prevent the execution of this decision on the next Sunday. Meanwhile a letter from the emperor declared invalid the session at which Nestorius had been deposed unheard; numerous sessions and counter-sessions were afterwards held, the conflicting parties both seeking the imperial support. In the end Theodosius decided to confirm the depositions which had been pronounced on both sides, and Cyril and Memnon as well as Nestorius were by his orders laid under arrest. Representatives from each side were now summoned before him to Chalcedon, and at last, yielding to the sense of the evident majority, he gave a decision in favour of the "orthodox," and the council of Ephesus was dissolved. Maximian, one of the Constantinopolitan clergy, a native of Rome, was promoted to the vacant see, and Nestorius was henceforward represented in the capital only by one congregation, which presently became extinct.

But the Antiochenes maintained for some time an attitude of antagonism towards Cyril and his creed, and were not pacified until an understanding was reached in 433 on the basis of a new formula involving some concessions by him. The union even then was opposed by certain bishops, who were deposed from their sees. Their school at Edessa was closed by Zeno in 489. Immediately after his deposition Nestorius withdrew into private life in his old monastery of Euprepius, Antioch, until 435, when the emperor ordered his banishment to Petra in Arabia. A second decree, it would seem, sent him to Oasis, probably the city of the Great Oasis, in Upper Egypt, where he was still living in 439, at the time when Socrates wrote his *Church History*. He was taken prisoner by the Blemmyes, a nomad tribe that gave much trouble to the empire in Africa, and when they set him free in the Thebaid near Panopolis (Akhmim) *c.* 450, they exposed him to further persecution from Schenute, the hero of the Egyptian monks. There is some evidence that he was summoned to the Council of Chalcedon, though he could not attend it, and in the concluding portion of his book known as *The Bazaar of Heraclides* he not only gives a full account of the "Robber Synod" of Ephesus 449, but knows that Theodosius is dead (July 450) and seems aware of the proceedings of Chalcedon and the flight of Dioscurus, the unscrupulous successor of Cyril at Alexandria. Nestorius was already old and ailing and must have died very soon after. There are still Nestorians in Kurdistan, and the Syriac Church is Nestorian in theology, as are the churches in Asia founded by Nestorian missionaries in the middle ages.

Modern View.—Only recently has an attempt been made to judge Nestorius from some other evidence than that afforded by the accusations of Cyril and the inferences drawn therefrom. This other evidence consists partly of letters from Nestorius, preserved among the works of those to whom they were written, some sermons collected in a Latin translation by Marius Mercator, an African merchant who was doing business in Constantinople at the time of the dispute, and other material gathered from Syriac manuscripts. Since the helpful collection of *Nestoriana* published by Dr. F. Loofs in 1905 there has also come to our knowledge the most valuable evidence of all, Nestorius's own account of the whole difficulty, viz., *The Bazaar*[1] *of Heraclides of Damascus*. This pseudonym served to protect the book against the fate that overtook the writings of heretics, and in a Syriac version it was preserved in the Euphrates valley where the followers of Nestorius settled. Ebed Jesu in the 14th century mentions it together with *Letters* and *Homilies*, as well as the *Tragedy*, or a *Letter to Cosmas*, the *Theopaschites* (of which some fragments are still extant) and the *Liturgy*, which is still used by the Nestorian Church. The discovery of *The Bazaar*, which is the *Apologia* of Nestorius, was made public by Dr. H. Goussen (though members of the Archbishop of Canterbury's Mission to the Assyrian Christians had previously been acquainted with the book). The text has been edited by P. Paul Bedjan (Leipzig, 1910) and a French translation has been made by M. l'abbé F. Nau. A representative selection of extracts has been given to English readers in J. F. Bethune-Baker's *Nestorius and his Teaching* (Cambridge, 1908), chapter ii. of which describes the ms. and its accounts.

NET. A fabric of thread, cord or wire, the intersections of which are knotted so as to form a mesh. The art of netting is intimately related to weaving, knitting, plaiting and lace-making, from all of which, however, it is distinguished by the knotting of the intersections of the cord. It is one of the most ancient and universal of arts, having been practised among the most primitive tribes, to whom the net is of great importance in hunting and fishing. Net is a common Teut. word, of which the origin is unknown; it is not to be connected with "knit" or "knot." The term "net," *i.e.*, remaining after all deductions, charges, etc., have been made, as in "net profit," is a variant of "neat," tidy, clean, Lat. *nitidus*, shining. Net-making, as a modern industry, is principally concerned with the manufacture of the numerous forms of net used in fisheries, but netting is also largely employed for many other purposes, as for the temporary division of fields, for protecting fruit in gardens, for screens and other furniture purposes, for bags, appliances used in various games, etc. Since the early part of the 19th century numerous machines have been invented for netting, and several of these have attained commercial success. Fishing nets were formerly made principally from hemp fibre —technically called "twine."

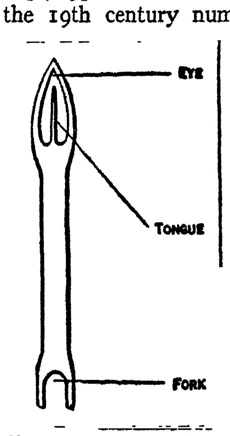

FIG. 1.—NEEDLE USED IN NET-MAKING

The forms of fishing nets vary according to the manner in which they are intended to act. This is either by entangling the fish in their complicated folds, as in the trammel; receiving them into pockets, as in the trawl; suspending them by the body in the meshes, as in the mackerel-net; imprisoning them within their labyrinth-like chambers, as in the stake-net; or drawing them to shore, as in the seine. The parts of a net are the head or upper margin, along which the corks are strung upon a rope called the head-rope; the foot is the opposite or lower margin, which carries the foot-rope, on which in many cases leaden plummets are made fast. The meshes are the squares composing the net. The width of a net is expressed by the term "over"; *e.g.*, a day-net is three fathoms long and one over or wide. The lever is the first row of a net. There are also accrues, false meshes or quarterings, which are loops inserted in any given row, by which the number of meshes is increased. To bread or breathe a net is to make a net.

[1]Syriac, *tēgūrtā*, lit. "merchandise." The Greek word may have been ἐμπορίον. Nothing is certainly known of any such Heraclides.

Hand Netting.—The tools used in hand netting are the needle, an instrument for holding and netting the material; it is made with an eye *E*, a tongue *T* and a fork *F* (fig. 1). The twine is wound on it by being passed alternately between the fork and round the tongue, so that the turns of the string lie parallel to the length of the needle, and are kept on by the tongue and fork. A spool, or mesh pin, is a piece of round or flat wood on which the loops are formed, the perimeter of the spool determining the size of the loops. Each loop contains two sides of the square mesh; therefore, supposing that it be required to make a mesh one inch square—

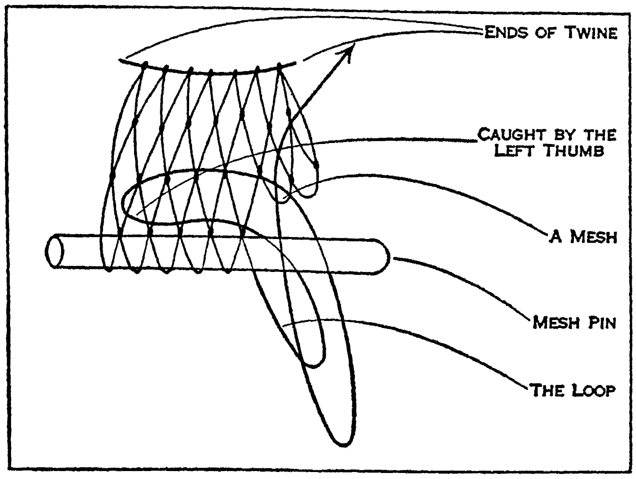

FIG. 2.—DIAGRAM SHOWING COURSE OF TWINE IN FORMING A FISHERMAN'S KNOT IN NETMAKING

that is, measuring one inch from knot to knot—a spool two inches in circumference must be used. Large meshes may be formed by giving the twine two or more turns round the spool, as occasion may require; or the spool may be made flat and of a sufficient width. The method of making the hand knot, known as the fisherman's knot, is more easily acquired by example than described in writing. Fig. 2 shows the course of the twine in forming a single knot. From the last-formed knot the twine passes over the front of the mesh pin and is caught behind by the little finger of the left hand, forming the loop, thence it passes to the front and is caught by the left thumb, then through the loop and mesh as sketch indicates, after which the twine is released by the thumb and the knot is drawn taut. Fig. 3 is a bend knot used for uniting two ends of twine.

Machine Netting.—In 1778 a netting machine was patented by William Horton, William Ross, Thomas Davies and John Golby. In 1802 the French government offered a reward of 10,000 fr. to the person who would invent an automatic machine for netmaking. Joseph Jacquard submitted a model of a machine which was brought under the notice of Napoleon I and Lazare Carnot, and he was summoned to Paris by the emperor, who asked—"Are you the man who pretends to do what God Almighty cannot—tie a knot in a stretched string?" Jacquard's model, which is incomplete, was deposited in the Conservatoire des Arts et Métiers; it was awarded a prize, and he himself received an appointment in the conservatoire, where he perfected his famous attachment to the common loom. In the United Kingdom, the first to succeed in inventing an efficient machine and in establishing the industry of machine netmaking was James Paterson of Musselburgh. Paterson, originally a cooper, served in the army through the Peninsular War, and was discharged after the battle of Waterloo. He established a net factory in Musselburgh about 1820; but the early form of machine was imperfect, the knots it formed slipped readily and, there being much prejudice against machine nets, the demand was small. Walter Ritchie, native of Musselburgh, devised a method for forming the ordinary hand knot on the machine nets, and the machine, patented in July 1835, became the foundation of an extensive and flourishing industry. The Paterson machine is very complex. It consists of an arrangement of hooks, needles and sinkers, one of each being required for every mesh in the breadth being made. The needles hold the meshes, while the hooks seize the lower part of each and twist it into a loop. Through the series of loops so formed a steel wire is shot, carrying with it twine for the next range of loops. This twine the sinkers successively catch and depress sufficiently to form the two sides and loop of the next mesh to be formed. The knot formed by threading the loops is now tightened up, the last-formed mesh is freed from the sinkers and transferred to the hooks and the process of looping, threading and knotting thus continues.

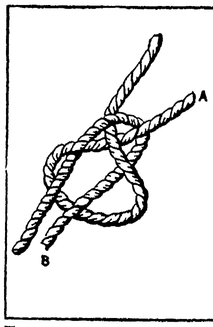

FIG. 3.—A BEND KNOT USED TO JOIN TWO ENDS, A AND B

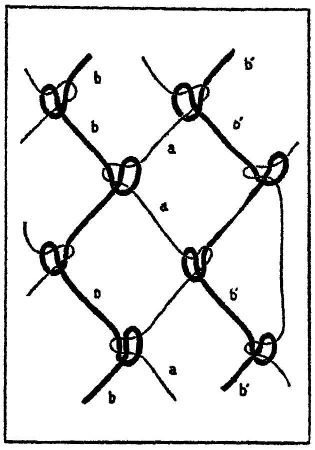

FIG. 4.—BAUDOUIN AND JOUANNIN'S NET LOOM, WHERE THE A SERIES IS DRAWN INTO LOOPS, OVER AND THROUGH WHICH THE B SERIES PASSES

Another form of net loom, working on a principle distinct from that of Paterson, was invented and patented in France by Onésiphore Pecqueur in 1840, and again in France and in Great Britain in 1849. This was improved by many subsequent inventors; especially by Baudouin and Jouannin.

Net Manufacture in the United States.—The manufacture of nets for the fisheries in the United States dates back to about 1844, being initiated by a manufacturer of cotton yarns at Canton, Mass. The popularity with which the first experimental cotton twines were received led the manufacturer to devote his whole time to their manufacture and improvement. In 1858 the first netting machine in the United States was seen. The limitations of this machine led to the development of new inventions, particularly those designed for handling heavy twines.

In view of the wholly inadequate supply of domestic flax and since but little of it is suitable for the manufacture of netting, domestic manufacturers are dependent upon imports for their raw materials. The use of cotton in the making of nets increased until the quantities used exceeded those for linen. Manilla is used by the domestic manufacturers in the making of trawls or other bag nets.

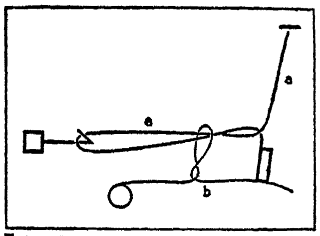

FIG. 5.—DIAGRAM SHOWING THE CONTINUATION OF THE PROCESS

Fishery apparatus employed in the fisheries of the United States and Alaska represents a large portion of the capital investment, a large part of which includes nets, nettings and lines, chiefly cotton, flax and hemp. Much of this material lasts but two years at best, so that the annual investment in new netting each year is an important factor in the fisheries.

NETHERLANDS. The Netherlands first became known to the Romans through the campaigns of Julius Caesar. He found the country peopled partly by tribes of Celtic (Gallic) stock, partly by tribes of Germanic, the river Rhine forming roughly the line of demarcation between the races. The Gallic tribes bore the general appellation of Belgae, and among these the Nervii, inhabiting the district between the Scheldt and the Sambre, were at the date of Caesar's invasion, 57 B.C., the most warlike and important. To the north of the Meuse and, more particularly, in the low-lying ground enclosed between the Waal and the Rhine (*insula Batavorum*) lived the Batavi. Beyond these were found the Frisians (*q.v.*), who gave their name to the territory between the Rhine and the Ems.

Julius Caesar, after a severe struggle with the Nervii and their confederates, was successful in bringing the Belgic tribes into

subjection to Rome. Under Augustus (15 B.C.), the conquered territory was formed into an imperial province, Gallia Belgica, and the frontier was strongly fortified. The Batavi were first brought under Roman rule in the governorship of Drusus (13 B.C.). They were not incorporated in the empire, but were ranked as allies. In 69 they revolted under a native leader, known only under his Roman name of Julius Civilis. After the rising, they returned to their position of *socii*. Their land became a recruiting ground for the Roman armies and they were henceforth faithful in their steady allegiance to Rome.

When at the end of the 3rd century the Franks (*q.v.*) began to swarm over the Rhine into the Roman lands, the names of the old tribes had disappeared. The branch of the Franks—who were a confederacy, not a people—that gradually overspread Gallia Belgica bore the name of Salii, from their position on the river Saale. In the days of their great king Clovis (481–511) they were in possession of the whole of the southern and central Netherlands.

The conversion of the Franks tended to facilitate fusion between them and the Gallo-Roman population and to accentuate the enmity between the Franks and their heathen neighbours, the Frisians in the northern and western strip of the coastal region and the Saxons in the eastern part of the country. In the south of the Netherlands bishoprics were set up at Cambrai, Tournai, Arras, Thérouanne and Liège. In the north, however, progress was much slower and success was the result as much of the arms of the Carolingian mayors of the palace and kings, as it was of the efforts of the missionaries Willibrord and Boniface. In 695 the bishopric of Utrecht was founded by Pippin II, and the Anglo-Saxon missionary Willibrord became the first archbishop among the Frisians. In the two following centuries the Frisians and Saxons, after an often severe struggle, finally surrendered to the authority of the Frankish empire and embraced Christianity.

The Duchy of Lower Lorraine.—The Verdun treaty (843) assigned the central part of the empire to the emperor Lothair, separating the kingdom of East Francia (the later Germany) from West Francia (the later France). This middle kingdom included the whole of the later Netherlands with the exception of the portion on the left bank of the Scheldt, which river was made the boundary of West Francia. On the death of the emperor in 855 his second son Lothair (825–869) received the northern part of his father's domain, known as Lotharii Regnum, corrupted later into Lotharingia and Lorraine. Lothair had no heir, and in 870 by the treaty of Merssen his territory was divided between the kings of East and West Francia. In 880 East Francia acquired the whole; from 912 to 924 it formed part of West Francia. In 925 Lorraine passed in the reign of Henry the Fowler under German overlordship. Henry's son, Otto the Great, placed it in 954 in the hands of his able brother, Bruno, archbishop of Cologne, for pacification. Bruno, who kept for himself the title of archduke, divided the territory into the two duchies of Upper and Lower Lorraine. Godfrey of Verdun was invested by him with the government of Lower Lorraine. The history of the Netherlands from that time forward—with the exception of Flanders, which continued to be a fief of the French kings—is the history of the various feudal states into which the duchy of Lower Lorraine was gradually broken up. (*See* BRABANT; FLANDERS; GELDERLAND; HOLLAND; LIÈGE; LIMBURG; LORRAINE; UTRECHT.)

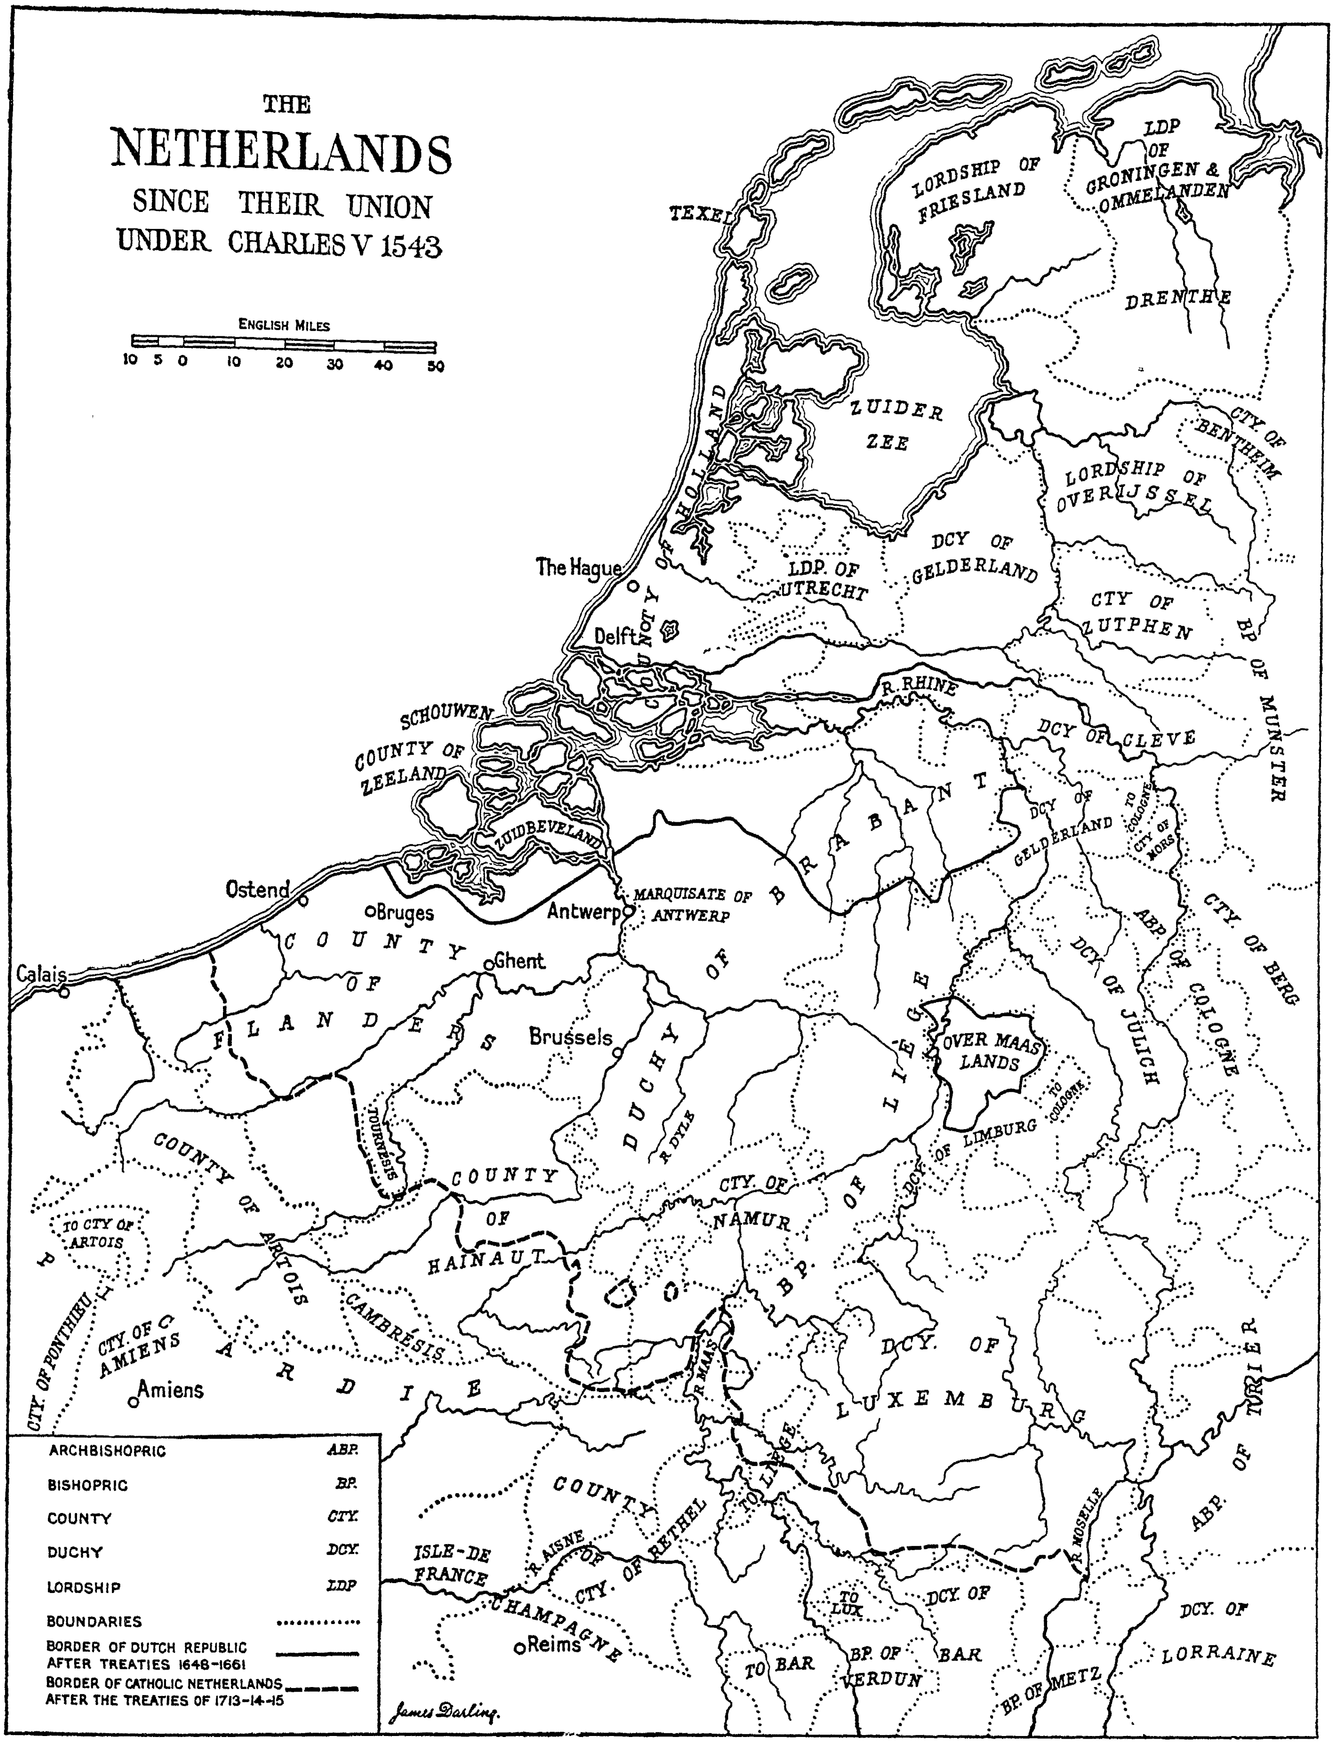
The development of feudalism in the Netherlands was largely caused by the necessity of protecting the land against the Scandinavian attacks of the 9th and 10th centuries. For a time near the middle of the 9th century the Northmen were masters of all Holland and Friesland, though they never established permanent settlements there. The remoteness of the Netherlands from the centres of either French or imperial power threw the burden of defense upon local magnates, and a great increase in their authority was the inevitable consequence. Long before the end of the 11th century the system of feudal states had been firmly established in the Netherlands.

The Rise of the Cities.—Little is known about the Netherlands towns before the 11th century. The earliest charters date from that period. The charters were of the nature of a treaty between the city and its feudal lord, and they differed much in character according to the importance of the place and the pressure that the citizens were able to put upon their lord. The extent of the rights which the charter conceded determined whether the town was a free town or a commune. In the case of a commune the concessions included generally the right of inheritance, justice, taxation, use of wood, water, etc. The lord's representative, entitled justiciary (*schout*) or bailiff (*baljuw*), presided over the administration of justice and took command of the town levies in war. The *gemeente*—consisting only of those bound by the communal oath for mutual help and defense—elected their own magistrates. These electors were often a small proportion of the whole body of inhabitants; sometimes a few influential families alone had the right, and it became hereditary. The magistrates bore the name of *scabini*, and at their head was the seigneurial official—the *schout* or *baljuw*.

The most powerful and flourishing of all were those of Flanders—Ghent, Bruges and Ypres. In the 13th century those towns had become the seat of large industrial populations employed in the weaving of cloth with its dependent industries and closely bound up by trade interests with England, whence they obtained the wool for their looms. Bruges, at that time connected with the sea by the river Zwijn, was the central mart and exchange of the world's commerce. In those Flemish cities the early oligarchic form of municipal government in the long run gave way to a more democratic one. The great mass of the townsmen, organized in trade guilds—weavers, fullers, dyers, smiths, leather-workers, brewers, butchers, bakers and others, of which by far the most powerful was that of the weavers—as soon as they became conscious of their strength rebelled against the exclusive privileges of the patricians and succeeded in ousting them from power. The patricians relied upon the support of the French crown, but the battle of Courtrai (battle of the Golden Spurs, 1302), in which the handicraftsmen laid low the chivalry of France, secured the triumph of the democracy. The power of the Flemish cities rose to its height during the ascendancy of Jacob van Artevelde (*c.* 1290–1345), the famous citizen-statesman of Ghent, but after his downfall the mutual jealousies of the cities undermined their strength, and with the crushing defeat of Roosebeke (1382), in which Jacob's son Philip van Artevelde perished, the political greatness of the municipalities entered upon its decline.

In Brabant—Antwerp, Louvain, Brussels, Malines (Mechelen)—and in the episcopal territory of Liège—Liège, Huy, Dinant—there was a more feeble repetition of the Flemish conditions. Flourishing communities were likewise to be found in Hainaut, Namur, Cambrai and the other southern districts of the Netherlands, but nowhere else the vigorous independence of Ghent, Bruges and Ypres, nor the splendour of their civic life. In the north also the 13th century was rich in municipal charters. Dordrecht, Leyden, Haarlem, Delft, Vlaardigen, Rotterdam in Holland and Middelburg and Zierikzee in Zeeland repeated with modifications the characteristics of the communes of Flanders and Brabant. But the growth and development of the northern communal movement, though strong and instinct with life, was slower and less tempestuous than the Flemish. In the bishopric of Utrecht, in Gelderland and in Friesland the privileges accorded to Utrecht, Groningen, Zutphen, Stavoren, Leeuwarden, followed on the model rather of those of the Rhenish "free cities" than of the Franco-Flemish commune.

The Dukes of Burgundy.—It was at that time that Flanders and gradually the other feudal states of the Netherlands, by marriage, purchase or force, fell under the dominion of the house of Burgundy. The foundation of the Burgundian rule in the Netherlands was laid by the succession of Philip the Bold to the counties of Flanders and Artois in 1384 in right of his wife, Margaret of Mâle. In 1406 Antony, Philip's second son (killed at Agincourt, 1415), became duke of Brabant by bequest of his maternal great-aunt Joan. The consolidation of the Burgundian power was effected by Philip the Good, grandson of Philip the Bold, in his long and successful reign of 48 years (1419–67). He inherited Flanders and Artois, purchased the county of Namur (1427) and compelled his cousin Jacqueline, the heiress of Holland, Zeeland, Hainaut and Friesland, to surrender her possessions to him in 1433,



FROM POOLE, "HISTORICAL ATLAS" (CLARENDON PRESS, OXFORD)

after his having become in 1428, by the Reconciliation of Delft, regent of Jacqueline's counties. On the death, in 1430, of his cousin Philip, duke of Brabant (Antony's younger son), he took possession of Brabant and Limburg; the duchy of Luxembourg he acquired by purchase in 1443. He made his bastard son David bishop of Utrecht, and from 1456 onward that see continued under Burgundian influence. The duchy of Gelderland too came temporarily under the Burgundian power during the reign of Charles the Bold.

This extension of the Burgundian dominion implied the establishment of a strong monarchical authority. The dukes had united under their sway a number of provinces with different histories, institutions and languages, and their aim was to centralize their government. The nobility and clergy were on the side of the ducal authority; its opponents were the municipalities, especially those of Flanders. Their strength had been seriously weakened by the overthrow of Roosebeke, but Philip the Good on his accession found them once more advancing rapidly in power and prosperity. He was quite aware that the industrial wealth of the great Flemish communes was financially the mainstay of his power, but their very prosperity made them the chief obstacle of his schemes of unifying into a solid dominion the loose aggregate of states over which he was the ruler. On this matter Philip would brook no opposition: Bruges was forced after strenuous resistance to submit to the loss of its most cherished privileges in 1438, and the revolt of Ghent was quenched in the "red sea" of Gavre in 1453. The splendour and luxury of the court of Philip surpassed that of any contemporary sovereign. A permanent memorial of it remains in the famous Order of the Golden Fleece, which was instituted by the duke at Bruges in 1430 on the occasion of his marriage with Isabella, daughter of John I of Portugal.

(C. D. J. B.; X.)

Before the accession in 1467 of Charles the Bold, Philip the Good's only son, two important steps had been taken toward unification. The first was the appointment of a grand council with supreme judicial and financial functions, whose seat was finally fixed at Malines in 1473; the other, the summoning of deputies of all the provincial "estates" of the Netherlands to a states-general at Brussels in 1465. At first all went well with Charles. By his ruthless suppression of revolts at Dinant and Liège he made his authority undisputed throughout the Netherlands. His campaigns against the French king Louis XI were conducted with success. His creation of a formidable standing army, the first of its kind in that age of transition from feudal conditions, gave to the Burgundian power all the outward semblance of stability and permanence. But Charles, though a brave soldier and good military organizer, was neither a capable statesman nor a skilful general. At the very height of his power all his schemes of aggrandisement came to sudden ruin through a succession of disastrous defeats at the hands of the Swiss. At Nancy, on Jan. 5, 1477, Charles was himself among the slain, leaving his only daughter, Mary (*q.v.*) of Burgundy, then in her 20th year, sole heiress to his possessions.

Mary of Burgundy.—The catastrophe of Nancy threatened the loosely knit Burgundian dominion with dissolution. Louis XI claimed the reversion of the French fiefs and seized Burgundy, Franche Comté and Artois. But the Netherland provinces, though not loving the Burgundian dynasty, had no desire to have a French master. Deputies representing Flanders, Brabant, Hainaut and Holland met at Ghent, where Mary was detained almost as a prisoner, and compelled her (Feb. 10, 1477) to sign the "Great Privilege." This charter provided that no war could be declared nor marriage concluded nor taxes raised by the sovereign without the assent of the estates, that natives were alone eligible for high office and that the national language should be used in public documents. The central court of justice at Malines was abolished, but the grand council was reorganized and made thoroughly representative. The Great Privilege was supplemented by provincial charters, the Flemish Privilege (Feb. 10), the Great Privilege of Holland and Zeeland (Feb. 17), the Great Privilege of Namur and the *Joyeuse Entrée* of Brabant, both in May, thus curtailing the sovereign's power of interference with local liberties. On these conditions Mary obtained the hearty support of the estates against France. Her marriage four months later to Maximilian of Austria was the beginning of the long domination of the house of Habsburg.

The Archduke Philip.—When Mary died from the effects of a fall from her horse (March 1482), Maximilian became regent (*mambourg*) for their son, Philip. The peace of Arras with France (March 1483) freed him to deal with the discords in the Netherland provinces, and more especially with the turbulent opposition in the Flemish cities. With the submission of Ghent (June 1485) the contest was decided in favour of Maximilian, who in 1494, on his election as emperor, was able to hand over the country to his son, Philip, in a comparatively tranquil and secure state. Philip was 15 years of age, and his accession was welcomed by the Netherlanders, with whom Maximilian had never been popular. Gelderland, however, which had revolted after Nancy, had Charles of Egmont for its duke, and the two bishoprics of Liège and Utrecht were no longer subject to Burgundian authority. In 1496 Philip married Joan of Aragon, who in 1500 became heiress apparent to Castile and Aragon. She gave birth at Ghent to a son, afterward the emperor Charles V. On the death of Queen Isabella, Philip and Joan succeeded to the crown of Castile and took up their residence in their new kingdom (Jan. 1506). A few months later Philip unexpectedly died at Burgos (Sept. 25). His Burgundian lands passed without opposition to his son Charles, then six years of age. (X.)

Charles V.—The emperor Maximilian, who was regent during the minority of his grandson, appointed his daughter, Margaret, widow of Philibert, duke of Savoy, as governor general, an office which she held with varying success for eight years. In 1515, at the instance of the states-general, the 15-year-old Charles was suddenly declared of age. Born and brought up in the Netherlands, he was personally popular there. The country was prosperous. The period of Burgundian rule had given it not only common constitutional organs but the unifying sentiment of a common loyalty. Unfortunately, however, the accession of Charles brought the Netherlands into the huge and incongruous collection of states which the wars and marriages of the Habsburgs had heaped together. By the time he was 20 Charles was king of Aragon and Castile, with their Italian and American possessions, head of the house of Austria and emperor. This meant first that he had to spend most of his life in his other dominions, leaving the Netherlands again to his aunt, Margaret, and after her death (Nov. 27, 1530) to his sister Mary, the widow of Louis II of Hungary. It meant also that he had to make large financial demands on these rich provinces for the purposes of his many wars. Opposition to the taxes led at last to one serious collision: the great city of Ghent resisted, and on Feb. 14, 1540, Charles entered it as a conqueror and humbled it by annulling its liberties and exacting a heavy fine. Another difficulty was the rapid growth of Protestantism. A series of severe edicts against heresy was issued and enforced; but though many heretics were executed, every form of Protestant belief continued to make converts. None of these dangers, however, came as yet to a head. The rule of Charles and the "governesses" was on the whole moderate and successful. He rounded off the dominions by the purchase and subjugation of Friesland (1524), the annexation of the lands of the bishops of Utrecht (1528) and the defeat of an opponent who tried to establish himself in the duchy of Gelderland (1538). By 1543 he ruled over the 17 provinces which are usually meant by the name Netherlands, though oddly enough there are several different ways of enumerating them. It is due not to any geographical or racial factors but simply to the subsequent course of political history that there was no further expansion of the frontiers to the east or south. In the task of welding these provinces together by constitutional links Charles made some headway, but not much. He made the rules of hereditary succession the same for all of them, so that they should never be divided among different heirs. He carried out a nominal, but in the result quite ineffective, incorporation of the provinces in the Holy Roman empire. He governed the provinces by executive councils of the type usual in the monarchies of the period and, in addition to the provincial estates, he liked to summon, when he needed grants of money, states-general

(produced in London in 1902). Miss Nethersole worked during World War I on various Red Cross organizations. She was the founder in 1917 of the People's League of Health. In 1936 she was created C.B.E. She died at Bournemouth, Eng., on Jan. 9, 1951.

NETHINIM, the name given to the members of a class of assistants in the service of the temple of Jerusalem. In the Old Testament they are specially mentioned, and thus designated, only by the compiler of Chronicles-Ezra-Nehemiah (3rd century B.C.). The name means "given" or "dedicated" (*i.e.,* to the temple); *cf.* Num. iii, 9; viii, 19, where the same term is applied to the Levites. In I Esdras and Josephus they are called ἱερόδουλοι, as are also the Levites in I Esdras i, 3. In the census lists compiled by the Chronicler, where a complete classification is desired, we find the order: Levites, singers, porters, Nethinim; *e.g.,* in Ezra ii. Of these classes, the first three are of equal rank; the singers and porters are Levites (I Chr. ix, 2; Neh. xi, 3, 15–18; xiii, 22, etc.), though sometimes expressly distinguished from them, when the special duties of the several orders are thought of (II Chr. xxxv, 15; Ezra ii, 70, etc.). In the time of the Chronicler the Nethinim were free men and members of the Israelite community. They were registered by families and were exempt from taxation. Like the priests and Levites they served in rotation, being assigned to a certain portion of Jerusalem (Ophel), and also to neighbouring Levitical cities or villages. In Neh. x, 29 *et seq.* they join in the solemn covenant, promising among other things not to intermarry with "the peoples of the land."

It is generally supposed, and not without good reason, that the Nethinim had their origin in a class of foreign menials (slaves) employed in the temple. In the time of the Chronicler it was customary to describe the Nethinim as "those given by David for the Levitical service" (Ezra viii, 20), and similar to this is the designation of one portion of them as the "children of Solomon's servants" (Ezra ii, 55; Neh. vii, 57; xi, 3). (C. C. T.)

NETLEY, a village in Hampshire, Eng., 3 mi. S.E. of Southampton, and on a branch of the Southern Region railway. A Cistercian abbey was founded in 1237 by Henry III; its ruins include a great part of the cruciform church, abbot's house, chapter house and domestic buildings. The style is Early English and Decorated The gatehouse was transformed into a fort in the time of Henry VIII. Netley hospital for wounded soldiers, built after the Crimean War, is one of the principal military hospitals in Great Britain.

NETSCHER, GASPAR (1639–1684), German portrait and genre painter, was born at Heidelberg in 1639. As a boy he was adopted by a physician named Tullekens, who placed him under an artist named De Koster, and afterward under Gerard ter Borch. He then went to Italy, but finally settled at Bordeaux, where he made a living by painting the small cabinet pictures which are now so highly valued because of their exquisite finish. After moving to The Hague, he turned his attention to portrait painting, which proved more lucrative, and he was soon able to gratify his own taste by depicting the musical and conversational pieces which fully displayed his genius. These possess easy yet delicate pencilling, brilliant and correct colouring and pleasing light and shade, although frequently their refinement passes into weakness. His sons, Constantyn (1668–1722) and Theodorus (1661–1732), were also painters, after their father's style but inferior in merit.

NETTLE, the common name for the plants of the botanical genus *Urtica,* which gives its name to the family Urticaceae. It contains about 30 species found in the temperate parts of both hemispheres. They are herbs covered with stinging hairs, and with very small, greenish, unisexual flowers on the same or on different plants. The stinging hairs consist of an elongated tubular cell the extremity of which is finely pointed. By this point the hair penetrates the skin, breaks off and its contents pass out. The fluid contains formic acid and has a temporary irritant effect. Nettle tops, or the very young shoots of the nettle, may be used as a vegetable like spinach; but from the abundance of crystals (*cystoliths*) they contain they are apt to be gritty. The fibre furnished by the stems of several species is used for cordage or papermaking. Three species of nettle are wild in the British Isles: the common or great nettle (*U. dioica*), which is a hairy perennial with staminate and pistillate flowers in distinct plants; the small nettle (*U. urens*), which is annual and, except for the stinging hairs, glabrous, and has staminate and pistillate flowers in the same panicle; and the Roman nettle (*U. pilulifera*), an annual with the pistillate flowers in rounded heads, which occurs in waste places in the east of England, chiefly near the sea—the most virulent British species.

In North America, where the small nettle has become naturalized locally and the great nettle from Newfoundland to Colorado and southward, there are several native nettles. Among these are the tall nettle (*U. gracilis*), found across the continent northward; the weak nettle (*U. chamaedrioides*), of the southeastern states; the hoary nettle (*U. holosericea*), found from Idaho and Washington to Lower California. Closely allied are the wood nettle (*Laportea canadensis*) of the eastern United States and the western nettle (*Hesperocnide tenella*) of California, both of which also produce stinging hairs.

NETTLE RASH: *see* URTICARIA.

NETTLESHIP, HENRY (1839–1893), English classical scholar, was born at Kettering on May 5, 1839. He was educated at Lancing, Durham and Charterhouse schools and Corpus Christi college, Oxford. He was a master at Harrow and later professor of Latin at Oxford, where he died on July 10, 1893. He specialized in the study of Virgil. After John Conington's death in 1869, he saw his edition of Virgil through the press, and revised and corrected subsequent editions. In 1887 he published some of the results of 12 years' labour on a Latin lexicon (never completed) in a volume entitled *Contributions to Latin Lexicography.* The second series of his *Lectures and Essays,* published in 1895 and edited by F. Haverfield, contains a memoir by Mrs. M. Nettleship, with full bibliography.

NETTLESHIP, RICHARD LEWIS (1846–1892), English philosopher, was born on Dec. 17, 1846, and educated at Uppingham and Balliol college, Oxford. He won the Hertford scholarship, the Ireland, the Gaisford Greek verse prize, a Craven scholarship and the Arnold prize, but took only a second class in Litterae Humaniores. He became fellow and tutor of his college and succeeded to the work of T. H. Green, whose writings he edited with a memoir (1880). His philosophy was idealistic and Hegelian. He died on Aug. 25, 1892, from the effects of exposure on Mont Blanc, and was buried at Chamonix.

Besides his edition of Green's works, Nettleship published *The Theory of Education in Plato's Republic* (1880). His *Philosophical Lectures and Remains* were edited by A. C. Bradley (1897; 2nd ed., 1901), the *Lectures on the Republic of Plato* being printed separately in 1898 (2nd ed., 1901).

NETTLE TREE, the name applied to certain trees of the genus *Celtis,* belonging to the elm family (Ulmaceae). The best-known species have usually obliquely ovate, or lanceolate leaves, serrate at the edge and marked by three prominent nerves. The flowers are inconspicuous, with a four- or five-parted perianth, as many stamens, a hairy disk and a one-celled ovary with a two-parted style. The fruit is succulent, drupelike, a character which serves to separate the genus alike from the nettles and the elms, to both of which it is allied.

C. australis is a common tree, both wild and planted, throughout the Mediterranean region extending to Afghanistan and the Himalaya; it is also cultivated in Great Britain. It is a rapidly growing tree, from 30 to 40 ft. high, with a remarkably sweet fruit, recalling a small black cherry, and was one of the plants to which the term "lotus" was applied by Dioscorides and the older authors. The wood, which is compact and hard, is used for a variety of purposes. *C. occidentalis,* a North American species, is the hackberry (*q.v.*).

NEUBER, FRIEDERIKE KAROLINE (1697–1760), German actress, was born in Reichenbach, Saxony, on March 9, 1697. She and her husband acted in travelling theatrical companies until they formed their own, in 1727, at Leipzig. In 1748 she introduced Gotthold Lessing's first play to the German public. She died in poverty in Laubegast, Saxony, 1760.

NEU-BRANDENBURG, a town of Germany, in Mecklenburg, on the Tollense See at the mouth of the Tollense, 58 mi. W.N.W. of Stettin by rail. Pop. (1939) 22,275. Neu-Brandenburg was founded in 1248, and has belonged to Mecklenburg since 1292. It is partly surrounded with walls, and possesses four old Gothic gates, dating from about 1300. The principal buildings are the Marienkirche, a 13th-century Gothic building, the former grand ducal palace and the palace of Belvedere.

NEUBREISACH: *see* Neuf-Brisach.

NEUBURG, a town in the *Land* of Bavaria, situated on the Danube 12 mi. W. of Ingolstadt by rail. Pop. (1933) 7,670. Neuburg was originally an episcopal see. In the 10th century it passed to the counts of Scheyern, and through them to Bavaria, being ceded to the Rhenish Palatinate in 1507. From 1557 to 1742 it was the capital of a small principality ruled by a cadet branch of the family of the elector palatine of the Rhine. In 1742 it was united again with the Rhenish Palatinate, with which it passed in 1777 to Bavaria. Its most important building is the old residence of its princes, in 16th-century Renaissance style.

NEUCHÂTEL (Ger. Neuenburg), one of the cantons of western Switzerland, on the frontier toward France. It is the only Swiss canton that is situated entirely in the Jura, of which it occupies the central portion (its loftiest summit is Mont Racine, 4,731 ft., in the Tête de Rang range). The canton has a total area of 305 sq.mi., of which more than three-quarters is reckoned "productive." It consists, for the most part, of the longitudinal ridges and valleys characteristic of the Jura, while its drainage is very unequally divided between the Thièle or Zihl, and the Doubs, which forms part of the northwest boundary of the canton, and receives only the streams flowing from the Le Locle and La Chaux de Fonds valley. Three regions make up the territory. That stretching along the shore of the lake is called Le Vignoble (from its vineyards) and extends from about 1,500 ft. to 2,300 ft. above sea level. An intermediate region is named Les Vallées, for it consists of the two principal valleys of the canton (the Val de Ruz, watered by the Seyon, and the Val de Travers, watered by the Areuse), which lie at a height of about 2,300 ft. to 3,000 ft. above sea level. The highest region is known as Les Montagnes, and is mainly composed of the long valley in which stand the industrial centres of La Chaux de Fonds (*q.v.*) and Le Locle (*q.v.*), to which must be added those of La Sagne, Les Ponts and Les Verrières, the elevation of these upland valleys varying from 3,000 ft. to 3,445 ft. The canton is well supplied with railways, the direct line from Berne past Kerzers (Chiètres), Neuchâtel, the Val de Travers and Les Verrières to Pontarlier for Paris passing through it, while La Chaux de Fonds is connected by a line past Le Locle with Morteau in France. Other lines join the capital, Neuchâtel, to La Chaux de Fonds, as well as to Yverdon at the southwest extremity of the lake, and to St. Blaise at its northeast end.

The population declined in the 20th century: (1920) 131,349, (1930) 124,324; (1941) 117,994; (1950) 128,152. In 1930, 105,516 were French-speaking, 15,248 German-speaking and 2,888 Italian-speaking, while 100,548 were Protestants, 13,720 Roman Catholics and 436 Jews. There are three "established and state-endowed" churches, the National Evangelical, the Roman Catholic and the Old Catholic (this sect in La Chaux de Fonds only), while the pastors of the Free Evangelical Church and of the Jews (mostly in La Chaux de Fonds) receive special privileges.

Besides the capital, Neuchâtel (*q.v.*), the chief towns are La Chaux de Fonds, Le Locle and Fleurier, the latter the principal village in the Val de Travers.

The most valuable mineral product is asphalt, of which there is a large and rich deposit in the Val de Travers. The wine of the Vignoble region is plentiful. Absinthe is manufactured in the Val de Travers.

The most characteristic industry is that of watchmaking, which is chiefly carried on (since the early 18th century) in the highland valleys of La Chaux de Fonds and of Le Locle, as well as at Fleurier in the Val de Travers.

The canton is divided into 6 administrative districts, which comprise 63 communes.

The legislature or *grand conseil* consists of members elected in the proportion of population and holds office for three years.

The canton in 1941 sent six representatives (elected for a term of four years) to the *nationalrat,* lower chamber of the national parliament. It sends two members to the upper chamber.

History.—We first hear of the *novum castellum* (Neuchâtel) in the will (1011) of Rudolf III, the last king of Burgundy, on whose death (1032) that kingdom reverted to the empire. About 1034 the emperor Conrad II gave this castle to the lord of several neighbouring fiefs, his successors establishing themselves permanently there in the 12th century and taking the title of count. In 1288 the reigning count resigned his domains to the emperor Rudolf, who gave them to the lord of Châlon-sur-Saône, by whom they were restored to the count of Neuchâtel on his doing homage for them. This act decided the future history of Neuchâtel, for in 1393 the house of Châlon succeeded to the principality of Orange by virtue of a marriage contracted in 1388. The counts gradually increased their dominions, so that by 1373 they held practically all the present canton, with the exception of the lordship of Valangin which was held by a cadet line of the house till bought in 1592. In 1532 the title of prince was taken by the reigning count, while by the treaty of Westphalia (1648) the principality became sovereign and independent of the empire. In 1707 the Longueville house of Neuchâtel also became extinct, and a great struggle arose as to the succession. Finally the parliament (states) of Neuchâtel decided in favour of Frederic I, the first king of Prussia. The nominal rule of the Prussian king (for the country enjoyed practical independence) lasted till 1857, with a brief interval from 1806 to 1814, when the principality was held by Marshal P. A. Berthier, by virtue of a grant from Napoleon. In 1814 its admission into the Swiss confederation was proposed and was effected in 1815, the new canton being the only nonrepublican member, just as the hereditary rulers of Neuchâtel were the last to maintain their position in Switzerland. This anomaly led in 1848 to the establishment (attempted in 1831) of a republican form of government, brought about by a peaceful revolution led by A. M. Piaget. A royalist attempt to regain power in 1856 was defeated, and finally, after long negotiations, the king of Prussia renounced his claims to sovereignty, though retaining the right to bear the title of "prince of Neuchâtel." Thus in 1857 Neuchâtel became a full republican member of the Swiss confederation.

NEUCHÂTEL, capital of the Swiss canton Neuchâtel, situated near the northeast corner of the lake of Neuchâtel. In 1950 it had 27,998 inhabitants, the greater portion of whom were French-speaking and Protestant, with a minority of German-speaking inhabitants and Roman Catholics, and a small number of Jews. It is the meeting point of several important railway lines. The older portion of the town is built on the steep slope of the Chaumont (3,855 ft.), and originally the waters of the lake bathed the foot of the slope. But the gradual growth of alluvial deposits, and later the artificial embankment of the shore of the lake, added much dry ground, and on that site the finest modern buildings were erected. The 16th-century castle and the 13th-century collegiate church of Notre Dame (now Protestant) stand close together, and were founded in the 12th century when the counts took up their permanent residence in the town, to which they granted a charter of liberties in 1214. Among the buildings on the quays are the Musée des Beaux Arts (modern Swiss paintings and various historical collections, including that

of Desor relating to the Lake Dwellings), the Gymnase (in which are also the museum of natural history, with the fine collections of Agassiz, and the town library), the university and the École de Commerce. The town owes much to the gifts of citizens.

NEUCHÂTEL, LAKE OF. The lakes of Neuchâtel, Bienne and Morat, connected by canals, are survivors of a former great lake of the lower Aar valley. It is the largest lake wholly in Switzerland. Its total area is 92½ sq.m. (36½ sq.m. are in the Canton of Neuchâtel over 33 sq.m. in Vaud, 20¾ sq.m. in Fribourg and in Berne 2 sq.m.). It is about 23½ m. long, from 3¾ to 5 m. wide, its greatest depth is 502 ft., while its surface is 1,427 ft. above sea level. The Thièle or Zihl river enters at its south-western end and issues from it at its north-eastern end, but it also receives the Areuse (N.W.), Seyon (N.W.) and the Broye (N.E.). On the south-eastern shore the picturesque and historic little town of Estavayer is the chief place. At the south-western extremity of the lake is Yverdon (the *Eburodunum* of the Romans and the residence of Pestalozzi, 1806–1825). Far more populated is the northwestern shore, where from southwest to northeast, we find Grandson, Cortaillod, Serrières and Neuchâtel itself. On the north shore is La Tène.

NEUENDORF: *see* NOWAWES.

NEUF-BRISACH or **NEUBREISACH,** a town of France in the department of Haut-Rhin on the Rhine-Rhone canal, 12 mi. E. from Colmar by the railway to Freiburg. Pop. (1936) 2,150. Neuf-Brisach is a garrisoned fortress town founded by Louis XIV in 1699 and fortified by Vauban. It was taken by the Germans on Nov. 10, 1870, and became French once more in 1918.

NEUFCHÂTEAU, a town of eastern France, in the department of Vosges at the confluence of the Meuse and the Mouzon, 49 mi. W.N.W. of Épinal by rail. Pop. (1936) 4,083. The town, which is said to occupy the site of the Roman *Neomagus,* belonged in the middle ages to the dukes of Lorraine, ruins of whose château are still to be seen. In 1641 it passed to France. The churches are those of St. Christopher (13th and 15th centuries) and St. Nicholas, the latter combining the Romanesque and Gothic styles and built above a Romanesque crypt.

NEUHOF, THEODORE STEPHEN, BARON VON (*c.* 1690–1756), German adventurer and for a short time nominal king of Corsica, was the son of a Westphalian nobleman and was born at Cologne. Educated at the court of France, he served first in the French army, and then in that of Sweden. Baron de Goertz, minister to Charles XII, realizing Neuhof's capacity for intrigue, sent him to England and Spain to negotiate with Cardinal Alberoni. He returned to Sweden and then went to Spain, where he was made colonel and married one of the queen's ladies-in-waiting. Deserting his wife soon afterwards he repaired to France and became mixed up in Law's financial affairs; then he wandered about Portugal, Holland and Italy, and at Genoa he made the acquaintance of some Corsican prisoners and exiles, whom he persuaded that he could free their country from Genoese tyranny if they made him king of the island. With their help and that of the bey of Tunis he landed in Corsica in March 1736, where the islanders, believing that he had the support of several of the powers, proclaimed him king. He assumed the style of Theodore I, issued edicts, instituted an order of knighthood and waged war on the Genoese, at first with some success. But he was eventually defeated, and civil broils soon broke out in the island; the Genoese having put a price on his head and published an account of his antecedents, he left Corsica in Nov. 1736, ostensibly for foreign assistance. He returned to the island in 1738, 1739 and 1743, but the combined Genoese and French forces drove him out. Arrested for debt in London he regained his freedom by mortgaging his "kingdom" of Corsica and subsisted on the charity of Horace Walpole and other friends until his death in London on Dec. 11, 1756.

See *Mémoires pour servir à l'histoire de la Corse,* by his son, Frederick, also an English translation, both published in London in 1768. In 1795 he published a new edition on *Description of Corsica with an account of its union to the crown of Great Britain. See* also Fitzgerald, *King Theodore of Corsica* (1890) and Le Glay, *Théodore de Corse* (1907).

NEUILLY, TREATY OF. The Bulgarian treaty was signed at Neuilly on Nov. 27 1919, and came into force on Aug. 9 1920. In the main it is the same as the Austrian treaty. But there were important differences in the military and naval clauses, and also in reference to reparation and finance.

The only serious territorial changes were to the west and south. The Serb-Croat-Slovene kingdom obtained several strategic ratifications. The two most important are that the Strumitsa salient in the extreme south-west has been flattened out, the western half being ceded to the Serbs; also, and more important, in the Nish-Pirot area the town of Tsaribrod has been taken from Bulgaria and a line drawn whereby an advance on Nish would be rendered more difficult. The frontier, however, confers no offensive advantage on the Serbs. A loss more serious in another sense is that to Greece of the district of Western Thrace, lying between Xanthi and the Maritsa river. This was ceded to Greece on her obtaining Eastern Thrace and Adrianople. Bulgaria, for ethnic reasons, received a slight extension of territory west of Adrianople. The expulsion of Greeks from Adrianople and East Thrace by the Turks did not, however, cause the Allies to change their minds about Western Thrace, which remains annexed to Greece and is denied to Bulgaria.

Bulgaria had always asserted claims to that part of Macedonia now in Serbian hands, and also to Eastern and Western Thrace. In the former area her ethnic pretensions are better founded than in the latter. But Serbian Macedonia is in the hands of a formidably armed and militarily strong nation. Greek Macedonia and Thrace are now populated by hundreds of thousands of Greek refugees from Asia, and contain over 80% of a purely Greek population. In population Bulgaria lost some 300,000 persons, of whom some are not Bulgars.

Part IV. The military, naval and air clauses have some special points. Bulgaria is allowed 20,000 regulars, 10,000 gendarmes and 3,000 frontier guards, or 33,000 in all. This number is insufficient to maintain order in a turbulent Balkan State, and the subsequent serious disturbances in Bulgaria are due directly to this fact. It is increased by the difficulty of applying the voluntary long-service system of 12 consecutive years to a nation of peasants. In an agricultural country it is practically impossible to get men to leave their farms for 12 years, and the army is always likely to be dangerously below strength, and the less regular formations dangerously above it. The naval clauses do not differ from those of the German or Austrian treaties. All Bulgaria's navy has now been destroyed, and she was left with four torpedo-boats, of which three were damaged, and six motor-boats, of which four were damaged.

Part V. (*Prisoners of War and Graves*) and

Part VI. (*Penalties*) are the same as in the Austrian treaty (*see* ST. GERMAIN, TREATY OF).

Part VII. (*Reparation.*) This contains the most novel and interesting feature of the treaty, and is, in fact, the only serious attempt to get reparation on to a business basis. It contained three features of great interest.

(*a*) Contrary to the practice in the German, Austrian and Hungarian treaties, there was no attempt made to seize or distribute the Bulgarian commercial fleet on the "ton-for-ton" or "class-for-class" principle.

(*b*) It fixed the amount to be paid at the lump sum of £90,000,000.

(*c*) It created a Reparation Commission consisting of French, British and Italian representatives with power to reduce this amount by a simple majority vote (not by unanimity as is the systematic rule), on the suggestion of the inter-allied Commission.

The general scope and powers of the Reparation Commission are drawn in such a manner as to control the finances of the country sufficiently to obtain reparation, without offensive interference. In the end, the Reparation Commission, after examining the question on the spot, has practically remitted three-quarters of the total of £90,000,000. The annual sum now required to meet the charges on the 550,000,000 gold francs of the debt is well within the capacity of the new Bulgarian State, and is being punctually paid. None of the remaining clauses of the Bulgarian treaty have any special features of interest or importance.

(*See* BULGARIA; PARIS, CONFERENCE OF; REPARATION, etc.).

NEUILLY-SUR-SEINE, a suburb of Paris 8 kilometres northwest from Notre Dame, in the department of Seine. It is situated between the fortifications and the Seine. Pop. (1936) 56,938. A castle at Neuilly, built by the count of Argenson in the 18th century, ultimately became the property and favourite residence of the duke of Orléans (Louis Philippe), the birthplace

of nearly all his children and the scene of the offer of the crown in 1830. The buildings were pillaged and burned by the mob in 1848. The park, which extended from the fortifications to the river, as well as the neighbouring park of Villiers (also belonging to the princes of Orleans), was broken up into building lots, and is occupied by many small middle-class houses and a few fine villas. The fine bridge, designed in the 18th century by Perronet, is noteworthy as the first level bridge constructed in France. The Galignani institution, founded by the brothers Galignani for aged book-sellers, printers and others, has accommodation for 100 residents. The manufactures include perfumery, chocolate, colours, varnish, automobiles, carpets; Neuilly is an engineering centre.

NEUMANN, FRANZ ERNST (1798–1895), German mineralogist, physicist and mathematician, was born at Joachimstal on Sept. 11, 1798. Neumann's earlier papers on crystallography led to his appointment as Privatdozent at Königsberg, where in 1828 he became extraordinary, and in 1829 ordinary professor of mineralogy and physics. In 1831, from a study of the specific heats of compounds, he formulated "Neumann's law" (that "the molecular heat of a compound is equal to the sum of the atomic heats of its constituents"). Devoting himself next to optics, he produced memoirs which entitle him to a high place among the early searchers after a dynamical theory of light. In 1832, by the aid of a particular hypothesis as to the constitution of the ether, he reached results agreeing with those obtained by A. L. Cauchy, and succeeded in deducing laws of double refraction resembling those of A. J. Fresnel. He made contributions to the mathematical theory of electrodynamics, and in papers published in 1845 and 1847 established mathematically the laws of the induction of electric currents. His last publication was on spherical harmonics (*Beiträge zur Theorie der Kugelfunctionen*, 1878). He died at Königsberg on May 23, 1895.

NEUMANN (originally BAMBERGER), **KARL FRIEDRICH** (1793–1870), German orientalist, was born at Reichsmannsdorf, near Bamberg, on Dec. 28, 1793. He studied philosophy and philology at Heidelberg, Munich and Göttingen. From 1822 to 1825 he was a teacher at Spires; then he learned Armenian in Venice and visited Paris and London. In 1829 he went to China, where he amassed a library of about 12,000 valuable books and manuscripts, which he presented to the royal library at Munich. In 1831 Neumann became professor of Armenian and Chinese at Munich. In 1852 he was removed from his chair on account of his revolutionary views. He died in Berlin on March 17, 1870.

Neumann wrote *Geschichte des englischen Reichs in Asien* (Leipzig, 1851); *Geschichte der Vereinigten Staaten von Amerika* (Berlin, 1863–1866); *Versuch einer Geschichte der armenischen Literatur* (Leipzig, 1836); *Die Völker des südlichen Russland* (1846, and again 1855); and several translations from the Chinese. The journal of the Royal Asiatic Society (London, 1871) contains a full list of his works.

NEUMES, the signs employed in Western musical notation before the introduction of the staff. (Gr. νεῦμα, a sign). They were, in the first instance, merely rough expression marks placed over the words, to guide the singers of the plainsong melodies, the melodies themselves being learned by ear, and hence they gave no indication as to the pitch or time-relations of the notes. Gradually, however, they became more and more elaborate and precise, then their positions on the paper were varied to indicate pitch, though at first without the employment of lines; subsequently lines were introduced, and so, step by step, the whole present-day system was evolved. (*See* MUSICAL NOTATION.)

NEUMÜNSTER, a town in the Prussian province of Schleswig-Holstein, Germany, lies on the Schwale, 40 mi. N. of Altona-Hamburg by rail, and at the junction of lines to Kiel, Vamdrup (Denmark) and Tönning. Pop. (1939) 52,719. The name, which was originally Wipendorp, is derived from an Augustine monastery, founded in 1130, and is mentioned as *novum monasterium* in a document of 1136. Its industrial importance began in the 17th century, when the cloth-workers of Segeberg, a town to the south-east, migrated to it. It became a town in 1870. It is, after Altona, the most important industrial town in the province.

NEUNKIRCHEN or OBER-NEUNKIRCHEN, a town in the Saarland territory, Germany, on the Blies, 12 mi. N.E. of Saarbrücken. Pop. (1939) 39,866, consisting almost equally of Protestants and Roman Catholics. The town is first mentioned in 1280, and became important industrially during the 18th century. The principal industrial establishment is an iron-foundry. Around the town are important coal mines. The castle built in 1570 was destroyed in 1797.

NEUQUÉN, an inland territory of Argentina on the Chilean frontier, between the Colorado and Limay rivers, with the province of Mendoza on the north and the territory of Río Negro on the east and south. Area, 36,324 sq.mi. Population (1947 est.) 85,958. The greater part of the territory is mountainous, with fertile, well-watered valleys and valuable forests. The eastern part, however, contains large plains showing only stunted vegetation and having numerous saline deposits. The long droughts that prevail in this region have deterred agricultural settlement. Nevertheless, agriculture and stock raising provide the chief sources of wealth. The Neuquén, which unites with the Limay near the 68th meridian to form the Río Negro, is the principal river of the territory of Neuquén. The largest of a group of beautiful lakes in the higher Andean valleys is the celebrated Nahuel Huapí (Lion Grass), which has an area of 216 sq.mi. and which lies partly in the southwest angle of the territory, partly in Río Negro and partly in the republic of Chile. It is the source of the Río Limay and receives the overflow from two smaller neighbouring lakes.

The temperature of the Andean region is cold even in summer, but on the lower plains it is hot in summer. The territory is reached by a light-draught river steamer which ascends the Río Negro to Neuquén, the capital, at the confluence of the Limay and Neuquén, and by railway from Bahía Blanca to Zapala, via Neuquén. The population is concentrated in a few small towns on the rivers and in some colonies in the fertile districts of the Andes. The capital, founded Sept. 12, 1904, had a population (1940 est.) of about 7,500.

NEURALGIA. A symptom, not a disease, neuralgia is manifested by pain along the course of a nerve. Various forms are distinguished according to the nerve affected: suboccipital neuralgia when the pain is in the back of the head and neck, intercostal neuralgia when it is between the ribs, etc. Strictly speaking, the term is restricted to those nerve pains for which no specific cause and no evidence of impaired function of the nerve can be found. Actually the word is often employed for pain caused by local nerve damage when pain is the prominent symptom. Most sciatic neuralgia, for example, is attributable to mechanical compression and stretching of a sensory root of the sciatic nerve from displacement of an intervertebral disc within the spinal canal. One should realize, too, that neuralgic pain is frequently the forerunner of hidden organic disease and that the first consideration in treatment is the search for a definitive cause.

Characteristically the pain of neuralgia is sharp, acute, darting and paroxysmal. The attacks, commonly brief in themselves, may succeed each other without respite for hours or days, robbing the victim of appetite and sleep and reducing him to a state of exhaustion and mental depression. Neuralgia of a nonspecific kind is prone to occur during states of debility and malnutrition from any cause and in association with infections. Exposure, chilling and fatigue are sometimes precipitating causes.

Treatment for relief of symptoms is sometimes of little avail, many cases proving refractory to all measures. Pain is controlled, as well as can be, by ordinary analgesics, together with hypnotics if required for sleep, avoiding narcotics if at all possible. Hot or cold applications, diathermy or repeated local anaesthesia with novocaine may be beneficial. For extremely severe or prolonged attacks, palliative operations on sensory nerves, roots or their central connections have been resorted to with differing success.

The following types of neuralgia, all of common occurrence, deserve special mention.

Trigeminal Neuralgia (*tic douloureux*), so-called because the pain is strictly confined to one or all of the three divisions of the main sensory nerve of the face. Pain appears in the lower jaw, cheek, tongue and temple, in the upper jaw, cheek and side of the nose and in the forehead and eye, depending on the division affected. The flashing, stabbing, boring pains, usually lasting less

than a minute, are excruciating, and the sufferer commonly recoils from his agony with a spasmodic facial contortion. Characteristically, stimulation of circumscribed areas of the face or mouth, eating, talking or even the lightest touch may provoke an explosion of neuralgic pain. The victim sedulously avoids such contingencies. There is little, if any, discomfort during the intervals between paroxysms. The condition, for which no cause can usually be found, afflicts the elderly and may have spontaneous remissions. Medical therapy is of little help, but surgical treatment is effective. Injection of the affected branch with alcohol gives prompt relief but rarely for more than a year or two. Cutting of the sensory roots within the skull, an operation having a mortality rate of less than 1%, affords almost certain permanent freedom from pain.

Atypical Facial Neuralgia differs from trigeminal neuralgia in that the pain, although felt in the face, tends to be more diffuse, is duller in quality, persists for minutes or hours and is not ordinarily provoked by sensory stimulation. The nature of the condition is obscure but it seems probable that it is a disorder of the sympathetic nervous system and may be a variant of migraine. Some cases respond to a regime of treatment for migraine, but most are more intractable. All do poorly with surgical treatment.

A variety of paroxysmal, unilateral nocturnal neuralgic pain involving the eye and temple, often called histamine headache in the United States, is a closely related condition.

Postherpetic Neuralgia is merely the continuation for weeks, months or sometimes years of the nerve-root pain which is always present in the region of the skin eruption during the acute stage of an attack of shingles (*herpes zoster*). This distressing sequel of the disease affects mostly elderly persons. X-ray therapy appears to benefit some patients. Otherwise, once established, the pain stubbornly resists treatment.

NEURASTHENIA, a term for a group of symptoms characterized chiefly by feelings of persistent weakness, chronic fatigue and irritability, loss of interest in external events and a depressive mood. The concept of neurasthenia underwent many modifications after 1869 when both George M. Beard and Edwin H. Van Deusen independently employed the term to designate a specific psychiatric syndrome. Its use as a substantive is obsolescent. When used in its adjectival form as *neurasthenic* reaction, syndrome, state, disturbance or symptom, reference is made to the fact that it is no longer regarded as a disease entity. Neurasthenic symptoms usually appear in combination with other psychoneurotic manifestations. Occasionally they represent precursors of a psychotic reaction (*see* PSYCHOSIS) in which there is a temporary or permanent degradation of personality functions as a result of failure of psychological adaptation. The symptoms may also emerge as an initial reaction to damage to the highest integrative centres of the central nervous system. Since the supply of certain metabolites are quickly exhausted in febrile illnesses and can be easily replenished, prolonged postinfectious neurasthenic reactions are no longer commonly encountered.

Beard grouped together almost 100 symptoms which he attributed to exhaustion of the nervous system in consequence of dephosphorization of nerve cells. In this large constellation he included loss of strength, generalized discomfort, recurrent aches and pains, inability to concentrate and sleep, poor appetite, persisting weakness of the spinal musculature, hysterical and hypochondriacal manifestations, sexual difficulties and numerous phobias. Van Deusen's description of the clinical picture was more circumscribed and, in all probability, derived from observations on patients in cachectic states which developed during prolonged febrile or psychotic episodes when the dietary intake was not adequate to sustain the metabolic needs of nervous tissue. Both investigators reported sequelae that suggest the symptomatology of advanced polyneuropathy associated with vitamin deficiency. Beard's writings stimulated many workers to attempt to separate from the large group of symptoms more clearly defined clinical patterns. For example, in 1894 Sigmund Freud suggested that anxiety neurosis be distinguished from neurasthenia. As psychoanalytical and psychobiological principles were extended into the field of medicine, many of the symptoms Beard described were regrouped as various psychoneurotic reactions. Beard's all-inclusive conception led to a confusion of the meaning of the term which persisted, so that some medical writers failed to distinguish neurasthenic symptoms and anxiety, hypochondriacal, hysterical and obsessional-compulsive states.

The chronic weakness and fatigue probably represents alterations in the muscular attitudes of people under certain emotional stresses which have not yet been correlated with the quantity of muscular effort expended. Neurasthenic symptoms may be understood as the end results of various psychological defensive manoeuvres designed to prevent the expression of feelings or desires that would not be acceptable to the conscious part of the personality. Treatment requires a comprehensive review of the personality development as well as an evaluation of the physiological status. Psychotherapeutic programs should be designed so that the doctor-patient relationship provides multiple opportunities to bring the unacceptable impulses to light. (*See* also PSYCHIATRY.)

NEURITIS, a term denoting inflammation of nerve fibres. Two varieties are known, the localized and the multiple. The localized form frequently follows exposure to cold and may attack a single nerve. Facial paralysis (Bell's palsy) is commonly seen following a neuritis of the facial nerve. Neuritis may follow blows and wounds, stretching or long-continued pressure, as in a dislocation of the elbow joint, or the nerve may be involved in a neighbouring inflammation. The first symptom of a localized neuritis is boring pain along the course of a nerve and its distribution, the part being sensitive to pressure.

Multiple neuritis or polyneuritis may affect many of the peripheral nerves symmetrically and at the same time. For the pathological changes *see* NEUROPATHOLOGY. The causes may be divided as follows: (1) The toxins of acute infective diseases, such as diphtheria, influenza, typhoid fever, malaria, scarlet fever and septicaemia. (2) Acute or chronic poisoning by lead, arsenic, mercury, copper and phosphorous. (3) General disorders: gout, rheumatism, tubercle, carcinoma. (4) The local action of leprosy and syphilis. (5) Endemic disease: beri-beri (*q.v.*). (6) Alcohol, the most common. Alcoholic neuritis is a result of constant steady drinking, particularly of beer. It begins with numbness of the feet and later of the hands, then painful cramps in the legs appear and there is pain on moving the limbs, and superficial tenderness is occasionally present. In other cases the earliest symptoms are weakness of the legs and extreme fatigue, leading to a characteristic "steppage gait," or marked inco-ordination of movement may occur and the gait become ataxic. Trophic changes soon appear, early and rapid muscular wasting occurs, the skin becomes dry and glossy, the nails brittle and the hair thin. In time contractures take place, the hip and knee-joints become flexed and the foot dropped at the ankle. Should the case progress the patient may become bedridden and powerless, and degenerative mental changes may take place, loss of memory, irritability of temper and emotional instability. Early cases may recover completely under treatment. The galvanic and faradaic currents, combined with massage, are useful in helping to restore the wasted muscles, and hot-air baths and warm applications are appreciated.

Neuritis accompanying both beri-beri and alcoholism is the result of deficiency of vitamin B_1.

Arsenical neuritis mostly affects the lower extremities, as contrasted with lead, which mainly paralyzes the fingers and wrists; recovery is even slower than in alcoholic neuritis, the treatment being on the same lines, with the removal of the cause of the dis-

ease. In the neuritis of chronic lead poisoning a fine tremor of the hands is an early symptom and sensory symptoms are usually absent; the muscles affected are the extensors of the wrists, thumb and fingers (*see* LEAD POISONING). The course of the disease is long, and an attempt should be made to eliminate the lead from the system by purgatives and the administration of potassium iodide.

In diabetic neuritis paraesthesia is slight, and the legs are chiefly affected; weakness and ataxia may be present. Trophic sores on the feet are of frequent occurrence in this variety. The treatment is that of the disease. Postdiphtheric neuritis, formerly seen in about 10% of all cases of diphtheria, is now exceedingly rare. Acute polyneuritis with numbness and motor weakness has been noted after various infections, particularly with viruses, together with slight muscular wasting and electrical degeneration. Later, there is loss of sensation in the peripheral portion of the limbs, and the motor weakness may affect the muscles of the trunk and face. Such cases tend toward complete recovery.

In polyneuritis due to metallic poisons BAL (British anti-Lewisite) is helpful. Massage of weak muscles and passive movement of joints may speed recovery. Electric stimulation may also be helpful.

NEUROPATHOLOGY, the general name for the science concerned with diseases of the nervous system. For the anatomy and physiology, *see* NERVE, NERVOUS SYSTEM, BRAIN, SPINAL CORD and SYMPATHETIC SYSTEM. The morbid processes affecting the nervous system are usually clinically divided into two great groups of (1) organic disease, (2) functional disturbance, depending on whether or not symptoms observed during life can be associated with recognizable changes after death. Knowledge of the first group is much more advanced than of the latter, for, given certain symptoms during life, we can, as a rule, predict not only the nature of the morbid process, but its particular locality.

The histological elements which make up the nervous system may also be divided into two groups: (1) the nervous units or neurones, (2) the supporting, protecting and nutrient tissues. Nervous diseases may start primarily in the neurones and cause their degeneration; such may bring about "diseases," or "syndromes" within the nervous system. The nervous units, however, may be affected secondarily by disease processes starting in the supporting, protecting and nutrient tissues within the nervous system; such include changes of the blood-vessels, lymphatics, membranes and the special nervous connective tissue, neuroglia (a residue of the embryonal structure from which the nervous system was developed). Tumours and new growths must also be included.

The causes of pathological processes occurring in the nervous units (neurones) may be divided into internal and external; in all cases except direct injury the two groups are generally more or less combined.

Internal Causes.—Of the factors involved in nervous disease *hereditary predisposition* may first be accented. In 70% of 150 cases of idiocy or imbecility in the London county asylums, Dr. Tredgold found a family history of insanity in some form or another. This predisposition may be convergent, paternal, maternal; from grandparents or even more remote ancestors. Moreover, no study of heredity is complete that does not take into consideration collaterals. Especially does this apply to functional neuroses, *e.g.*, epilepsy, migraine, hysteria and neurasthenia; and to psychoses, *e.g.*, delusional insanity, mania and melancholia, manic-depressive, recurrent or periodic insanity and dementia-praecox or adolescent insanity. Strictly speaking, it is the tendency to nervous disease rather than the disease itself that is inherited, and this is frequently spoken of as a neuropathic or psychopathic taint.

EXTERNAL CAUSES

The external causes producing morbid changes in the nervous elements are: I. Abnormal conditions of the blood and lymph. II. Excess or deficiency of normal stimulation, or existence of abnormal stimulation. III. Injury or diseases of supporting, enclosing or vascular tissues.

Abnormal Conditions of the Blood and Lymph.—The essential causes of change in environment of the nervous elements (neurones) are: (1) Deficiency or absence of blood-supply to the nervous system in general (as after severe haemorrhage), or to some particular portion, owing to local vascular disturbance or occlusion. (2) Alterations in the normal condition of the blood, due to (*a*) deficiency or absence of certain essential constituents, (*b*) excess of certain normal constituents, (*c*) the presence of certain abnormal constituents produced within the body, or entering it from without. All these act through the cerebro-spinal fluid, a special lymph secreted by the choroid plexus in the ventricles of the brain by which the neurones are bathed.

(1) *Quantity of Blood Supply.*—Syncope or fainting occurs when the blood supply suddenly fails to reach the higher centres of the brain; such may arise from sudden reflex arrest of the heart's action, or from localized spasms of the cerebral vessels. The effects of embolism and thrombosis are considered later.

(2) *Quality of Blood Supply.*—(*a*) Insufficiency of oxygen, as in anaemia, leads to functional depression, lassitude and mental fatigue. Impoverishment of the blood in women by frequent pregnancies and excessive lactation causes neuralgia, nervous exhaustion and may aid in the development of neurasthenic or hysterical reactions. The tendency of psychoneuroses and psychoses to occur and recur at menstrual and climacteric periods in women, indicates that these factors themselves are of periodic significance. These are connected with the reproduction functio· rather than with the blood however. The most striking examples of the effect of absence or "sub-minimal" deficiency of a normal constituent of the blood upon the development and functions of the nervous system are afforded by cretinous idiots, who are born without thyroid glands, and whose brains never develop in consequence; and by those people who suffer from myxoedema (*q.v.*) occasioned by the absence of thyroxin or other products of the internal secretion of the thyroid gland. The proof of this is shown by the disappearance of the nervous phenomena, slowness of thought, slowness of speech, etc., after thyroxin or a preparation of the gland has been continuously administered. This is an excellent example of a reversible process.

(*b*) Excess of certain Normal Constituents in the Blood.—Excess of carbonic acid causes drowsiness, and probably in asphyxia is one of the causes of the convulsions. All the nitrogenous waste products are normal constituents of the blood; but should oxidation be incomplete, from disease of the liver, or should these substances accumulate in the blood, owing to inadequate function of the kidneys, uraemia may supervene, the manifestations of which are headache, drowsiness, unconsciousness or coma, epileptiform convulsions and sometimes symptoms of polyneuritis. Again, in Graves's disease (hyperthyroidism), nervous phenomena, in the form of exophthalmos, fine tremors, palpitation and mental excitement have by some authorities been explained by the excess of thyroid internal secretion, due to the enlargement and increased functional activity of the gland.

(*c*). The presence of abnormal constituents in the blood is a most important cause of disease of the nervous elements. These are: Poisons produced within the body (α) by perverted function of organs or tissues, auto-intoxication; (β) by the action of micro-organisms, protozoa and bacteria, upon the living fluids and tissues of the body; (γ,) poisons introduced into the body from without.

(α) Poisons resulting from perverted Function of the Organs.—Nervous symptoms follow auto-intoxication by products of disordered digestion, fatigue products (*e.g.*, sarcolactic acid in prolonged muscular spasm), excess of uric acid, phosphates, oxalates, sugar, bile, hepatic products as in acute yellow atrophy. In pernicious and certain grave anaemias, the degenerative changes in

the spinal cord found in some cases is due, chiefly, to some neuro-toxin, which probably arises from imperfect metabolism or absorption from the alimentary canal. In auto-intoxication, disease of one organ or tissue is apt to establish a vicious circle which is constantly enlarging; therefore nervous symptoms manifesting themselves in the course of a disease add much to the gravity of the complaint.

(β). Poisons produced by infective Micro-organisms.—Some of these have a general devitalizing influence by altering the blood and producing fever. In acute infectious diseases, delirium is a frequent complication; in severe cases, stupor and coma may occur, and in this extreme stage the nerve cells undergo an acute morbid bio-chemical change. These particular poisons may have marked selective toxic action upon particular parts of the nervous system.

Poisons may have a *selective influence* upon some part of the nervous system. The syphilitic organism and its poisons are most important factors in the production of two progressive degenerations of the nervous system—one affecting especially the afferent conducting tracts of the spinal cord, namely, tabes dorsalis (locomotor ataxia), and the other affecting especially the frontal and central convolutions of the cerebral hemispheres, namely, general paresis (general paralysis of the insane). When syphilis attacks the supporting, enclosing and nutrient vascular tissues, a predilection to affect structures about the base of the brain occurs, and paralyses of the third nerve are frequent in this disease. Other examples occur in rabies, tetanus, diphtheria (*q.v.*).

Protozoa and Diseases of the Nervous System.—The relation of protozoa to the existence of widespread diseases affecting men and animals is becoming yearly of greater importance. Certain diseases in which the nervous system is profoundly affected are now explained by the invasion of the tissues of the body by these lowly organisms, for example, African sleeping sickness due to a special protozoan; Syphilis due to *Spirochaeta* or *Treponema pallida;* Malaria due to *Haematozoon malariae.*

The bacterial invasion of tissues is generally characterized by a migration of polymorpho-nuclear leucocytes, but protozoal invasion is characterized by a formative hyperplasia of the fixed cell tissues, endothelial, epithelial and conjunctival, and there is a close similarity in the defensive reaction of the tissues to all forms of protozoal invasion.

When the nervous system is affected a local or general chronic meningo-encephalitis is set up, characterized by a meningeal and perivascular infiltration with lymphocytes and plasma cells, occasioned by a chronic irritative process, presumably caused in the case of sleeping sickness for example by the presence of trypanosomes in the actual cerebro-spinal fluid. The same perivascular and meningeal infiltration with plasma cells and lymphocytes is found in syphilitic diseases of the nervous system.

Pathology of the Cerebro-spinal Fluid.—Pathological changes in the cerebro-spinal fluid are important in the diagnosis of nervous diseases. Normal cerebro-spinal fluid is clear like water; it has a specific gravity of 1·006 and resembles in its composition the blood *minus* its corpuscular and albuminous constituents. Being secreted by the choroid plexus, if any cause, such as tumour or meningitis, should interfere with its escape from the ventricles it gives rise by pressure to *internal hydrocephalus* and cerebral anaemia which may occasion epileptic convulsions and various degrees of drowsy stupor, lethargy, unconsciousness and even coma. Lumbar puncture has proved of some use in treatment, but is invaluable in the diagnosis of various diseases of the central nervous system. The fluid withdrawn should be centrifuged and the deposit examined microscopically if necessary after staining by suitable methods; the existence of cells indicates disease of the central nervous system. In general paresis, cerebro-spinal syphilis and tabes dorsalis even in early stages, the deposit consists almost entirely of lymphocytes. Some evidence of the progress of the disease and the effect of treatment may be obtained by counting the number of cells at different periods. In tuberculous meningitis there are also lymphocytes in abundance; tubercle bacilli cannot readily be found, but if the fluid be injected into a guinea pig, the animal will develop tubercle. In epidemic cerebro-spinal meningitis the cells in the deposit are polymorpho-nuclear leucocytes and in the leucocytes can be seen *Diplococcus intracellularis.* Septic, pneumonic and pyogenic organisms may also invade the central nervous system giving rise to meningitis, and in these cases the deposit will be polymorpho-nuclear leucocytes, and perhaps the specific organisms may be seen in stained preparations; but if not, they can be obtained by cultural methods.

Other formed elements which may be found are large cells, macrophages containing blood pigment; these cells indicate that haemorrhage has occurred. One of the most important uses of lumbar puncture has been the discovery of the cause of African sleeping sickness. The fluid withdrawn and centrifuged is found to contain large numbers of lymphocytes and plasma cells in addition to specimens of the actively moving organism *Trypanosoma gambiense,* a flagellate. In the forms of disease here described as containing cells in the centrifuged deposit, there is also in the fluid an appreciable amount of proteins. If pathological cerebro-spinal fluid be added to an equal quantity of saturated solution of sodium sulphate there will be a distinct turbidity indicating the presence of proteins in appreciable quantity. This appreciable quantity of proteins is especially significant in the case of fluid withdrawn from cases of general paralysis or tabes, for it goes *pari passu* in amount with the Wassermann *sero-diagnostic reaction for syphilis.*

African sleeping sickness is characterized by a progressive *lethargy,* paresis, tremors and the signs and symptoms of neural exhaustion without neural destruction; it comes on slowly and insidiously often years after infection and eventually terminates fatally by intercurrent disease or paralysis of the bulbar centres. Examination of the central nervous system explains the fatal lethargy; the perivascular and meningeal lymphatics are filled with lymphocytes and plasma cells and the neuroglia supporting cells have undergone a rapid proliferation. The effect of this morbid process is to deprive the neural elements of oxygen and nutrition; the neurones in consequence, although not destroyed, are nevertheless unable to function for more than a brief period.

Poisons Introduced into the Body.—The most widespread and potent cause of nervous and mental disease is the abuse of alcohol-containing liquids. At least 20 per cent of the inmates of the asylums of London are admitted with a history of alcoholism. Whether alcoholism is a cause or a result is still debatable. In not more than 10% is alcohol the efficient cause of the mental disease; in many it is only a contributory factor, and in not a few the lapse from moderation to intemperance is one sign of a mental disturbance. To people with unstable nervous systems a relatively small quantity of alcohol may act as a poison. Thus epileptics, imbeciles, criminals, potential lunatics, and the subjects of head injury are liable to become anti-social and dangerous to themselves and others by indulgence in quantities of alcohol which would have no harmful effect upon the mentally stable and sound individual. However, chronic alcoholics form a large proportion of those guilty of crimes of violence, homicide, suicide, and sexual offences. Another common effect of alcohol is *peripheral polyneuritis* (*see* NEURITIS), although frequently changes occur as well in the ganglion cells, from which the axis cylinders of the nerves have their origin. (*See* NERVOUS SYSTEM.) Alcoholic polyneuritic psychosis affecting women in many ways resembles delirium tremens (*see* DELIRIUM); the fact that neuritis occurs much more frequently in women is probably associated with the fact that when the female breaks through the resistance to her conflicts by the use of alcohol her regression is deeper and her indulgence greater. Many other poisons, notably lead and arsenic, the specific fevers before mentioned, syphilis and alterations of the blood due to imperfect metabolism, such as occur in diabetes and gout, may produce, or become important factors in producing, peripheral neuritis. The outbreak of arsenical neuritis from beer containing this poison in Manchester in 1900 is of interest from that fact that the symptoms closely resembled acute alcoholic neuritis. A distinctive feature, however, was the pigmentation of the skin and the severity of the nervous symptoms.

A disease, common in the East, termed beri-beri (*q.v.*),

is a form of neuritis. Anaesthetic leprosy is an interstitial inflammation of the nerves due to the *Lepra bacillus*. Among the nervous diseases caused by occupation may be cited lead poisoning (*q.v.*). Lead also produces a chronic inflammation of the cerebral cortex, *Encephalitis saturnina*, causing a complex of symptoms, namely dementia, loss of memory, weakened intellect, paresis and epileptiform seizures, hallucinations of sight and hearing, and mental exaltation or depression. Mirror-makers suffer with characteristic fine tremors, from the slow absorption of mercury into the system. Workmen at indiarubber factories may suffer from severe mental symptoms, owing to the inhalation of the fumes of carbon bisulphide. Serious nervous symptoms have followed carbon monoxide poisoning. Cases which have recovered from the immediate effects have suffered with dementia and symptoms of disseminated sclerosis, the result of multiple haemorrhagic softenings.

Certain other poisons, besides alcohol, act upon the nervous system when continually entering the body as the result of a *habit*, namely, absinthe, ether, cocaine, opium, morphin, hashish and tobacco. Each of these has a selective influence upon certain parts of the nervous system. In illustration thereof may be mentioned impairment of central vision in tobacco amblyopia. Other diseases of like kind are under pellagra (*q.v.*), ergot (*q.v.*), botulism (*see* MEDICAL RESEARCH).

Adequate and Pathological Stimulation.—The nervous system in the form of systems, groups and communities of neurones, each with special functions, yet all woven together in one harmonious whole, develops in a particular way in consequence of the awakening influence of stimuli from without and from accumulated instinct stimuli from within. Consequently nervous structures which are not used at all, or badly used are liable to undergo regressive metamorphosis and atrophy; thus amputation of a limb in early life causes atrophy of the nervous structures which dealt with the sensations and movements of the part. This may be seen in the grey (synapses) and white matter (conducting pathways) of the spinal cord; there may also be found an atrophy of the psycho-motor neurones of the brain functionally related to the sensory and motor terminal areas of the involved limb. The converse is also true; the longer a perverted function exists, the more unlikely it is to disappear and ultimately to bring about irreversible structural changes.

Mental pain in the form of grief, worry, anxiety, fright, shock, violent emotions (pleasurable or painful), disappointed love, and excessive intellectual work, frequently precede and determine various types (*a*) of psychoses, *e.g.*, manic-depressive, paranoid; (*b*) of neuroses, *e.g.*, compulsion neurosis, hysteria, epilepsy, hystero-epilepsy; (*c*) or gross brain disease, *e.g.*, apoplexy, thrombosis, arteriosclerotic degenerations.

Visceral reflex irritation affords many examples of organ neuroses, the symptoms of which may be set up by irritation of the viscera, *e.g.*, intestinal worms. Teething and indigestible food are often the exciting cause in infants and young children of convulsions and spasms of the glottis (spasmophilic). Some anomalies of the female reproductive organs act as exciting causes in the release of hysterical reactions. Paroxysmal exacerbations of emotional disturbances are liable to occur at the menstrual period or menopause. Here the stimulus proceeds from the reproductive instinct. The irritation of a carious tooth may produce spasmodic tic or trigeminal neuralgia. Wax in the ear may occasion vertigo and tinnitus; and grave errors of refraction in the eyes may be an accessory factor in the causation of attacks of migraine. Irritation of the receptors of the vagus in almost any part of its widespread visceral origin may lead to vomiting. The characteristic pain of angina pectoris, which radiates down the inner side of the left arm, is partly explained by the fact that the cardiac branches of the sympathetic follow the vascular supply of the arm, and the stimulus from the diseased aorta or coronary vessels radiates as pain in the vascular area. The entire explanation is extremely complex[1]. This is one example of a great number of *referred pains* studied so extensively by the English observers, Head and Mackenzie.

[1]Spiegel, Wien, Kl. Woch. 40, 1927, 853.

Injury or Disease of Enclosing or Supporting Structures may lead to paralytic or irritative lesions of the nervous system, or the two may be combined. Blows or wounds of the head and spine may damage or destroy the nervous structures by shock or direct injury. Concussion of the brain or spinal cord may occur, as a result of injury, without any recognizable damage of the enclosing structures or even the central nervous system. Shock, due to concussion, can thus be explained as resulting from molecular or bio-chemical changes in the nervous structures.

Direct injury may cause local destruction of the nervous tissue; but wounds and diseases of the enclosing and supporting structures, if non-infective, give rise only to such symptoms as accord with the nerve structure irritated or destroyed. Should, however, the wound or diseased structure become infected, the disease spreads and becomes generalized; likewise the symptoms. Of the many causes of infective inflammation of the brain itself, middle-ear disease is the most important. It is very liable, when neglected, to be followed by a septic meningitis, encephalitis and brain abscess, the most frequent seat of which is in the adjacent temporal lobe, but it may involve other parts of the brain as well, for example the cerebellum and frontal lobe. The peripheral nerves may be destroyed or irritated by direct injury, disease or new growth in adjacent tissues, or they may be involved in the callus thrown out round the seat of a fracture.

Diseases of the blood-vessels are among the most frequent causes of gross brain disease. Arteries or veins—more frequently the former—may become blocked or ruptured from various causes. The immediate effect is a disturbance or loss of consciousness, and the individual may be "struck down" (*see* APOPLEXY) and never regain consciousness (*see* COMA). Should consciousness return, more or less permanent loss or disturbance of function becomes obvious. Paralysis of some form, especially hemiplegia, is commonest. The cerebral arteries, usually the left middle cerebral may be occluded by embolism (*see* THROMBOSIS AND EMBOLISM). The area of brain supplied by that artery undergoes softening in consequence, resulting in paralysis of the opposite half of the body (hemiplegia) associated with aphasia when the paralysis affects the right side in a right-handed person (*see* Plate, fig. 1). When the embolus is infective, as in ulcerative endocarditis, it not only blocks the vessel but leads to an infective inflammation and softening of its coats, with the formation of an aneurism. The aneurism may suddenly rupture into the substance of the brain and produce apoplexy. Most cases of apoplexy from cerebral haemorrhage in young people are due to this cause. Softening may also arise from coagulation of the blood (thrombosis) in the arteries or veins. Many causes generally combine to produce thrombosis, viz., a weak acting heart and altered conditions of the blood. It is sometimes met with in the cachexia of phthisis and cancer, in typhus and pneumonia, after parturition and in marasmus at all periods of life, but especially in the very young and very old. But thickening, roughening, and a degenerated condition of the cerebral arteries known as atheroma, when associated with a weak acting heart is especially liable to give rise to thrombosis and softening, and is a very common cause of apoplexy, paralysis and mental deterioration in people who have passed middle life. General disease of the arteries of the body, with chronic Bright's disease and high arterial pressure, is frequently associated with the formation of minute aneurisms upon the cerebral arteries, which may rupture and cause apoplexy.

This is especially liable to occur in a vessel supplying the basal ganglia, the effused blood tearing through the motor efferent fibres (pyramidal tracts) lying between the optic thalamus and the corpus striatum (*see* Plate, fig. 3). The result is hemiplegia of the opposite side of the body. Disease of the arteries of the central nervous system, occurring in a person under 40, is generally due to syphilis, the virus of which produces an inflammation of the inner coats (*see* ARTERIES, DISEASES OF). The thickening and narrowing of the lumen with loss of elasticity of the arteries of the brain generally may suddenly or gradually set up cerebral anaemia and give rise to semi-comatose and comatose or even apoplectic states. Occlusion by the inflammatory proliferation or by the sudden clotting of blood in the diseased vessel may occur, the immedi-

THE HUMAN BRAIN AND SPINAL CORD IN HEALTH AND DISEASE

1. Horizontal section across a brain showing a softening in the left hemisphere due to a blockage of a cerebral artery. This caused right sided hemiplegia and aphasia
2. Right cerebral hemisphere of an adult man; normal state of convolutions
3. Horizontal section across a brain in which a haemorrhage in the right hemisphere had damaged the motor path to the left arm and leg causing left hemiplegia
4. Right half of the brain of a microcephalic idiot. There is complete absence of any convolutional pattern in the cortex of the brain, which closely resembles that of the sheep. The cerebellum is normally developed
5. Microscopic section of a degenerated area of cerebral cortex overlying a tumour, showing enlarged neuroglia cells
6. Right half of the brain of a microcephalic idiot (walnut type). Here the convolutions have shrunk and a bag of fluid replaces the temporal pole. This is due to a vascular lesion before birth
7. Microscopic section of the cerebral cortex of a case of general paralysis showing inflammatory cells surrounding a small vessel

8–11. Sections across the spinal cord in different common forms of spinal paralysis (the undamaged nerve fibres are stained black): 8. "Locomotor ataxy" in which the ascending or sensory fibres in the posterior columns degenerate. 9. "Disseminated sclerosis," in which patches of degeneration (pale areas) are scattered haphazard, damaging both sensory and motor fibres. 10. "Subacute combined degeneration," usually associated with anaemia, in which both sensory and motor fibres are affected. 11. "Motor neuron disease," in which all the descending or motor fibres degenerate

ate effect of which may be an epileptic or apoplectic fit; the result is softening; and as any or all of the arteries of the brain may be affected successively, simultaneously, or at random, the symptoms may be manifold. They may be general or local, and are often associated with inflammation of the membranes. The disease, under treatment, may abate, and the paralytic or mental phenomena partially or completely disappear, indicating the restoration, or partial restoration, of the circulation in the diseased arteries; sometimes with the lapse of treatment, and sometimes without, new symptoms manifest themselves, showing that the disease has attacked a fresh set of arteries. *Disseminated sclerosis* (*insular*) is another progressive random, morbid process, the pathology of which is not fully understood, but is probably due to some toxic cause. Islands of nervous tissue undergo a morbid change, commencing in the myelin sheath and ending in an increase of the supporting neuroglia tissue at the expense of the true nervous tissue (*see* Plate, fig. 11).

Tumours and new growths in the central and peripheral nervous systems may be primary or secondary; the former arise in the supporting, enclosing or nutrient tissue elements; the latter are metastatic deposits from tumours originating elsewhere. Tumours may be single or multiple, the special symptoms occasioned depending upon the seat of the tumour and whether it destroys or only irritates the adjacent nervous tissue. Tumours situated within the cranial cavity cause general symptoms, namely, optic neuritis, severe headache and vomiting; these symptoms, which are caused by increased intracranial pressure, are more severe in rapidly growing vascular tumours, even though small, than in large slow-growing tumours. Some tumours are highly vascular and a large thin-walled vessel may suddenly rupture and cause an apoplectic fit. If the growth is situated in a portion of the cortex having some special localizing function, *e.g.*, the motor area, it is likely to give rise to epileptiform convulsions, starting in a limb or definite group of muscles; but the irritation usually spreads to the whole motor area of the same side, and even extends to the opposite hemisphere, by an overflow of the discharge through the corpus callosum. In such case there is loss of consciousness. If, however, the tumour destroys the cerebral cortex of a particular region, it may give rise to a paralytic lesion, *e.g.*, paralysis of the arm.

Diseases of the blood-vessels, or of supporting and enclosing tissues, produce secondary degenerations of the nervous system. The symptoms, like the lesion, are obtrusive; frequently arising suddenly, they may in a short time terminate fatally, or tend towards partial or complete recovery. Various forms of motor and sensory loss and disturbance of function may arise, indicating destruction or disturbance of particular regions of the central nervous system; and degenerations in certain tracts and systems of fibres arise, corresponding in histological character with those observed when a nerve fibre is separated from its cell of origin by section (secondary degeneration of Waller and Türck). This form of degeneration must be distinguished sharply from primary degeneration, which is due to an inherent nutritional defect of the nerve cell and all its processes (the neurone), in which a regressive metamorphosis occurs; it starts in the myelin sheath and the fine terminal twigs of the axis cylinder and dendrons, and proceeds back to the main branches and trunk, eventually destroying the trophic and genetic centre itself, the nerve cell. These *primary* degeneration processes are insidious in origin, progressive in character, and nearly always fatal; they, therefore, are associated with a progressive evolution of symptoms.

To cite some examples: (1) *Locomotor ataxy* (tabes dorsalis), is a primary degeneration affecting the *afferent* sensory system of neurones. (2) *Progressive spinal muscular atrophy* is a disease of the *efferent* motor system of neurones of the brain and spinal cord. Infantile paralysis (*Anterior poliomyelitis*), is an acute inflammation causing destruction chiefly of the spinal motor neurones of the ventral horn. It differs from the progressive spinal muscular atrophies in its sudden onset and non-progressive character; it resembles them in producing paralysis of muscles without sensory disturbance. (3) *General paralysis of the insane* (general paresis) is a degeneration which begins in the association system of neurones of the cerebral cortex, but frequently is associated with degeneration of the afferent or efferent systems.

The psychoneuroses and benign psychoses have not been satisfactorily explained by definite morphological changes in the actual brain substance. We know little or nothing accurately about the morbid histology of certain chronic psychoses, or defect states, except as regards the morphological changes met with in cases of amentia and dementia. The large and illy circumscribed groups, called idiocy and imbecility, are associated with arrest of development of the brain, the naked-eye evidence of which may be afforded by small size and simplicity of convolutions of the brain as a whole or in part (*see* Plate, figs. 2, 4 and 6); and the microscopical evidence by arrest, or imperfect development, of structures connected with the higher functions of the mind, namely, the association neurones in the more superficial layers of the cerebral cortex. Various degenerative processes, either primary or secondary, broadly termed dementics, are associated with progressive decay and atrophy of the superficial layers of the grey matter of the cortex, and naked-eye evidence thereof is afforded by partial or general wasting of the cerebral hemispheres, accompanied with thickening of the pia-arachnoid membrane, atrophy of the convolutions, and with deepening and widening of the intervening sulci. Since the modern studies on this subject of V. Economo, Jakob, the Vogt's Josephy, Fünfgeld, Spatz, Spielmeyer and others have given a definite architectonic and myelotectonic knowledge of the cortex as well as the striatum the older studies of a former generation are obsolete. A newer cortical and subcortical pathology is being written and is to be found in special articles in this edition. At the present time a generalized neuropathology cannot be written.

The cerebro-spinal fluid fills up the space in the cranial cavity caused by the atrophy of the brain; consequently there is a great excess of this fluid. This wasting so characteristic a finding in general paralysis is especially due to atrophy of the cells and fibres of the superficial grey matter of the cortex, sections of which, examined microscopically, after suitable staining, show great poverty, or complete loss, of three sets of delicate myelinated fibres, namely, tangential, super-radial and the inter-radial corresponding to the line of Baillarger. This degeneration of the superficial association fibres of the cerebral cortex affects especially the frontal and central convolutions, and is the earliest and most constant microscopical change in general paresis. It is accompanied usually by meningeal and vascular changes, atrophy of the nerve cells, the proliferation of the neuroglia (fig. 5); especially characteristic is the perivascular infiltration with lymphocytes and plasma cells (*see* Plate, fig. 7). It was, indeed, thought that this condition of the vessels was pathognomonic of general paresis; it certainly is not, for it is found throughout the central nervous system in cases of African sleeping sickness and the arterial types of neurosyphilis. It has sometimes been known to occur in the neighbourhood of cerebral tumours but it is not found in uraemia or lead encephalitis.

Microscopical Changes in Degeneration of the Neurone.—About 1850, Waller demonstrated that a nerve fibre undergoes degeneration to its termination when separated from its cell of origin; hence the term "Wallerian degeneration." Embryological researches by Prof. His showed that the axis-cylinder process (the essential conducting portion of the nerve fibre) is an outgrowth of the nerve cell. The cell, therefore, is the trophic and genetic centre of the nerve fibre. Acute alterations and death of the nerve cells may occur from toxic conditions of the blood; from high fever (107°–110° F); arrest of the blood supply, as in thrombosis and embolism; or actual destruction by injury, haemorrhage or inflammation. These morbid processes produce, as a general rule, bio-chemical as well as morphological changes in the nerve cell and its processes. When a nerve cell dies, the nerve fibre undergoes secondary degeneration and death; that is to say, the whole neurone dies, and regeneration, at any rate in the higher vertebrates, does not take place. Restoration, or partial restoration, of function is due to other structures taking on the function, and the more specialized that function is, the less likely is restoration to take place. If, however, a peripheral

nerve is divided, its component fibres are merely severed from their cells of origin. All that portion of the nerve which is in connection with the nerve cells of origin practically undergoes no change. The peripheral portion undergoes degeneration, but from the central end of the nerve new axis cylinders again grow out and a new nerve is formed. With this regeneration comes restoration of function, which may be hastened by suturing the ends of the cut nerve. A similar regeneration, however, does not occur after section of fibres of the white matter of the central nervous system, and this may be due to the fact that the nerve fibres of the white matter of the cerebrospinal axis possess no nucleated sheath of Schwann, which plays an important part in regeneration; in the present writer's opinion, the neurilemmal sheath of the old fibre forms a new protoplasmic basis, into which the axis cylinder from above grows, the passage of stimulus determining its function. The writer, working in conjunction with Prof. Halliburton, has shown that the characteristic microscopical changes in the myelin sheath which occur in the process of degeneration are due to a splitting up of the complex phosphoretted substance "protagon" into glycero-phosphoric acid, choline and oleic acid by a process of hydration. The Marchi reaction, so useful for demonstrating degeneration of the central and peripheral nervous systems, is dependent upon the fact that the myelin sheath, after hardening in a solution of bichromate of potash, does not turn black when acted upon by osmic acid, whereas the simpler non-phosphoretted fatty product of degeneration is stained black. When the Marchi reaction of degeneration is fully developed, it has been ascertained that the nerve yields no phosphorus. The degeneration resulting from section of a nerve is termed *secondary*, to distinguish it from another, *primary*, due to slow and progressive decay of the whole neurone, beginning usually at the terminal twigs and proceeding back towards the cell body with its contained nucleus. These primary degenerations involve systems of neurones, correlated by function rather than by anatomical situation. Examples have been given already. The cause of primary degenerations is probably a defect inherited or acquired in the *vita propria* of the neurones affected. They slowly atrophy and disappear, and their place is filled up by an overgrowth of the supporting neuroglia tissue (*see* Plate, fig. 9). This overgrowth of dense tissue is termed sclerosis and was erroneously considered to be the cause, instead of the effect, of the atrophy of the nervous tissue. (F. W. Mo.)

NEUROPTERA, the term used in zoological classification for that order of insects which includes the alder flies, snake flies, ant-lion flies, lacewings and their allies. They comprise small to rather large soft-bodied insects with usually elongate feelers and two pairs of similar, net-veined, membranous wings; the wings are closed rooflike over the body when at rest and the hind pair are almost always without a plicated posterior lobe. The mouth parts are for biting, the tarsi are five-jointed and there are no cerci or tail feelers. All Neuroptera undergo complete metamorphosis and the larvae are active and predatory with well developed antennae, sense organs and legs; they are mostly terrestrial but some are aquatic. The pupae have the appendages free and are generally enclosed in silken cocoons.

Rather more than 2,000 species of Neuroptera were known by 1945, and of those only a little more than 60 occur in the British Isles while about 200 species are found in the United States.

Neuroptera are all insects of weak flight, they are rarely abundant in individuals and feed mostly upon soft-bodied insects or liquid matter such as honey dew. Most of the species have beautiful net-veined wings which often exhibit a complex reticulation owing to the presence of numerous accessory veins. There are numerous veinlets arising from the costal vein and vein Rs is generally pectinately branched. In their larval stages they are exclusively predaceous. The order is divided into two suborders, viz., the Megaloptera and the Planipennia as given below.

SUBORDER I. MEGALOPTERA

Veins with little or no tendency to fork at the margins of the wings; vein Rs with but few extra branches. Larvae with biting mouth parts; pupae not enclosed in a true cocoon.

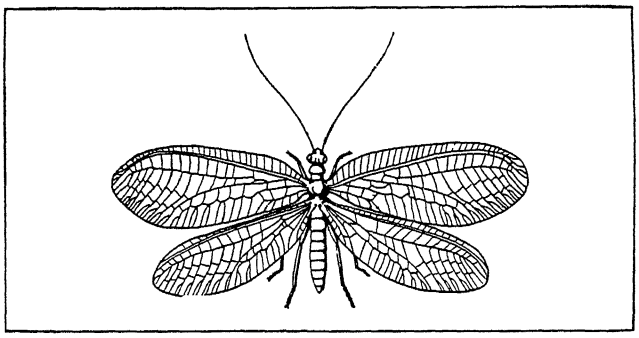
This group includes a small number of archaic insects separable into two superfamilies comprising about 200 species throughout the world. (1) The Sialoidea, all with aquatic larvae, include the alder flies (*q.v.*) (family Sialidae), so-called because in England the adults often frequent alders along the banks of streams. Their larvae respire by means of seven or eight pairs of slender, jointed, abdominal gills. The genus *Sialis* is widely distributed with two British and many North American species. Also included are the large dobson-flies (*q.v.*), belonging to the family Corydalidae and found in North and South America and parts of the old world. Smaller members of the same family are often known in America as fish flies (*q.v.*). (2) The Raphidiodea or snake flies (*q.v.*) are distinguished by the elongate prothorax and by the very long ovipositor in the female. They are terrestrial insects whose larvae are found under the bark of trees. Twenty species are found in North America (1945) and four species of the genus *Raphidia* occur in Britain.

SUBORDER II. PLANIPENNIA

Veins with evident forking at the margins of the wings; vein Rs usually with numerous branches. Larvae with piercing mouth parts; pupae enclosed in a cocoon.

Included here are the major portion of the Neuroptera: they are nearly all terrestrial insects, only a small number being partially or truly aquatic in their larval stages. The Planipennia are divided into 16 families of which only the most important are mentioned.

The Ithonidae or moth-lacewings are confined to Australia: they are large, stoutly built, mothlike insects with primitive venation. Their larvae live in the soil where they prey upon those of chafer beetles, to which they bear a close general resemblance. The Hemerobiidae or brown lacewings are widely distributed and



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)
FIG. 1.—A GREEN LACEWING (CHRYSOPIDAE)

fairly numerous in species. Their larvae along with those of the Chrysopidae or green lacewings (fig. 1) roam about vegetation preying upon aphides, mites, thrips and other soft-bodied insects (*see* Lacewing-fly). The Osmylidae and Sisyridae have aquatic larvae: the insects of the first mentioned family are medium to large-sized species which differ from the lacewings in certain venational characters. *Osmylus fulvicephalus* is the largest British neuropterous insect and occurs locally along the borders of streams where there is dense vegetation. The Sisyridae differ in having very few cross veins to the wings besides being much smaller in size. They are brown or fuscous insects found along

the borders of rivers which contain the fresh-water sponge upon which their larvae feed and live. Three species of *Sisyra* occur in Great Britain and this genus, along with *Climacia,* is found in the United States. The Mantispidae or mantis flies (*q.v.*) are easily distinguished by the elongate thorax and the prehensile fore legs which resemble in form those of the common mantis (*q.v.*) and are likewise used for seizing other insects which serve as their prey. The larvae of the European *Mantispa styriaca* are predacious upon young *Lycosa* spiders and during development they undergo striking changes of form constituting hypermetamorphosis. The family is mainly tropical but ranges into southern Europe and a few species occur in the United States. The Psychopsidae have very broad, rounded wings supported by a stout "mid-rib" and with a densely reticulated venation. Many are insects of striking beauty and their larvae have been found beneath bark of trees. The family has a wide discontinuous range occurring in South Africa, Tibet, China and Australia. The Nemopteridae (fig. 2) differ from all other Neuroptera in having very long threadlike or ribbonlike hind wings. Their larvae occur in caves on the floors of buildings among debris, etc., where they prey upon smaller forms of insect life. The family occurs in many of the warmer parts of the world including southern Europe but is absent from North America. The Myrmeliontidae or ant-lion flies (*q.v.*) bear a general resemblance to dragon-flies and have short knobbed feelers. Although most abundant in the warmer parts of the world, several species occur in Europe, one being found as far north as Sweden, but none are found in the British Isles: about 65 species inhabit the United States. Their larvae live on the ground where some make pitlike snares for entrapping their prey, while others hide away under stones or debris. The Ascalaphidae are closely related to the preceding family but can easily be separated by their much longer antennae as well as by venational differences. Their larvae either hide away on the ground or live concealed on the bark of trees. They are chiefly tropical insects, only a few species occurring in southern Europe and North America. The Coniopterygidae, or mealywings (*q.v.*), number about 50 species and are the smallest and most aberrant of all Neuroptera. They are covered with a white powdery secretion, their wings have comparatively few veins and the hind wings are much reduced in size. Their larvae roam about plants, preying upon aphides, scale insects and mites. Rather more than half a dozen species are found in Great Britain and a similar number occur in the United States.

FIG. 2.—NEMOPISTHA IMPERATRIX (NEMOPTERIDAE)

Natural History (fig. 3).—The eggs of Neuroptera are ovoid and in several families, including the green lacewings, the female exudes a sticky secretion which she draws out into a hairlike stalk upon which the egg is laid for safety. The larvae, with few exceptions, are terrestrial or arboreal and in the Planipennia they are all characterized by the greatly drawn out mandibles and maxillae which are used for seizing and perforating the prey. The mandibles are grooved along their ventral surface and the maxillae, which closely resemble them in form, fit one into each groove: in this way the two sets of appendages function as a pair of tubes through which the body juices of their victims are sucked out. Larvae of the Planipennia are further remarkable for the fact that six out of their eight Malpighian tubes become transformed into silk glands, the silk being emitted through an anal spinneret. The larvae of all Neuroptera are carnivorous and mostly prey upon other forms of insect life. When fully fed those of the Planipennia construct silken cocoons and, prior to the emergence of the perfect insect, the pupa cuts open the cocoon with its mandibles and, being mobile, often travels some little distance before the imago emerges. Little is definitely known respecting the specific nature of the food of the perfect insects: many are nocturnal in habits and are attracted to lights, while most of the day-flying species are rarely seen on the wing.

Geographical Distribution.—Certain families of Neuroptera are nearly world-wide in their distribution, the Chrysopidae, for example, being found in almost all extensive areas of land excepting New Zealand: the Sialidae have an almost world-wide though discontinuous range, while the Raphidiidae are mainly restricted to the northern hemisphere. Several families, on the other hand, are almost confined to Australia which has a more complete and diverse fauna of Planipennia than any other region of the globe, although the Megaloptera are only represented there by a few species. Only 7 families of Neuroptera occur in the British Isles and 13 families are found in the United States.

Geological Distribution.—The Megaloptera are evidently an archaic group but their fossil remains, unless very perfect, are difficult to identify. The earliest undoubted remains of this suborder have been found in the Permian rocks of Russia. The Planipennia first appear as fossils in Lower Permian beds of Kansas, where they are represented by the genus *Permoberotha.* They also occur in Upper Permian strata of the U.S.S.R. and Australia.

FIG. 3.—LIFE CYCLE OF BROWN LACEWING (HEMEROBIUS STIGMA)

Economic Importance.—Neuroptera as a whole are distinctly beneficial to man in their larval stages. Larvae of the Sialidae form food for trout and other fishes, while those of the Planipennia prey upon many soft-bodied noxious insects. In Europe and North America the most beneficial families are the Hemerobiidae, Chrysopidae and Coniopterygidae, and in Australia larvae of the

Ithonidae destroy numbers of Scarabaeid grubs in the soil.

BIBLIOGRAPHY.—For the British species consult F. J. Killington, "Monograph of the British Neuroptera," Ray Society (London, 1936–37). Accounts of the larvae are given by C. L. Withycombe, *Trans.* Ent. Soc. (London, 1924), pts. 3–4 (1925). The Australian forms are discussed by K. C. McKeown in "Australian Insects," *Australian Zoological Handbook no. 6,* Royal Zool. Soc. (New South Wales, 1942); R. J. Tillyard, *The Insects of Australia and New Zealand* (Sydney, 1926). For the North American Neuroptera consult the following: Raphidiodea, F. M. Carpenter, *Proc. Amer. Acad. Arts and Sci.,* vol. 71, no. 2 (1936); Sialidae, H. H. Ross, *Illinois Natural History Survey Bull.,* vol. 21, art. 3 (1937); Mantispidae, J. Rehn, *Trans. Amer. Ent. Soc.,* vol. lxvi (1939); Myrmeleontidae, N. Banks, *Bull. Mus. Comp. Zoology,* vol. 68, no. 1 (1927); Hemerobiidae and related families, F. M. Carpenter, *Proc. Amer. Acad. Arts and Sci.,* vol. 74, no. 7 (1940); Chrysopidae, R. C. Smith, *Mem. 58, Cornell Univ. Agric. Exp. Sta.* (1922). (A. D. I.; F. M. Cr.)

NEUSALZ, a town in the Prussian province of Silesia, Germany, on the Oder, 20 mi. by rail N.W. of Glogau. Pop. (1939) 17,108. Neusalz became a town in 1743. Its largest industry is, perhaps, the manufacture of thread; there are also in the town ironworks, breweries, shipbuilding yards and electrical works. Lignite is mined in the neighbourhood and chemicals manufactured.

It developed trade because of its numerous rail and river connections.

NEUSS, a town in the Prussian Rhine province, Germany, 4 mi. W. of Düsseldorf and 1½ mi. from the west bank of the Rhine, with which it is connected by the Erft canal. It lies at the junction of lines to Cologne, Viersen, Zevenaar (the Netherlands), Düsseldorf, Düren and Rheydt. Pop. (1939) 60,506, of whom the majority were Catholics. Neuss, the *Novaesium* of the Romans, mentioned by Tacitus, formerly lay close to the Rhine. Drusus, brother of the emperor Tiberius, threw a bridge across the Rhine here, and his name is preserved in the Drusustor, the lower half of which is of Roman masonry. In 1474–75 Charles the Bold besieged the town in vain for 11 months, but it was taken and sacked by Alexander Farnese in 1586. Extensive excavations have been made and many Roman treasures have been unearthed.

The church of St. Quirinus is a fine example of the transition from the Round to the Pointed style. The town hall was built in the 17th and altered in the 18th century.

NEUSTADT (Polish, *Prudnik*), a town in the Prussian province of Silesia, Germany, on the river Prudnik, 60 mi. by rail S.E. of Breslau. Pop. (1939) 17,244.

NEUSTADT-AN-DER-HAARDT, a town of Germany, in the Bavarian Palatinate, situated under the eastern slope of the Haardt mountains and at the mouth of the valley of the Speyerbach, 14 mi. W. of Speyer, and at the junction of railway lines to Worms, Weissenburg and Kaiserslautern. Pop. (1939) 24,481. Neustadt is one of the centres of the Rhenish grape cure. It does a large trade in wines and is often called Neustadt-an-der-Weinstrasse.

NEU-STETTIN, a town in the Prussian province of Pomerania, Germany, on the small Streitzig lake, 90 mi. by rail E.N.E. of Stettin, at the junction of railways to Belgard, Posen and Stolpmünde. Pop. (1939) 19,946. Neu-Stettin was founded in 1313 by Wratislaus, duke of Pomerania, and is commercially important.

NEU-STRELITZ, capital of the former German republic of Mecklenburg-Strelitz, situated between the Zierker See and the Glambecker See, 60 mi. N. of Berlin, on the railway to Stralsund, at the junction of lines to Warnemünde and Wittstock. Pop. (1939) 26,225. Neu-Strelitz was not founded till 1726. The former ducal residence is a pseudoclassical edifice, with a library.

About 1½ mi. to the south lies Alt-Strelitz (pop. 4,820), the former capital of the duchy.

NEUSTRIA, the old name for the western kingdom of the Franks, as opposed to the eastern kingdom, Austrasia (*q.v.*). The most ancient form of the word is *Niuster,* from *niust,* which would make the word signify the "most recent" conquests of the Franks. The word Neustria does not appear in Gregory of Tours, but is found for the first time in Fredegarius. Under the later Merovingian kings the princes reigning in the west were called kings of Neustria, and those reigning in the east, kings of Austrasia. Under the new Carolingian dynasty, the word Neustria was restricted to the district between the Loire and the Seine, together with part of the diocese of Rouen north of the Seine; while Austrasia comprised only the Frankish dominions beyond the Rhine, together, apparently, with Mainz, Worms and Spires on the left bank. The districts between Neustria and Austrasia were called *Media Francia* or simply *Francia.* In 843 Brittany took from Neustria the countships of Rennes and Nantes; and gradually the term Neustria came to be restricted to the district which was later called Normandy. By a similar usage, the term Neustria was applied in Italy in the 8th century to western Lombardy.

See F. Bourquelet, "Sens des mots France et Neustrie sous le régime mérovingien," in the *Bibliothèque de l'école des chartes,* vol. xxvi, pp. 566–574; A. Longnon, *Atlas historique de la France.*

NEUTRALITY has been defined as the legal status arising from the abstention of a state from all participation in a war between other states, the maintenance by it of an attitude of impartiality in its dealings with the belligerent states, and the recognition by the latter of this abstention and impartiality. From this legal status arise the rights and duties of neutral and belligerent states respectively. Under the conception of absolute sovereignty prevalent before World War I one state might go to war with another for a good or bad reason, or for no reason at all, and a violation of international law by one state was regarded as no concern of any other, except that immediately affected by such violation. With the creation of the League of Nations and the ratification in 1928 of the Paris pact for the renunciation of war, the concept of permissive sanctions or nonbelligerency arose. States asserted a privilege to manifest varying degrees of partiality toward the warring parties, stopping short of war, and ceased to observe the duty of impartiality. Though the United Nations charter sought to change the privilege of neutrality to a duty to support collective sanctions against aggressor states, it seemed likely that the legal status of neutrality would remain an important problem in international law.

Rights and Duties of Neutrals.—These may be subdivided into the rights and the duties of neutrals; and the rights and liabilities of trade. A neutral state is entitled to have the integrity of its territory and territorial waters respected by all the belligerents. Consequently, belligerents may not use a neutral's territory as a base of operations or engage in hostilities therein. The privilege of the inviolability of its territory is accompanied by a duty to prevent therein acts by belligerents in derogation of its sovereignty. It is entitled to use, and must use, the means at its disposal, including measures of force if necessary, to prevent within its territory the commission of any act which, if tolerated, would constitute a nonfulfilment of its neutral duty. It is also entitled to exact compliance by belligerents with its own municipal regulations, designed to maintain its neutrality and to perform its international obligations. If such regulations are enforced equally upon all the belligerents, they are not to be regarded as hostile or unfriendly. It is entitled to maintain its diplomatic intercourse with other neutral states and with the belligerents alike, except for such temporary interruptions as may be demanded by military necessity. It is entitled to offer its good offices or mediation to the belligerents with a view to the cessation of hostilities without the exercise of this right being regarded as an unfriendly act (*Hague Convention, I,* 1907). Finally it is entitled to require belligerents not to interfere with the commercial intercourse of its subjects, unless such interference is warranted by international law.

Duties of Neutral States.—The primary duty of a neutral state is strict impartiality in its relations with both belligerents, whether such impartial conduct is obligatory or discretionary. There must not be any discrimination or preference. Even a favour granted to one must be extended to the other. A neutral state must not allow a belligerent to move troops, munitions of war or supplies across its territory or to erect or use therein wireless or other telegraphic apparatus for military purposes. It must intern belligerent forces which have taken refuge in its territory, but may leave at liberty escaped prisoners of war and permit the passage of the sick and wounded belonging to the belligerent forces (*Hague Convention, V,* 1907). It must not allow any act of war, including the exercise of visit and search or

capture, to be committed by a belligerent within its territorial waters. It must release a prize so captured with its officers and crew and intern the prize crew. It must not allow a prize court to be established on its territory nor on a vessel within its territorial waters. It must not allow either belligerent to use territory or territorial waters as a base of military operations against its adversary, nor may it furnish either belligerent with troops, ships, munitions of war, money or with commodities of direct or indirect use in the war. It must use due diligence in preventing the fitting out or arming of vessels within its jurisdiction and the departure of vessels intended to engage in hostile operations; the issue of commissions by either belligerent or the enlistment of men (*Hague Convention, XIII*, 1907).

Rights and Liabilities of Neutral Trade.—Restraint on neutral trade with belligerents rests upon a compromise between two conflicting principles. On the one hand the subjects of a neutral state contend that they are entitled to carry on their normal trade with either belligerent, provided such trade is not directly calculated to prejudice the military operations of one belligerent, nor to promote those of the other. On the other hand a belligerent state claims that the subjects of a neutral state are not entitled to supply his enemy with commodities which are of direct and indirect use to his enemy in the conduct of the war. Between these two contentions there have been great divergencies both in theory and practice. A state is apt to take a different view when belligerent from that which it maintained as a neutral. But upon one matter there is no difference of opinion. It is generally recognized that it is for the belligerent and not for the neutral state to enforce the restraints on neutral trade; that it is the duty of the neutral state to acquiesce in such restraints in so far as they are not unwarrantable; and that the violation of such restraints by the subjects of a neutral state are not criminal and only involve the perpetrators in the seizure and loss of their property. The most important restraints on neutral trade are those imposed by the rules relating to blockade (*q.v.*), pacific blockade (*q.v.*), contraband (*q.v.*), continuous voyage, convoy (*q.v.*), unneutral service, and visit and search (*q.v.*).

Neutrality in World War I.—At the outbreak of World War I the warring powers qualifiedly announced their acceptance of the rules of naval warfare as laid down in the Declaration of London of 1909 but subsequent modifications of the declaration in practice eventually rendered it insignificant. The U.S. government accordingly took the position that it would in any event demand that its rights under existing rules of international law and treaties be respected. Resort by the German government to the laying of mines and submarine warfare and by the British government to a system of blockade, rationing, requisitioning and black lists resulted in a vast disruption of neutral rights of trade. The loss of life as well as of property caused by Germany's methods of naval warfare finally led to U.S. intervention on behalf of the Allies.

Basic Concepts of Neutrality.—The developments in neutrality occurring between World War I and World War II were concerned with what had hitherto been regarded as two essential characteristics of neutrality, its voluntary and its absolute quality. First, it was conceived to be a voluntary status in the sense that each state had the sovereign right to abstain or to take part in the hostilities as it might see fit. Second, it was conceived to be absolute in the sense that the neutral state must refrain from any form of participation in the hostilities and any manner of assistance to one of the belligerents.

Neutrality as a Voluntary Status.—In his war message of April 2, 1917, Pres. Woodrow Wilson declared that "neutrality is no longer possible or desirable when the peace of the world is involved and the freedom of its peoples." The council of the League of Nations amplified this thought in Sept. 1920, when it said: "The idea of neutrality of members of the League of Nations is not compatible with the other principle that all the members of the League will have to act in common to cause their covenants to be respected." The members, subject to certain qualifications, solemnly agreed not to resort to war. From this fact arose the question as to whether the obligation to apply sanctions to a member who had resorted to war in disregard of its covenants made the status of neutrality impossible for League members. The assembly concluded on Oct. 4, 1921, after a study of the question, that "the unilateral action of the defaulting state cannot create a state of war; it merely entitles the other Members of the League to resort to acts of war" against the covenant-breaker. The members were not compelled to take such action; each member could "decide for itself whether a breach of the Covenant has been committed." The Pact of Paris of 1928 raised the problem whether non-League members who had signed or adhered to the treaty were thereby precluded from assuming the status of neutrality upon a violation of the treaty by another state party thereto. It was generally felt, however, that the pact did not eliminate neutrality and that each state was privileged to decide for itself whether or not it would ignore a breach of the treaty.

Doctrine of Permissive Sanctions.—A group of jurists, sometimes referred to as the sanctionist school, developed the view that the covenant of the League and the principles of the Pact of Paris, if they did not create the duty, at least created the privilege to discriminate against aggressors. It was advanced that those states who had resorted to war in breach of their treaty obligations were no longer entitled to claim the benefits of impartial conduct as against third parties. Nonbelligerents who had suffered such a breach of treaty obligations were permitted to apply sanctions short of war against the aggressor; the former obligation to be neutral, *i.e.*, impartial, no longer applied. The International Law association, meeting in Budapest, Hungary, in 1934, suggested that a state resorting to war in violation of the pact could not require from other parties thereto observance of the traditional obligations of neutrality. In other words, as between parties to the pact, a nonbelligerent was free, though not obliged, to refuse to a violator of the pact the benefits of impartial treatment.

U.S. Neutrality Legislation Prior to World War II.—The obligations of a neutral state under international law are the same for all nations. A number of nations, including Great Britain, the United States and France, have endeavoured to enforce their obligations under international law through their municipal statutory penal law. This statutory law in the United States is known as the "neutrality laws." In Great Britain the statutory provisions are found in the Foreign Enlistment acts. Such domestic legislation may impose more stringent obligations than those required by international law. In the neutrality legislation of the United States in 1935 and 1937, and to a lesser extent in 1939, a more severe standard of neutral conduct was imposed.

The United States neutrality legislation of the 1930s was a complex of the views of three schools of thought. It was the view of the noninterventionist or isolationist school that war could be avoided by avoiding economic and other contacts with those engaged in hostilities. This view resulted in the embargo and cash-and-carry provisions of the 1937 act whereby (1) the president was empowered, through proclamation, to make it unlawful to export arms, ammunition and implements of war, as determined by him, to the belligerent states named by him, and (2) other trade with the belligerents could be prohibited by the president unless title to the goods was first transferred to the belligerent and the belligerent transported such goods in other than U.S. ships.

The sanctionist school, with its view that impartiality was no longer obligatory as against an aggressor, succeeded to a certain extent in granting discretionary power to the president in enforcing the act by making its operation dependent on a finding that a state of war existed, a discretion which Pres. Franklin D. Roosevelt used in the Chinese-Japanese conflict by failing to make such a finding.

The traditional school of neutrality sought to preserve the requirement of equal and impartial treatment to both belligerents. The Neutrality act approved Nov. 4, 1939, relaxed the embargo on arms, ammunition and implements of war and permitted any foreign transferee of title to remove its own acquisitions of such munitions from U.S. territory. It also empowered the president

to proclaim the existence of combat areas into which U.S. citizens or vessels might not enter. The cash-and-carry and the combat area provisions were eliminated by an act approved Nov. 17, 1941, just prior to Pearl Harbor.

Transfer of Destroyers to Great Britain.—With the German occupation of France and the Low Countries in 1940, the entry of Italy into the war as a belligerent, and the success of German naval warfare over wide areas adjacent to the English channel and the North sea, the United States was confronted with the question of whether maintenance of its traditional neutral attitude of impartiality would not result in the fall of Great Britain and impair the ability of the United States successfully to defend itself. Accordingly, pursuant to an executive agreement of Sept. 2, 1940, 50 over-age U.S. destroyers were transferred to Great Britain in exchange for leases of valuable naval and air bases on British territory in the western hemisphere. Though some opinion sought to justify the transfer as a permissive sanction against an aggressor, other U.S. authorities considered it clearly to be "a violation of our neutral status, a violation of our national law, and a violation of international law."

Lend-Lease Act.—The continuing successes of the axis powers in World War II led to the enactment by the United States on March 11, 1941, of the Lend-Lease act, whereby the president was given full discretion to determine that the defense of any specific country was vital to that of the United States. The president was authorized to manufacture in government arsenals, factories and shipyards, or otherwise procure, defense articles for the government of any such country, "and to sell, transfer title to, exchange, lease, lend or otherwise dispose of, to any such government any defense article." The requirements of self-defense and the doctrine of permissive sanctions were used to justify this otherwise manifest departure from traditional neutrality.

Freezing and Export Controls.—Beginning April 10, 1940, the freezing control of assets of countries invaded and occupied by the axis was begun as a protective measure for such countries. On June 14, 1941, freezing control was extended to the remaining countries of Europe, including Germany and Italy, and on July 26, 1941, to Japan, thereby frankly becoming another instance of application of sanctions. This control involved the prohibition of all transactions in the property of such countries subject to U.S. jurisdiction except under licence. The freezing control was used in conjunction with a system of export controls, including successively the "moral embargo" of 1938 on shipments of aircraft, etc., to countries bombing civilian populations, the Export Control act of July 2, 1940, under which aviation gasoline, steel and iron scrap were embargoed to Japan, and the black-listing, beginning July 17, 1941, of persons and firms in American republics whose activities were believed to be unfriendly to American interests.

Seizure of Foreign Ships in U.S. Ports.—By act of June 6, 1941, the president was authorized to requisition any foreign merchant vessel lying idle in U.S. waters. Italian, Danish and Finnish vessels were the most numerous of those seized under this act. The effect of all the foregoing measures was an abandonment by the United States of its traditional principles of neutrality prior to World War II and an acceptance in its place of the emerging doctrine of nonbelligerency or permissive sanctions. From the standpoint of Germany and Italy, however, they could be regarded as *causae belli,* and were mentioned in the German declaration of war as a violation of the rules of neutrality.

Declaration of Panama.—The Declaration of Panamá signed Oct. 3, 1939, by the representatives of the 21 American republics proclaimed a noncombat zone extending to nearly 300 mi. of the high seas adjacent to the western hemisphere. The measure was sought to be justified as an exercise of protective jurisdiction to protect their neutrality. The declaration was put to the test in the British victory over the "Admiral Graf Spee" off Montevideo, Uruguay. Though the American republics protested this action in a joint statement of Jan. 1940, Great Britain replied that it could not be deprived of its belligerent rights by unilateral action and that it had clearly acted within such rights when they were exercised beyond the three-mile limit.

Neutrality During and After World War II.—World War II presented sufficient instances involving the discharge of neutral duties by Sweden, Spain, Turkey and Argentina, and as between Japan and Russia, that the utility of the traditional rules of neutrality was shown not to be outmoded. They did furnish a standard by which the relations between a weak neutral and a relatively powerful belligerent could be judged. But with the acceleration of the world to a bipolar power system after World War II, the United States and the U.S.S.R. being the respective centres thereof, the possibilities of the abstention of any state from any further major war seemed slight and the value of neutrality as a means of localizing the infections of war remote. It seemed probable that the alignment of interests thus brought about would manifest itself either in direct participation in wars, or in the assumption of the status of nonbelligerency (partiality) with regard thereto, instead of classic neutrality (impartiality). Such policies would profess to be given legal justification on the basis of a collective imposition of sanctions but, in the absence of the universality of the application of such a system through world-wide support of the United Nations, it might be questioned whether any such regional or limited system of collective interference would become international law, in the correct sense of that term.

In so far as the United Nations was concerned, the powers of the Security council, coupled with the agreement of the members to accept and carry out its decisions, represented a long step toward the compulsory imposition of collective sanctions against aggressors. However, decisions of the Security council in this respect were subject to the veto, which might prevent the obligation from ever arising, and were further subject to the working out of special agreements for the furnishing of military aid under article 43. (*See* also BLACK LIST.)

NEUTRON, a particle in the atomic nucleus (*q.v.*) which has no electric charge. The neutron has a mass very nearly equal to that of a proton, the nucleus of the hydrogen atom. The neutron and the proton are believed to be the fundamental building stones of which all atomic nuclei are composed.

History.—The neutron was discovered only recently, even by standards of atomic physics. Its existence was first postulated by Lord Rutherford in 1920 as a helpful concept in understanding the structure of atomic nuclei. It was experimentally discovered in 1932 by Sir James Chadwick at the Cavendish laboratory in Cambridge, Eng. Earlier in the same year, Frédéric Joliot and Mme. Irène Joliot-Curie in Paris had investigated a certain radiation emitted by beryllium when bombarded by alpha particles from radioactive substances. They found that this radiation which had previously been interpreted as a gamma radiation (*see* RADIOACTIVITY, ARTIFICIAL), was capable of propelling hydrogen nuclei (protons) with very high speed which was incompatible with its supposed nature. Chadwick, after a very thorough experimental investigation of all the properties of the new radiation, came to the conclusion that it must consist of neutral particles of a mass very nearly equal to that of the proton. The major argument in this conclusion was the speed given by the newly discovered particle to various atomic nuclei in collisions. This new particle was named neutron.

It was soon found that neutrons are particularly effective in causing nuclear transformations (*see* ATOM; NUCLEUS); this is because of their lack of electric charge. In 1934 Enrico Fermi and his collaborators showed that nearly every element in the periodic table will undergo a nuclear transformation when bombarded by neutrons. In very many cases, radioactive isotopes (*q.v.*) of the elements are formed in this way. Slow neutrons were found particularly effective in producing many of these transformations.

Among the elements in which neutron bombardment induced

radioactivity Fermi found also uranium. This element was investigated in greater detail by Lise Meitner and Otto Hahn in Berlin in subsequent years. Their results were very difficult to interpret, until late in 1938 Hahn and F. Strassmann found that at least one of the radioactive elements formed in uranium was an isotope of barium. This was immediately interpreted by Otto Frisch and Meitner (also two weeks later and independently, by Hahn and Strassmann themselves) as indicating that the uranium nucleus had been split into two almost equal parts, a process which they called fission. The important technical developments resulting from this discovery will be described in the last section of this article.

Properties of Free Neutrons.—It is most appropriate to discuss the properties of the neutron by comparing them with those of its counterpart in the atomic nucleus, the proton.

The neutron, as already mentioned, has no electric charge, whereas the proton has one positive elementary charge (4.8×10^{-10} electrostatic units). This causes great differences in the passage of the two particles through matter: the proton ejects electrons from atoms which it encounters, and thereby produces heavy ionization along its path. Because of this, the track of a proton can easily be observed in a cloud chamber. The neutron, having no electric charge, can not produce ions but can only make direct collisions with atomic nuclei. Its track can, therefore, not be observed; but the presence of neutrons can only be deduced from the recoil nuclei which have been set in motion by collisions with neutrons. The tracks of these nuclei, which are electrically charged, can be observed in a cloud chamber (see *Detection of Neutrons* below).

Another consequence of the absence of ionization is that neutrons do not lose any of their velocity so long as they do not collide with atomic nuclei. Since such collisions are very rare, a neutron will travel very far before losing its speed. Protons, on the other hand, can travel only very short distances because they lose their energy by ionization. For instance, a proton with a velocity of 3×10^9 cm./sec., which is the order of magnitude of the velocities common in nuclear physics, will travel about 0.005 cm. in a material such as iron or copper. A neutron of the same velocity will travel about 5 cm. before it makes its first collision with a nucleus; and since it loses only a fraction of its energy in this collision, it will continue to travel for 10 to 100 times this distance before it is finally captured by a nucleus. Neutrons are, therefore, very penetrating.

Mass.—The mass of the neutron is very nearly the same as that of the proton. In the physical scale of atomic weights (in which the isotope O^{16} has a mass of exactly 16), the mass of the neutron is 1.00898. On the same scale, the mass of the hydrogen atom is 1.00814 and that of the proton 1.00759. The neutron is, therefore, slightly heavier than the proton and even slightly heavier than the hydrogen atom.

This fact has two important consequences. First of all it makes the neutron unstable against beta disintegration (*see* below). If the neutron were lighter than the hydrogen atom, the latter would be unstable. Since this is in contradiction with the known existence of hydrogen on earth and elsewhere, it follows that the neutron must be heavier than the hydrogen atom.

The second consequence is that the neutron can not be considered as a proton and an electron bound together in some way. If two particles are bound together, then, according to the Einstein relation, $E=mc^2$, the mass of the combination must be less than the sum of the masses of the parts (see *Neutrons as Building Blocks of Nuclei*, below). Therefore, the neutron and the proton have to be regarded as fundamental particles which are closely related to each other in a manner whose details are still unknown.

Spin, Magnetic Moment and Statistics.—Just like the more familiar fundamental particles, the electron and the proton, the neutron has a "spin"; *i.e.*, it has properties which are analogous to those of a spinning top. The value of the spin measured in units of Planck's constant is one-half, just as for proton and electron. It also shares with proton and electron the property of obeying Fermi's statistics, which makes it impossible for two neutrons to be in the same quantum state. The value of the spin and the fact that neutrons obey Fermi statistics are further arguments against the interpretation of the neutron as a combination of electron and proton.

The neutron also has a magnetic moment whose direction is opposite to that of its spin, as if a negative electric charge were revolving in the rotation of the spinning top. The value of the magnetic moment has been measured with great accuracy and is 1.9128 nuclear magnetons. The proton has a positive magnetic moment (as if a positive charge were revolving) whose value is 2.7928 nuclear magnetons. The magnetic moment of the electron is negative and is one Bohr magneton (1,840 nuclear magnetons), as predicted by Paul A. M. Dirac's theory. No theory had been developed by 1953 which explained the magnitude of the magnetic moments of neutron and proton.

Beta Decay.—According to the theory of radioactive beta decay (*see* RADIOACTIVITY, NATURAL), the fundamental process taking place in every beta decay is the transformation of a neutron into a proton plus an electron plus a hypothetical particle without charge, the neutrino. This fundamental process was first observed in 1949. A. H. Snell and collaborators at the Oak Ridge, Tenn., National laboratories detected the simultaneous occurrence of a proton and an electron coming from the decay of neutrons in a high intensity beam issuing from the chain-reacting pile (see *Atomic Energy* below). In 1950 John M. Robson at the Chalk River Atomic Energy project in Canada observed the decay of the neutron and the half life (time after which the original number has decreased to one-half) and also measured the energy spectrum of the decay electrons. He observed the heavy particles resulting from the decays in a sensitive mass spectrometer and showed that they were protons. The negative particles in coincidence with the protons were detected in an electron spectrometer which measured the electron energy. The spectrum obtained in this manner is in good agreement with the predictions of beta-decay theory. The observed maximum energy of the decay electrons gives a value for the mass of the neutron which compares very well with the more accurate measurements (*see* above) made from observations on nuclear transmutations in which all the masses and energies, except the neutron's mass, are known.

Free neutrons decay according to the usual laws of radioactive decay. Robson's measurements enabled him to deduce a value for the half life of the neutron decay of 13 min. This is also in excellent agreement with the value estimated from the theory of beta decay.

Neutrons as Building Blocks of Nuclei.—According to present theory, any nucleus is composed of neutrons and protons. This theory has replaced the older one, held until 1932, that protons and electrons were the building stones of the nucleus. This older theory had encountered grave difficulties. The most striking, perhaps, was that electrons never come out of atomic nuclei in collisions. Moreover, according to quantum mechanics, electrons cannot be compressed into such a small space as the inside of a nucleus. Additional arguments were the spin and the statistics of atomic nuclei, and the peculiar phenomena connected with beta radioactivity. The electron-proton hypothesis has been completely discarded.

The proton-neutron hypothesis has however met with considerable success and has been used to explain a number of fundamental properties of atomic nuclei. It is fairly well established that protons and neutrons can be treated inside the nucleus by the ordinary laws of quantum mechanics.

According to the proton-neutron hypothesis the atomic number Z (charge) of a nucleus is equal to the number of protons contained in it. The mass number A, *i.e.*, the integer nearest to the atomic weight, is the sum of the numbers of protons and neutrons since each of these particles contributes about one unit of atomic weight. The isotopes of a given element, therefore, all contain the same number of protons but varying numbers of neutrons; for instance, any isotope of the element carbon contains 6 protons, the most abundant isotope C^{12} contains in addition 6 neutrons, whereas the less abundant stable isotope C^{13} contains 7 neutrons.

Perhaps the most important information about a nucleus is provided by its exact weight. From it the binding energy of the nucleus can be deduced, with the help of Einstein's relation, $E=mc^2$. For instance, the helium nucleus has a mass of 4.00285. Since its atomic number is 2 and its mass number 4, it contains 2 neutrons and 2 protons; the combined weight of these 4 particles is 4.03314. The difference between this and the weight of the helium nucleus represents the force (more precisely, the energy) with which the 4 particles are held together in the nucleus. Because of the large value of the velocity of light, *c*, the energy represented by this mass difference is tremendous. The formation of 4 gr. of helium from 2 gr. of hydrogen and 2 gr. of neutrons releases as much energy as the burning of about 100 tons of coal.

A binding of this tremendous strength can not be because of electric forces; moreover, no such forces could act on neutrons anyway, because of the absence of electric charge. Gravitational forces are even more inadequate to account for the tight binding. A new force must therefore be assumed which is known as nuclear force. The exact character of nuclear forces is not known; but it is known that they act only over very short distances, having a range of about 3×10^{-13} cm. and being negligible outside this range. The exploration of nuclear forces is the prime objective of nuclear physics, and neutrons have proved to be most valuable tools in this research. The scattering of neutrons of various velocities by protons has given the most fundamental information about nuclear forces.

Neutron Production.—Since the neutron is not stable (see *Properties of Free Neutrons*, above, and *Nuclear Reactions Produced by Neutrons*, below), no neutrons are found in nature in the free state, *i.e.*, outside of atomic nuclei. Therefore, if an experimenter wishes to work with neutrons, he must produce them in his laboratory by means of nuclear reactions. These reactions fall into three types: (a) reactions initiated by a light nucleus, such as the nucleus of light or heavy hydrogen or helium, commonly called proton, deuteron and alpha particle, respectively; (b) reactions initiated by gamma-rays (electromagnetic radiation); (c) nuclear fission.

Reactions Produced by Charged Particles.—This type of reaction was historically the first method to produce neutrons and, until 1942, the only way to produce them in quantity. It is still the most versatile method, being capable of producing neutrons of specified kinetic energy. Chadwick, in his first experiments, obtained neutrons by bombarding beryllium or boron with alpha particles. Nowadays, neutrons are mostly produced by bombarding various atomic nuclei with deuterons and sometimes with protons which are accelerated in a cyclotron or some similar device. This has the advantage that the number of particles obtainable from accelerating devices is very much greater than the number of alpha particles emitted by available amounts of radioactive material. Particular nuclear reactions useful for the production of neutrons will be discussed below.

Yield.—One of the prime considerations for choosing a particular nuclear reaction for the production of neutrons is the yield. This depends sensitively on the kinetic energy (velocity) of the bombarding particle, and on the nature of the bombarding particle as well as of the target nucleus. The bombardment of beryllium with deuterons gives in general a higher yield than any other combination of nuclei. However, even for this reaction, the yield is very small and changes rapidly with the energy of the deuterons: At 1 Mev. (million electron volts) deuteron energy, it is about 1 neutron for 100,000 deuterons; at 10 Mev., about 1 in 1,000, and further increase of the deuteron energy to 40 Mev. is expected to increase the yield to about 1 in 100. The yields are so small because the deuteron loses kinetic energy continuously by ionizing the atoms of beryllium through which it passes, and in general it will have lost all its energy before it has had a chance to hit a beryllium nucleus and disintegrate it. A good cyclotron may give a current of deuterons of about 100 microamperes; if the deuteron energy is 10 Mev., this will produce about 10^{12} neutrons per second.

The yield from the bombardment of beryllium with alpha particles is about 1 neutron for 4,000 alpha particles (if the alpha particles come from radon). One curie of radon (*i.e.*, the amount which is in radioactive equilibrium with 1 gr. of radium), intimately mixed with beryllium will give about 10,000,000 neutrons per second. An average cyclotron is equivalent in neutron production to about 100,000 curies, *i.e.*, to the radioactive rays from 100 kg. of radium.

At very low energy the yield decreases rapidly. The reason is that the incident particle (deuteron or alpha particle) can not come close to the beryllium nucleus because there is a strong electrostatic repulsion between them, because of their positive electric charges, and there is not sufficient kinetic energy to overcome this repulsion. For instance, the yield for deuterons of 500,000 electron volts (ev.) on beryllium is only 1 neutron per 2,000,000 deuterons, and at 250,000 ev. it is immeasurably small. At these low deuteron energies the yield is greater when the target nucleus has a smaller electric charge; for instance, if deuterons are used for the target as well as in the bombarding beam. If the target contains deuterium in the form of heavy ice, the neutron yield for deuterons of 500,000 ev. is about 1 in 200,000, 10 times greater than for a beryllium target, and even at 100,000 ev. it is still 1 in 10,000,000, which, though small, is easily measurable.

Neutrons can also be produced by deuteron bombardment of other light nuclei such as lithium, boron, nitrogen, etc. The yields are usually smaller by a factor between two and ten than the yields from beryllium at the same energy.

Heavy nuclei do not give appreciable numbers of neutrons when bombarded by deuterons of moderate energy because the electrostatic repulsion does not permit deuterons to enter the heavy nucleus. This makes it possible to prevent the emission of neutrons from places where it is not desired, like the top and bottom of a cyclotron tank, by lining these places with substances of high atomic weight. This device fails for deuterons of energies of about 10 Mev. or higher.

Energy Release.—In any nuclear reaction energy is either released or absorbed. When neutrons are produced from deuterons, there is normally an energy release because the proton is not very strongly bound to the neutron in the deuteron and can be bound more strongly to the target nucleus. For instance, with a beryllium target, the energy release is 4 Mev., with a deuterium target, 3 Mev. Higher energy releases are obtained from lithium or boron targets, namely 15 and 13 Mev., respectively. These targets can, therefore, be used to produce very high energy neutrons from deuterons of quite low kinetic energy, which can be accelerated by apparatus of only moderate size and cost. Still higher energy neutrons can be obtained by deuteron bombardment of the hydrogen isotope of mass 3, with an energy release of 18 Mev.; this reaction is also useful because of its high yield at deuteron energies of a few hundred thousand volts.

An important problem in experiments on fast neutrons is the obtaining of neutrons of a well-defined energy (monochromatic neutrons). In general, a nuclear reaction will give neutrons of many different energies because the residual nucleus (which remains after emission of the neutron) can be left in several different quantum states. Thus, the deuteron bombardment of boron gives, besides the fast neutron group with 13 Mev. energy release, at least 3 other groups with energy releases of 9, 6 and 4 Mev., respectively; the reaction with lithium gives neutrons of all energies below the maximum, and that with beryllium gives also many energy groups.

On the other hand, the reaction between two deuterons is satisfactory because in this case the residual nucleus (helium 3) does not have any excited quantum states. The deuteron-deuteron reaction has, therefore, been the standard reaction for producing monochromatic neutrons. The reaction between the deuteron and the hydrogen isotope of mass 3 also fulfils this criterion and does at the same time give very high energy neutrons, in contrast to the deuteron-deuteron reaction.

Neutrons can also be produced by bombarding a nucleus with protons. In this case energy is always absorbed and the reaction, therefore, begins to take place only above a certain kinetic energy of the proton, the threshold energy. Measurement of this thresh-

old energy is most valuable in making accurate comparisons between the masses of atomic nuclei and has given an accurate value of the mass of the neutron. The reaction between lithium 7 and a proton gives monochromatic neutrons with high yield, and is very valuable for the accurate study of neutrons of moderately low kinetic energy.

Neutron Production by Gamma-Rays.—Neutrons can be released from nuclei by gamma-rays, *i.e.*, by electromagnetic radiation of extremely short wave length. The energy of one quantum of gamma radiation, $h\nu$, must be greater than the energy with which the neutron is bound to the rest of the nucleus. In most nuclei this binding energy is about 10 Mev.; notable exceptions are beryllium and deuterium for which the binding energies are 1.67 and 2.23 Mev., respectively.

The yield of neutrons is very small, even for gamma-rays of high energy. This is because it is much more likely for the gamma-rays to be absorbed by producing a pair of electrons (*see* QUANTUM MECHANICS) than to be absorbed in the nucleus. Average yields are about 1 neutron for 1,000 gamma-rays if sufficient material is provided to absorb the gamma-rays completely (this requires a thickness of several centimetres of iron or about a metre of beryllium); in thin layers, the yield is proportionally less. The efficiency of gamma-rays in producing neutrons usually rises with increasing gamma-ray energy and reaches a maximum at a gamma-ray energy of about 15 to 20 Mev. per quantum.

Neutron Production by Fission.—In the fission of uranium and other heavy nuclei, neutrons are emitted. This is the basis of the nuclear chain reaction which is the most economic means of producing large quantities of neutrons.

The fission of uranium can be induced by neutrons; in each fission one neutron is absorbed whereas more than one neutron is emitted. Each of the emitted neutrons can in turn produce fission in another uranium nucleus provided (1) the neutrons are not absorbed by other nuclei, and (2) a sufficient amount of uranium is used to prevent escape of the neutrons. In this way a nuclear chain reaction is obtained in which neutrons are continuously produced in fissions and in turn cause fission in other nuclei.

There is virtually no limitation on the number of neutrons that can be produced in this way. The only practical limitation comes from the considerable amount of energy released in fission which must be dissipated. If 100,000 kw. can be dissipated, more than 10^{18} neutrons per second are produced; one such machine thus gives a neutron production equivalent to 1,000,000 cyclotrons. For experimentation one has to consider that the neutrons will be distributed over a larger area which makes their density not so much larger than that from a cyclotron. Moreover, in working with large numbers of neutrons, the health hazards must be considered.

Nuclear Reactions Produced by Neutrons.—The most important physical property of neutrons is the absence of electric charge. This enables them to approach an atomic nucleus without being repelled by its positive charge. Therefore, a neutron can enter an atomic nucleus no matter whether it is fast or slow. On the other hand, a charged nuclear particle like a proton or deuteron can enter a nucleus only when it has a sufficiently high velocity to overcome the electric repulsion; the usefulness of such a particle for producing nuclear reactions is exhausted after it has been slowed down. Accordingly, the yield of nuclear reactions produced by a charged nuclear particle is only of the order of 1 in 1,000 or less (see *Reactions Produced by Charged Particles*, above); on the other hand, the yield of nuclear reactions from neutrons is nearly 100%; almost every neutron which is produced will ultimately be captured by a nucleus and will produce some nuclear reaction.

Several types of reactions between neutrons and atomic nuclei will be discussed in the following. Which of these reactions takes place in any given collision between neutron and nucleus is a matter of chance; the probability of any given type of reaction depends on the particular nucleus with which the neutron collides, and on the velocity of the neutron. Some reactions, notably the capture of neutrons with the emission of gamma radiation, are enhanced by reducing the velocity of the neutrons while others can be initiated only by fast neutrons.

Scattering of Neutrons.—The simplest process which may occur when a neutron hits an atomic nucleus is scattering, *i.e.*, a change of the direction in which the neutron moves. This scattering may be elastic like the collision between two billiard balls; in this case, the kinetic energies of the neutron and the nucleus after the collision add up to the kinetic energy of the neutron before the collision; or the scattering may be inelastic; *i.e.*, kinetic energy may be lost and transformed into internal energy of the nucleus.

Only elastic scattering is possible in collisions between neutrons and protons (nuclei of ordinary hydrogen). In collisions with other nuclei, in general both types of scattering may occur; but if the kinetic energy of the neutron is small, again only elastic collisions are possible, because then the energy will not be sufficient to excite any of the higher energy levels of the nucleus. Depending on the particular nucleus involved, the neutron must have a minimum energy of from 0.1 to about 10 Mev. in order to make inelastic scattering possible. Once the neutron energy is above this limit, inelastic scattering becomes rapidly more important and predominates over elastic scattering when fast neutrons collide with heavy nuclei. In the majority of cases, a very large fraction of the kinetic energy is lost in inelastic collisions, so that the neutrons emerge after the collisions with an average kinetic energy of about one-quarter of their initial energy or less. The remainder of the energy has been transformed into excitation energy of the nucleus and usually appears afterward in the form of gamma-rays.

Collisions between neutrons and atomic nuclei are, of course, relatively rare because of the very small size of the atomic nucleus. This size can be determined from the frequency of collisions with fast neutrons. The frequency of collisions is commonly measured in terms of the effective cross section, *i.e.*, the target area which the nucleus appears to present to the neutron. If the cross section is σ, a thin slab of material, of thickness t and containing N nuclei per unit volume, will scatter (or absorb) a fraction

$$f = N\sigma t$$

of the neutrons incident upon it. The cross section σ is conveniently determined by measuring the fraction $1-f$, of neutrons which penetrate the slab without being deflected.

The cross sections of nuclei for collisions with fast neutrons are all of the order 10^{-24} sq.cm. This corresponds to a radius of the nucleus of about 10^{-12} cm. which confirms the result obtained from other experiments (the figure 10^{-12} is correct for the heaviest nuclei). Neutron scattering experiments further confirm that the volume of nuclei is roughly proportional to the number of particles contained in them, *i.e.*, to the atomic weight. The most important deviation from this rule is that the lightest nuclei tend to present a relatively greater cross section to neutrons of moderate energy (a few million electron volts). In solid materials neutrons travel on the average about 2 to 10 cm. between two collisions.

For the theory of nuclear forces, the scattering of neutrons by protons is particularly important. The effective cross section of the proton for slow neutrons is unusually large, namely about 20×10^{-24} sq.cm., whereas that of nuclei such as Al, Si, etc., is only about 2×10^{-24} sq.cm. The large cross section of the proton has been explained in terms of a resonance effect. At higher neutron energy, the proton cross section decreases but it is still 3×10^{-24} sq.cm. for neutrons of 2 Mev. and falls in line with heavier nuclei only at extremely high neutron energy.

Whether the scattering is elastic or inelastic, some kinetic energy will be transferred from the neutron to the nucleus. The scattering is, therefore, connected with a slowing of the neutron which will be discussed in more detail under *Neutron Diffusion*, below.

Nuclear Reactions Leading to the Emission of Charged Particles.—In many cases the collision between a neutron and a nucleus leads to a true nuclear reaction in which a nuclear particle other than a neutron is emitted. These reactions are the inverse

of the reactions in which neutrons are produced by an incident-charged particle.

Many reactions have been observed in which a proton or an alpha particle is emitted when a nucleus is bombarded by a neutron. Reactions in which a proton is produced in general absorb energy and can, therefore, be caused only by neutrons of considerable kinetic energy. There are some exceptions, the most important being the reaction $n+N^{14}\rightarrow H+C^{14}$ which releases an energy of 0.6 Mev.; this reaction is caused with considerable probability by very slow neutrons.

The reactions in which alpha particles are emitted often release energy. The most important ones of this type are the reactions of neutrons with lithium 6 and with boron 10; the cross section for these reactions is extremely great, especially for slow neutrons ($4{,}000 \times 10^{-24}$ for boron 10, 900×10^{-24} for lithium 6).

Many neutron-induced nuclear reactions lead to the formation of a radioactive nucleus, which subsequently emits a beta-ray (electron). An example is the nucleus C^{14} which results from neutron bombardment of nitrogen, and it can be shown from general arguments about nuclear stability that all reactions caused by a neutron in which a proton is emitted lead to a radioactive nucleus. If an alpha particle is emitted in the reaction, the resulting nucleus may or may not be radioactive; for instance, the reaction between neutrons and lithium 6 leads to the important radioactive isotope of hydrogen of mass 3, whereas the reaction with boron 10 gives the stable nucleus lithium 7.

Nuclear reactions can be used to detect neutrons (see *Detection of Neutrons*, below) and it is particularly useful that some reactions can be caused only by fast neutrons while others are primarily initiated by slow ones. One can observe either the charged particle (proton or alpha particle) which is emitted in the reaction itself, or one can observe the (possible) radioactivity of the nucleus formed in the reaction.

Reactions Leading to the Emission of Several Neutrons.—When a neutron of very high energy (more than 10 Mev.) hits a nucleus, 2 or more neutrons are frequently emitted from the nucleus. In the case of heavy nuclei and of neutrons of sufficiently high energy, theory shows that this is the most likely process to occur. If two neutrons are emitted, the bombarded nucleus loses one unit of weight; this results frequently in a radioactive nucleus. Reactions of this type are often useful because they provide specific detectors for neutrons of high energy.

Capture of Neutrons.—Neutrons colliding with an atomic nucleus may simply be captured and incorporated into the nucleus, the energy of binding and the kinetic energy of the neutron being transformed into the energy of one or several gamma-rays. This simple capture process can occur with any nucleus except helium 4. In many instances, neutron capture leads to the formation of a radioactive nucleus which subsequently emits beta-rays; this makes the capture easily observable and makes it possible to use this process for the detection of neutrons. The probability of capture varies greatly; it is generally greater for slow than for fast neutrons, and greater for heavy than for light nuclei. For fast neutrons and light nuclei the capture probability is immeasurably small, for heavy nuclei about 1 collision in 20 to 200 leads to capture. For slow neutrons and heavy nuclei, capture is often more probable than scattering (for instance, for one isotope of cadmium about 10,000 times!). For slow neutrons and light nuclei, scattering still predominates over capture, *e.g.*, in ordinary hydrogen in the ratio 200 to 1, and in heavy hydrogen or carbon even more strongly.

Accordingly, neutrons have very different lifetimes in different substances, the lifetime being the average time from the production of the neutron until it is captured (or causes a nuclear reaction). In solid boron, this time is about $\frac{1}{10{,}000{,}000}$ sec., in most solids of high atomic weight about $\frac{1}{10{,}000}$ sec., in such special substances as graphite it becomes more than $\frac{1}{100}$, while in gases it ranges from about $\frac{1}{10}$ sec. for air to many seconds in pure heavy hydrogen. Even the longest of these times is short compared with the time required for the neutron to emit a radioactive beta particle (13 min.) which made the latter process very hard to observe.

The capture of slow neutrons shows the interesting phenomenon of resonance. For each nucleus there exist certain characteristic values of the kinetic energy of the neutron which make the capture of the neutron very likely. For instance, cadmium absorbs very strongly all neutrons less than 0.4 ev., indium absorbs neutrons of 1.4, 4 and 9 ev., gold those of 5 ev., whereas iodine has resonances at about 20, 30 and 40 ev. and some at higher energies. The resonances are very sharp; *e.g.*, indium absorbs strongly only neutrons between 1.2 and 1.7 ev., and its capture cross section at 1.44 ev. is more than 100 times as large as that at 2.5 ev. To study these neutron resonance levels, special devices, known as velocity selectors, have been built which measure the time of flight of the neutron from its source to a detector. Studies of resonances give important information on the structure of nuclei; in fact, the resonance effects in the capture of slow neutrons gave rise to the modern theory of the compound nucleus, first developed by Niels Bohr, which forms the basis for the general understanding of reactions involving heavy nuclei.

Fission.—Neutrons can produce fission in heavy nuclei, especially in uranium, thorium and plutonium. Fission consists in the splitting of the heavy nucleus into two parts of almost equal weight. This is possible because the stored energy in the heavy nucleus is considerably greater than the sum of the stored energies in the two nuclei of medium weight which are produced by the fission. The difference in stored energy is released in the process of fission; it is approximately 200 Mev. per fission. In a plant in which 1 gr. of uranium undergoes fission per day, about 1,000 kw. of power are developed.

The use of fission for practical purposes is based on the fact that neutrons are emitted in the fission process and that more than one neutron is emitted per fission. This makes it possible to have a nuclear chain reaction in which the neutrons emitted in fission in turn produce fission. As was pointed out in *Neutron Production by Fission*, above, this process is the most suitable one for the practical production of neutrons in large quantities.

Detection of Neutrons.—One of the most important problems in neutron experiments is the detection of the neutrons. Since the neutron produces no direct ionization, it can be detected only through its interactions with other nuclei. Three types of effects may be used for the detection of neutrons, viz.:

(1) The recoil of a nucleus which has collided with a neutron; (2) the charged particles emitted in a nuclear reaction produced by a neutron and (3) the production of a radioactive nucleus by any nuclear reaction caused by the neutron (this reaction may be simple capture).

The first effect will occur only with fast neutrons and can, therefore, be used only to detect these neutrons; on the other hand, it has the advantage that it permits the determination of the energy of the neutron. The second and third effect can be used for the detection of slow as well as fast neutrons; different nuclear reactions are used in the two cases.

Fast Neutron Detectors.—Recoil Detectors.—In an elastic collision between a neutron of mass m and a nucleus of mass M the latter receives the kinetic energy

$$E' = \frac{4mM}{(M+m)^2} E \cos^2 \theta \qquad (1)$$

where E is the kinetic energy of the neutron before the collision and θ is the angle between the direction of motion of the incident neutron and the recoil nucleus. For ease of observation, a large kinetic energy of the recoil nucleus is usually desirable; therefore, protons are preferred because their mass M is practically equal to that of the neutron. If the recoil proton goes in the same direction as the incident neutron, it will receive the entire kinetic energy of the latter.

Protons are also favourable because the probability of their collision with a neutron is particularly large and can be calculated with great accuracy on theoretical ground. Furthermore, the recoil protons produced by neutrons of a given energy E are distributed uniformly in kinetic energy from 0 to E, which simplifies the determination of the energy of neutrons.

The most important types of proton recoil detectors are cloud

chambers filled with hydrogen or a gaseous hydrogen compound, photographic emulsions and ionization chambers with linear pulse amplifiers. The cloud chamber or emulsion is then exposed to neutrons coming from a definite direction and the direction as well as the length of the proton tracks is observed. From the length of the track the energy of the proton can be deduced. In an ionization chamber the energy is measured by the number of ions formed (by a single proton). The ionization chamber can be filled with hydrogen or provided with a layer of paraffin or some other solid material containing hydrogen. For the observation of large numbers of neutrons and determination of their energy, the ionization chamber is the most satisfactory instrument.

The efficiency of neutron counters is low, because of the small probability of collision between neutrons and nuclei. A proton recoil counter containing a thick layer of paraffin in an ionization chamber is the most efficient counter known for fast neutrons. If the neutron energy is E Mev., the counter will give about $2E$ pulses for every 10,000 neutrons incident upon it. Thin paraffin layers, of course, give even smaller efficiency but are more convenient for measuring the neutron energy. "Thick" and "thin" are to be understood in comparison with the range of the recoil protons.

Deuterons and alpha particles have also been used successfully for the observation of neutrons by the recoil method; in these cases, however, the energy distribution of the recoil nuclei is not uniform as it is in the case of protons. The recoil of still heavier nuclei, such as carbon, comes in mainly as a disturbing effect when compounds such as paraffin are used in a recoil detector.

Nuclear Reactions.—The reaction of neutrons with boron 10, giving alpha particles, can be used for the detection of fast neutrons. An unsatisfactory feature of this detector is that the reaction is produced with much higher probability by slow neutrons than by fast ones.

Fission is a very convenient means of detecting neutrons, because it gives rise to very large pulses of ionization which can easily be distinguished from any disturbing effect. It is usually desirable that the detector respond only to fast not to slow neutrons; this can be accomplished by using uranium 238 or thorium, rather than U^{235} or plutonium. The detection efficiency is about 100 times lower than for a proton recoil counter.

Radioactivity.—Many nuclear reactions produced by neutrons lead to radioactive nuclei. These can be observed after the end of the irradiation with neutrons, a fact which is often an advantage. For the detection of fast neutrons, reactions are preferable which can be produced only by fast neutrons. The reaction $n+Al^{27}=Mg^{27}+\mathrm{H}$ is a good example; Mg^{27} is a radioactive nucleus emitting beta-rays with a lifetime of about 10 min. The reaction can be produced only by neutrons of more than 2 Mev. kinetic energy and increases in probability with increasing neutron energy. Similar threshold detectors can be obtained by using Mg, Si, P, etc.

Of particular interest are threshold detectors sensitive to neutrons of extremely high energy. Such detectors are provided by nuclear reactions in which one neutron enters the nucleus and two neutrons are ejected. A very useful reaction of this type occurs with copper, leading to the formation of the radioactive nucleus Cu^{62} of 10 min. half-life; it occurs with neutrons of more than about 11 Mev. energy. For still higher neutron energy carbon is a good detector; a reaction of the same type leads to the formation of C^{11}, a radioactive nucleus of 20 min. half-life. The minimum neutron energy required in this case is about 20 Mev.

Detectors for Slow Neutrons.—The recoil type detector is not usable in this case, which leaves only two types:

Nuclear Reactions.—The most generally useful detector of slow neutrons is based on the reaction $n+B^{10}=Li^7+He^4$. This reaction has an extremely high probability for slow neutrons (cross section, 4,000 x 10^{-24} sq.cm.). The alpha particles have an energy of about 1.5 Mev. and are easily observed. The most commonly used detector consists of an ionization chamber filled with boron trifluoride gas; the ionization pulses are detected with the help of a linear amplifier. Moderate size chambers of this type (about 10 cm. long) at atmospheric pressure will detect about 10% of the neutrons of thermal velocity (2 km. per second) incident upon them. Increase in the pressure and size, and use of separated boron 10, will increase the efficiency. It is obvious that the detection of slow neutrons is much more efficient than that of fast ones.

Boron can also be used in the form of thin foils of boron metal or boron carbide, the alpha particles being detected in some neutral gas. Lithium 6 may be used instead of boron 10 but the detection efficiency in this case is about ten times smaller.

Fission is a very convenient means of detecting slow neutrons because of the large pulses of ionization. Uranium 235 or plutonium must be used because only these nuclei undergo fission when bombarded with slow neutrons.

Radioactivity.—There are many ways of observing slow neutrons by using the formation of radioactive nuclei. The most useful type of nuclear reaction for this purpose is the simple capture of neutrons (with emission of gamma-rays), which is generally much more probable for slow neutrons than for fast ones and thus provides a specific detector for slow neutrons. As has been mentioned before, neutron capture leads often, although not always, to the formation of a radioactive nucleus. Indium foils have been found especially useful as detectors of slow neutrons but also silver, gold, rhodium, bromine, iodine and other substances have been used successfully. The radioactivity is observed after the end of the irradiation by neutrons.

Detectors of this type can be selected so as to indicate slow neutrons of fairly definite velocities by making use of the resonance effects. In order to measure the number of very slow neutrons (less than 0.4 ev., thermal neutrons) one uses the fact that cadmium absorbs these neutrons very strongly while it is transparent for neutrons of higher energy. If one measures the radioactivity produced, for instance, in an indium foil with and without a shield of cadmium around the foil, the difference indicates the number of thermal neutrons incident upon the foil. On the other hand, the radioactivity observed with the foil covered by cadmium, is almost entirely because of neutrons whose kinetic energy corresponds to a resonance in the indium nucleus (see *Capture of Neutrons*, above). By using different detectors with different resonance energies, one can observe the properties of neutrons of various energies.

Neutron Diffusion.—For many experiments, it is desirable to reduce the velocities of the neutrons. This can be done by permitting the neutrons to collide with nuclei; in each collision some kinetic energy is transferred from the neutron to the nucleus. If this process is continued for a sufficient number of collisions, the velocity of the neutrons will be reduced until they come into equilibrium with the thermal motion of the atoms with which they collide.

In this manner so-called thermal neutrons are produced. The thermal neutrons have a velocity distribution similar to that of molecules in a gas; their mean velocity at room temperature is 2.2 km. per second. The thermal neutrons continue to make collisions with atomic nuclei; but since they are now in thermal equilibrium, these collisions no longer slow the neutrons down, there being equally many collisions in which the neutron gains and in which it loses energy. Ultimately, the neutron will be captured by a nucleus. This happens in most substances only after the neutrons have been slowed down to thermal energy because the capture probability is usually quite small compared to the probability of scattering. Only in some substances, like boron, capture will take place while the neutrons are still fast.

The production of slow neutrons, and of thermal neutrons in particular, is important from the scientific as well as from the practical point of view. The investigation of thermal neutrons has yielded most of the information about the radioactive nuclei formed by neutron capture. The investigation of neutrons of somewhat higher energy showed the existence of resonance levels in nuclei and thus laid the foundation for the modern theory of the compound nucleus (see *Capture of Neutrons*, above). For chain-reacting piles in which natural uranium is used, slow neu-

trons are important in order that the fission of uranium 235 predominates over the capture of neutrons in uranium 238. Whatever the purpose of the slowing down, it is important that not many neutrons are lost by capture during the process.

The most commonly used moderator for the slowing of neutrons is hydrogen in the form of paraffin or of water. Hydrogen has the advantage that the neutron loses a large fraction of its energy in each collision (see *Fast Neutron Detectors,* above) and that the effective cross section is large. Neutrons of an initial energy of 2 Mev. become thermal at an average distance of about 10 cm. from the source, in paraffin or water. However, a paraffin block of at least 50 cm. radius is required to prevent a sizable fraction of the neutrons from escaping. If the neutrons are emitted from the source with higher kinetic energy, larger amounts of paraffin are needed to slow them down and vice versa.

For atomic energy piles, hydrogen-containing substances are not suitable because protons capture neutrons with considerable probability. In this case, either heavy water or graphite are commonly used. The energy transfer in a collision is in this case much less than in the case of protons, and the effective cross sections are also smaller. Therefore, much larger amounts of material are required to slow the neutrons down to thermal energy; this is one of the reasons for the large size of atomic energy piles. On the other hand, there is practically no capture in either graphite or heavy water until the neutrons have been slowed to thermal energy, and even at thermal energy they will make hundreds of collisions before being captured.

The mathematical treatment of neutron diffusion is usually done in two stages; namely, first the slowing down to thermal energy and then the diffusion of the thermal neutrons. The second stage can be treated according to the ordinary methods of diffusion theory, using the diffusion equation

$$\tfrac{1}{3}\, lv\nabla^2 n - \frac{n}{\tau} + q = 0$$

where n is the density of neutrons (number per cubic centimetre), q the strength of the neutron source (number produced per cubic centimetre and second), l is the mean free path of the neutrons between two collisions, v their mean velocity and τ their mean lifetime, that is, the mean time which elapses before they are captured.

The mathematical treatment of the first stage, the slowing process, is quite difficult because the mean free path of the neutron changes with its velocity. A very useful although not exact concept in this theory is the age of the neutron, defined as one-sixth of the mean square distance travelled by the neutrons from the source to the point at which their energy drops below a certain arbitrary energy, E. The age η can be calculated as a function of E from experimental data and the density of neutrons of energy E at the distance r from the source in a homogeneous medium is given approximately by

$$n\,(\eta, r) = (4\pi\eta)^{-3/2} \exp(-r^2/4\eta).$$

Atomic Energy.—The basis for the practical release of the energy of atomic nuclei is the fission of uranium. As was mentioned already, fission can be caused by neutrons, and in each fission a certain number of neutrons, ν, is released. For uranium 235, for example, ν has the value 2.5. This is the basis of the nuclear chain reaction in which each of the neutrons produced in fission is again permitted to react with a uranium nucleus and can cause another fission.

Conditions are simplest in the rare isotope uranium 235, or in plutonium 239. These substances can be made to undergo fission by neutrons of any velocity; in fact, slow neutrons are most effective. Therefore, the slowing down of the neutrons by their unavoidable collisions with the uranium nuclei does not diminish their effectiveness. In a large mass of uranium 235, every neutron which has been released in a fission will in turn cause fission. Since the number of neutrons released in each fission is greater than one, the total number of neutrons will increase in this process. The increase is very rapid because very little time elapses between the production of a neutron and its causing fission in another nucleus. With large amounts of uranium 235 or plutonium, therefore, one obtains an explosive multiplication of the neutrons and an explosive release of fission energy. This is the principle of the atomic bomb.

If the amount of uranium 235 is reduced, a fraction of the neutrons produced in it will escape and, thus, not produce further fission. If the amount of uranium is made small enough, so that only one neutron out of every ν neutrons produced will stay in the uranium, whereas the remaining $\nu-1$ escape, the reaction will cease to lead to a multiplication of the number of neutrons but will merely be self-sustaining. This is the principle of the chain-reacting pile for the production of atomic energy without explosion. It is ordinarily desirable to keep the amount of the expensive material, uranium 235 or plutonium, to a minimum. This is accomplished both in the chain-reacting pile and in the bomb by surrounding the active material with a reflector, *i.e.,* any substance which can scatter neutrons back to the active material, and thus minimizes the number of escaping neutrons. Conditions are somewhat more complicated if ordinary uranium is used instead of the separated isotope 235. In this case the abundant isotope of uranium, 238, undergoes fission only when bombarded by fast neutrons, whereas slower neutrons will simply be captured, leading to the formation of uranium 239. In this capture the incident neutron disappears and no new neutron is emitted. Only the rare isotope uranium 235, which comprises about 0.7% of natural uranium, undergoes fission with slow neutrons, and thus can keep the chain reaction going. But in general the fission in 235 is much weaker than the capture in 238; only for neutrons of very low velocity, less than 1 ev., is the ratio reversed. Since it is not possible to avoid nuclear collisions and thus keep the neutrons at very high energies (at which they could produce fission in 238), it is necessary to slow them down completely, *i.e.,* to energies less than 1 ev., so that they can cause fission in 235 with high probability.

On the basis of these considerations atomic energy piles are designed to include a moderator, usually graphite or heavy water (see *Neutron Diffusion,* above), which serves to slow the neutrons down to thermal energies. The neutrons produced by fission have kinetic energies of several million electron volts; they are then permitted to diffuse in the moderator and come back as thermal neutrons to the uranium. Then some of them will cause fission in 235 and thus produce new neutrons to sustain the chain reaction. Other neutrons returning to the uranium will be captured in 238 and produce uranium 239. This is a radioactive nucleus which decays successively into neptunium and then into plutonium 239. The plutonium can be separated chemically from the uranium and can be used in its turn for atomic energy production. The production of plutonium in a chain-reacting pile is the first instance in which one chemical element has been transmuted into another in large quantities by man.

The chain-reacting pile is very useful for the production of neutrons in large quantity. By letting the emerging neutrons diffuse through large additional amounts of moderator, it is possible to obtain thermal neutrons which are almost entirely free of fast neutrons, for experimental purposes. Another use of chain-reacting piles is the production, by the capture of neutrons in various natural nuclei, of a great variety of radioactive nuclei which are useful as tracers in biology, chemistry and for industrial research.

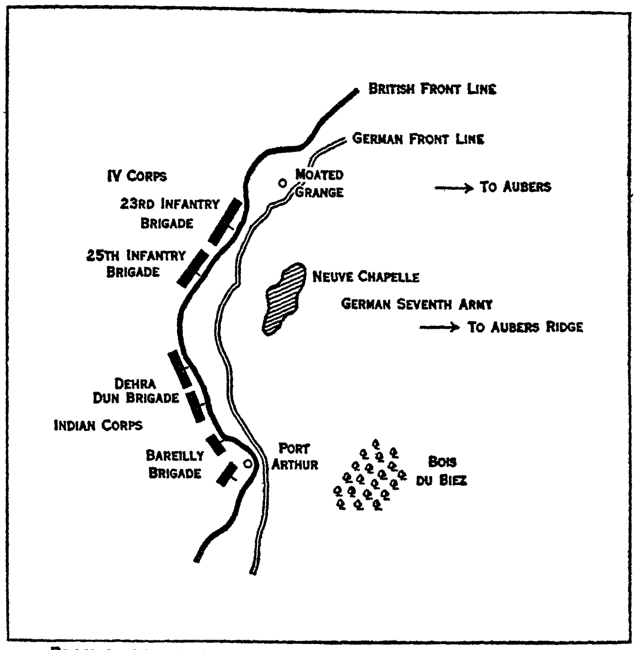
NEU-ULM, a town in Bavaria, Germany. Pop. 14,866 (1951). The town is situated on the Danube, opposite Ulm, and is a railway centre. It was incorporated as a town in 1857.

NEUVE CHAPELLE, BATTLE OF (March 10–13, 1915). Neuve Chapelle is a village in Pas de Calais west of Lille. Pop. (1946) 419. To understand the tactical idea upon which the battle of Neuve Chapelle was founded (the first of the siege warfare battles undertaken by the British army in France) it must be clearly kept in view that the British higher command had not grasped the fact that the war which now confronted them was an engineer-artillery war, and not a cavalry-infantry one. They considered that infantry could "open a door for an inroad of horsemen against the enemy's rear," and in spite of the failure of Neuve Chapelle, this quite impossible idea governed the tactics of Sir John French and Sir Douglas Haig up to the end of the war.

Plan of Attack.—On Feb. 12, General Haig recommended an offensive towards the Aubers ridge on a frontage of 2,000 yards between Port Arthur and the Moated Grange. Neuve Chapelle was to be the first objective, then a line east of the village, and finally the Aubers ridge, the occupation of which would threaten the enemy's communications between La Bassée and Lille. Sir John French, the commander-in-chief, approved of this plan, and fixed its date as soon after March 9 as weather would permit. The attack, or rather assault, was to be carried out by two corps, the Indian corps on the right and the IV corps on the left. It was to be made after an intense artillery bombardment of 35 minutes' duration. Having broken the enemy's front, it was proposed to extend the attack to five miles in width, and so make room for the cavalry corps to pass through and pursue. The bombardment was to be carried out by 530 guns and howitzers, and the ammunition available was approximately 216,380 rounds.

Operations of March 10.—At 4.30 A.M. the assaulting battalions were in position. The morning was cold and misty, and visibility was bad. Sunrise was at 6.30 A.M., and exactly one hour

later the general bombardment was opened. At 8.5 A.M. the attack was launched, and its first phase was carried out with considerable success. At 8.50 A.M. Neuve Chapelle was entered, but here the advance of the right was brought to a standstill by the British artillery barrage which had lifted, and was now falling between the village and the Bois de Biez. The first real trouble was experienced on the two flanks, on the right from the Bois de Biez, and on the



PLAN OF THE BATTLE OF NEUVE CHAPELLE, MARCH 10–13, 1915

left from Manquissart, from both of which a heavy fire was directed on the attackers rendering it impossible for them to extend their front rapidly. By 1 P.M. the whole of the first objective, except part of the Port Arthur salient, was in British hands. Then came a delay. Sir Douglas Haig proposed to advance on the Aubers ridge at 2 P.M., but this attack had to be postponed. This enabled the Germans to push forward reserves to their second line position east of the village, which was only partially dug. From this line an effective cross fire was brought to bear on the north of Neuve Chapelle.

Operations of March 11.—During the night the Germans strengthened their new front line. The main attack was carried out by the IV. corps, and was directed on Aubers, the Indian Corps supporting it on the right. It was launched at 7 A.M., but was at once crushed by heavy machine gun fire opened from the concave position now held by the enemy. A little after noon the attack had to be abandoned. It was then clear that until the infantry assault could be prepared by an effective bombardment, to continue the action would lead to unprofitable slaughter.

Operations of March 12.—At 5 A.M. on the 12th the Germans made a strong counter-attack which, however, failed in its object. This was followed by an order from Sir Douglas Haig to continue the attack. It was ordered and then postponed with the inevitable confusion resulting. The IV. Corps was instructed to "push through the barrage of fire regardless of loss." The Bois de Biez was to be taken "at all costs." The 7th and 8th Divisions were to push on "regardless of the enemy's fire," with the inevitable result that hundreds of men were at once shot down. By nightfall it became obvious that the battle could not be continued, and early on the 13th Sir John French, having lost 12,892 officers and men, wired to Lord Kitchener: "Cessation of the forward movement is necessitated . . . above all by want of ammunition."

Comments.—The true reason for the failure was lack of understanding. An attempt was made to attack a fortress as if it were a deployed army in the field. The conception of surprise was admirable, but it was useless to expect to capture the Aubers ridge from a frontage of 2,000 yards. To do so the frontage should have been at least 12,000 yards, because the ridge was some 6,000 yards distant, and because in siege-warfare the normal depth of penetration is half the length of the initial base. Nevertheless, in this battle, the first of the British grand attacks, and the first in which the "barrage" was used, more common sense was shown in restricting the artillery bombardment to the shortest possible time than in any subsequent battle up to that of Cambrai in November 1917. The German defences were but half a mile deep, and it was possible to fracture them by artillery fire if the bombardment were rapid, for rapidity carried with it surprise.

NEUVILLE, ALPHONSE MARIE DE (1836–1885), French painter, was born at Saint-Omer, France, on May 31, 1836. From school he went to college, where he took his degree of *bachelier ès lettres*. He first took up painting in 1856, after passing through the Naval College at Lorient. For a time he worked in Picot's studio, but was painting independently when he produced his first picture, "The Fifth Battalion of Chasseurs at the Gervais Battery (Malakoff)." In 1861 he exhibited "The Light Horse Guards in the Trenches of the Mamelon Vert," at the Salon. His pictures of military life showed peculiar insight, but his full power was not reached till after the war of 1870, episodes in which he depicted in a famous series, including the "Bivouac before Le Bourget" (1872), "The Last Cartridges" (1873), the "Surprise at Daybreak" (1878), and a considerable number of drawings. He also exhibited in London some episodes of the Zulu War. In 1881 he was made an officer of the Legion of Honour for "The Cemetery of Saint-Privat" and "The Despatch-bearer." He also collaborated with Detaille in "The Panorama of Rézonville." De Neuville died on May 18, 1885.

See Montrosier, *Les Peintres militaires* (1881), and "De Neuville" in *Gazette des beaux arts* (1885).

NEUWIED, a town in the Prussian Rhine province, Germany, on the Rhine, 8 mi. below Coblenz, on the railway from Frankfort-on-Main to Cologne. Pop. (1939) 21,593. Neuwied was founded by Count Frederick of Wied in 1662, on the site of the village of Langendorf. Among those who sought refuge here was a colony of Moravian Brethren; occupying a separate quarter of the town, they carried on manufactures of porcelain stoves. Near Neuwied one of the largest Roman *castra* on the Rhine has been excavated. The principal building is the château, which contains a collection of Roman antiquities.

NEVA, a river of Russia, which carries off into the Gulf of Finland the waters of Lakes Ladoga, Onega, Ilmen and many smaller basins. It issues from the south-west corner of Lake Ladoga in two channels, which are obstructed by sandstone reefs, so that the better of the two has a depth of only 7 to 16 feet. A little farther down it becomes completely navigable, and attains a breadth of 4,200 ft.; but between the village of Ostrovki and that of Ust-Tosna it passes over a limestone bed, which produces a series of rapids, and reduces the width of the river from 1,050 to 840 and that of the navigable passage from 350 to 175 feet. Nine or ten miles before reaching its outfall the river enters Leningrad, and 5 or 6 m. lower down breaks up into the Great Neva (850 to 1,700 ft. wide), the Little Neva (945 to 1,365), and the Great Nevka (280 to 1,205), this last, 2 m. farther on, sending off the Little Nevka (370 to 1,130 ft.). Its total length is only 40 miles. In front of the delta are sandbanks and rocks which prevent the passage of vessels except by a canal, 18 m. long, 124 to 226 ft. wide, and admitting vessels with a draught of 18½ ft., from Kronstadt to Leningrad. When Lake Ladoga sends down its vast accumulations of block-ice, inundations of a dangerous kind occur, as in 1777, 1824, 1879, 1903, and especially in 1924.

According to observations extending from 1706 to 1899, the mean day of the freezing of the Neva is Nov. 25, the earliest Oct. 28, the latest Jan. 9, and the next latest Dec. 26. The mean day of opening is April 21, the earliest March 18, the latest May 12.

NEVADA, popularly known as the "Sagebrush state," is one of the far western states of the U.S. It lies between approximately 35° and 42° N. and 114° 2′ and 120° W., and is

bounded north by Oregon and Idaho, east by Utah and Arizona, south and west by California. The Colorado river separating it in part from Arizona is the only natural boundary the state possesses, the others being arbitrary lines of geodetic measurement. Nevada ranks sixth among the states in size, having an area of 110,540 sq.mi., 751 sq.mi. of which are water surface. Its exreme length north and south is 483 mi., and its extreme width east and west is 320 mi. Its name, a Spanish word meaning "snow-clad," was originally applied to the snow-capped Sierra Nevada range on the Pacific slope.

Physical Features.—With the exception of its northeast and southeast corners, the state lies wholly within the Great Basin, the floor of which is really a vast tableland between 4,000 and 5,000 ft. above the sea.

This plateau, however, is not a plain, but contains many buttes, mesas and isolated mountain ranges, the latter running generally in a north and south direction and rising 1,000 to 7,000 ft. above the level of the plain. These ranges are from 5 to 20 mi. wide at their bases, and the valleys between are about the same width as the bases.

The total area of the valleys is about equal to that of mountainous land. In the northeast an unnamed range of highlands, broken and ill-defined, with a general east and west trend, forms the water parting between tributaries of the Humboldt river in the Great Basin region and those rivers that flow to the Snake river in Idaho and Oregon and thence via the Columbia river to the Pacific ocean. This drainage area of the Snake amounts to about 5,000 sq.mi. the Owyhee, Little Owyhee, Salmon and Bruneau rivers being the principal streams. In the southeast corner is the third drainage system. Here the Virgin river from Utah, after crossing the northwest corner of Arizona, enters the state and flows southwest for 60 mi. until it joins the Colorado river.

The latter stream flows for 150 mi. along the southeast boundary toward the Gulf of California. The Colorado leaves Nevada at an altitude of but 470 ft. above sea level, the lowest point in the state. The mean elevation of the state is 5,500 ft. and, with the exception of the dip to the Colorado in the southeast, the entire state lies above the 2,000 ft. line.

The Sierra Nevada range, which forms the western rim of the basin, sends into the state a single lofty spur, the Washoe mountains. At the foot of this range there is, relatively speaking, a depression, with an altitude of about 3,850 ft. above the sea, which receives the drainage of the eastern slopes of the Sierra, and what little drainage there is in the northern half of Nevada. From this depression eastward the general level of the plateau rises to an elevation of 6,000 ft. near the eastern borders of the state.

The mountain ranges also increase in height and importance as far as the East Humboldt range, a lofty mass about 60 mi. west of the Utah boundary. This range is the water parting for nearly all the westward-flowing streams of the state, and is by far the steepest and most rugged within Nevada, a number of its peaks attaining a height of 11,000 or 12,000 ft. On its eastern slope the waters soon disappear within the bed of narrow canyons, but break out again at the foot in ice-cold springs that form the source of the Ruby and Franklin lakes; on its western side the descent is more gentle, and the waters form the south fork of the Humboldt river.

The Humboldt is the most important of the basin streams. Rising in the northeast it flows in a tortuous channel in a general southwest direction for 290 mi. and drains 7,000 or 8,000 sq.mi. It empties into Humboldt lake, the overflow from which goes into the so-called Carson sink. At no part of its course is it a large river and near its mouth its waters are subalkaline. The Truckee, Carson and Walker rivers flow with more vigour, receiving their waters from the eastern slopes of the Sierra Nevada range and discharging them into alkaline lakes. Of these lakes Pyramid is the largest, being about 30 mi. long and 4 to 13 mi. wide. Walker lake is as long but only six or seven miles in width. These larger lakes always contain water, varying only in area and depth, but the smaller lakes usually evaporate in the course of the summer. The latter are formed by waters that fall on barren mountainsides and rush down in torrents, forming in the valleys shallow bodies of water yellow with mud held in suspension.

Excepting the "alkali flats" no portion of the desert is devoid of vegetation, even in the driest seasons. In the Washoe mountains there is a heavy growth of conifers extending down into the valleys; but in many places these mountains have been almost deforested to provide timber for the mines. In other places these areas have been incorporated into national forests, in the endeavour to protect and foster the growth of timber and vegetation so as to regulate the drainage of the state. On all but the lowest ranges of the basin the piñon and juniper are found, but these rarely grow to a height of more than 15 ft.; and on the principal ranges above 6,800 ft. is the stunted mountain mahogany. But except for these infrequent wooded areas, the mountains are even more bare than the valleys, because their shrubs are dwarfed from exposure. The valleys are covered with typical desert shrubs, greasewood, creosote bushes and sagebrush, and with bunch grass, which is valuable for grazing.

The skies of Nevada are clear nearly every day in the year. The mean annual precipitation varies from 3 in. in the southwest (Esmeralda county) to 12 in. in the east (White Pine county), and varies also according to altitude. Snow rarely lies on the ground in the valleys.

History.—The first recorded person of European descent to enter the limits of Nevada was Francisco Garcés of the Order of St. Francis, who set out from Sonora in 1775 and passed through what is now the extreme southern corner of the state on his way to California.

Half a century later trappers of the Hudson's Bay company led by Peter Skene Ogden entered Nevada from the north and discovered the Humboldt river. In 1827 Jedediah S. Smith, an American trader from St. Louis, crossed the state from west to east on his return from California after the first recorded journey from the Mississippi to the Pacific by the central route. In 1833 Capt. Benjamin Bonneville's men were on the Humboldt, and during 1843–45 John C. Frémont made a series of explorations in the region. The first recorded emigrant train to California crossed the state in 1841. By the treaty of Guadalupe Hidalgo, negotiated in 1848 at the close of the war with Mexico, Nevada became U.S. territory. It was then a part of California known as the Washoe country, and so remained until 1850, when most of the present state was included in the newly organized territory of Utah. One of the first settlements was made in 1849 by Mormons at Genoa in the valley of the Carson river. Here in 1851 the earliest recorded public meeting in the state was held to frame a government for the settlers since the seat of the territorial government of Utah was considered too remote to afford protection to life and property. But the Utah authorities intervened and in 1854 the Utah legislature created the county of Carson to include all settlements in western Utah.

In 1858 Carson City was laid out, and in the following year the people of Carson county chose delegates to a constitutional convention which met at Genoa and drafted a constitution. It was adopted by vote of the people, but this attempt to create a new state government proved abortive, and it was not until the mineral wealth of the Washoe country became generally known that congress took action.

In 1861 the territory of Utah was divided at 39° W. of Washington, D.C., and the western portion was called Nevada. The Comstock lode, one of the richest deposits of precious metal known in the world, was discovered in 1859, and Nevada ceased to be merely a highway for gold seekers on the way to California and became a stopping place. Virginia City became the most famous of all the mining camps of the far west.

An attempt to win statehood in 1863 was defeated, but in 1864 when it became evident that two more Republican votes were needed in the U.S. senate for reconstruction purposes, party leaders at Washington urged the people of Nevada to adopt a constitution and enter the union as a patriotic duty. The third constitutional convention in its history met at Carson City and drew up a constitution which was duly ratified, and in October of that year, Pres. Abraham Lincoln proclaimed the new state. The eastern boundary was pushed eastward to its present location on the

37th meridian west of Washington, D.C., in 1866, and the southern boundary was also fixed in that year. Being "battle-born," Nevada was loyal to the union throughout the Civil War, and furnished a company of troops in 1861 which was joined to a California regiment. In 1863 the territory raised six companies of infantry and six of cavalry (about 1,000 men), which saw no actual service against the Confederates but were useful in subduing hostile Indians.

The history of the state since its organization has been largely a history of its mines. From 1864 to 1868 there was a general reaction in the industry caused by unwarranted speculation and inflated values. After 1868 there came a period of consolidation, of more systematic workings, and of deeper development. In 1873 came the discovery of the "big bonanza" by John Mackay, James Fair, William O'Brien and Flood, who became the four "bonanza kings" of Nevada. In 1873, $21,000,000 was taken from the Comstock and production increased until a maximum of $36,000,000 was reached in 1878. The Sutro tunnel intersected the lode in the latter year, and drained the mines. But the richer workings soon proved below the tunnel level and the shafts were sent deeper. In 1882 an immense flow of hot water was struck which flooded the principal mines up to the Sutro tunnel level. The miners were forced to return to the upper levels and work the lower grade ores. Production decreased and with the end in sight the market slumped. Also, the national government had abandoned its artificial maintenance of the price of silver. The period of depression lasted until about 1900 when the discovery of a new mineral belt in southern Nevada brought renewed prosperity. Tonopah, 60 mi. from the railroad, became the new Mecca, and fast upon the heels of its discovery came that at Goldfield. A railway was completed to the new camps in 1904 and Tonopah proved to be one of the largest and steadiest producing districts of the state. Copper ores of vast extent were discovered at Ely at about the same time and the Nevada Northern railway was completed to this camp in 1907.

The depression immediately before 1900 served a good purpose in turning attention to the agricultural and livestock possibilities of the state. The river valleys under irrigation proved most fertile and these were soon settled by large-scale ranchers. On the river bottoms the ranchers raised their hay and controlled a still larger acreage of the upland grazing ground. Private irrigation systems were supplemented by federal undertakings, the most notable being the Truckee-Carson project. Many beautiful valley towns now have their prosperity founded on the permanent basis of agriculture rather than the uncertain one of mining.

Until the silver agitation of the '90s Nevada was safely Republican. The state's politics in the early period were replete with corruption, and many of its rich mine owners were accused of buying their seats in the United States senate. For four state elections the Silver party swept the state. After the issue subsided the old parties came into control. In the national elections of 1932-48 the state returned the Democratic ticket. After the legalization of gambling in 1931 and the reduction to six weeks of the residence requirement for divorce Nevada became a marriage, divorce and resort centre; during the period 1949–50 there were 9,342 divorces granted and 45,864 marriages solemnized in the state.

In 1936 Hoover dam was built across the Colorado river, situated 31 mi. from Las Vegas. This great dam attracts hundreds of thousands of tourists yearly, bringing $2,000,000 to Nevada.

Government.—Nevada is governed under its original constitution, adopted in 1864, and since amended in important respects. Proposed amendments must be passed by a majority in both houses of two consecutive legislatures before they can be submitted to the people.

The legislature, composed of a senate and assembly, meets regularly in January of every odd-numbered year, its sessions being limited to 60 days. The constitution requires that the number of senators shall be not less than one-third nor more than one-half the number of members in the assembly, and that the membership of both houses shall not exceed 75. In 1951 there were 17 senators and 43 assemblymen. Senators are elected for four years—one-half the membership retiring every two years; assemblymen are elected biennially. The initiative and referendum were adopted by amendment in 1904.

The principal administrative officers are the governor, lieutenant governor, secretary of state, attorney general, controller, treasurer, inspector of mines, surveyor general and superintendent of public instruction, all elected for four-year terms. The governor does not possess the usual sole pardoning power but serves together with the justices of the supreme court, the clerk of the supreme court and the attorney general on the board of pardons. There are many administrative boards and commissions, the most important of them being the board of welfare, board of examiners, Nevada tax commission, industrial commission, department of highways, Colorado river commission, fish and game commission, board of education, board of health and public service commission.

The judicial department consists of a supreme court with a chief justice and two associate justices, chosen for six years, and eight district courts, the 2nd with three judges and seven with one judge, elected for four years. Each township has a justice of the peace chosen biennially by its voters. The statutes provide that only three-fourths of the jurors may be required to agree to a verdict in civil cases. Nevada was the first state in the world to execute condemned men painlessly by means of odourless lethal gas. In 1931 a residence of six weeks in the state became necessary for divorce.

The county is the principal unit of local government. There are 17 counties in the state, some as large as several eastern states put together.

Population.—The population of Nevada in 1860 was 6,857; in 1880 it was 62,266; in 1910, 81,875; in 1940, 110,247; and in 1950, 160,083. This last figure represented an increase of 45.2% over the population in 1940. The population per square mile in 1950 was 1.5, as compared with 1.0 in 1940 and with 50.7 for the U.S. in 1950.

Of the 1950 population, 84,079, or 52.5%, lived in incorporated places of 2,500 or more, as compared with 39.3% in 1940, when these places constituted the urban area.

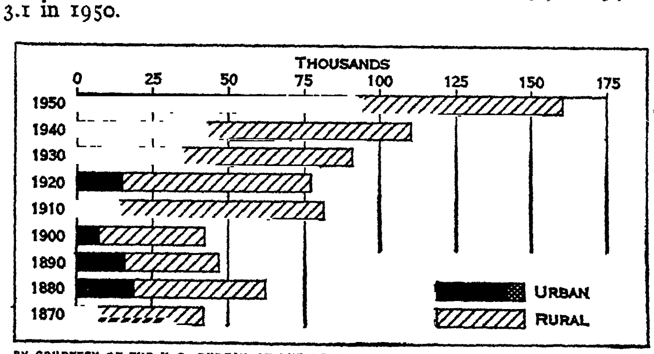
The entire urban population, under a new definition set up for 1950, which included also two unincorporated places of 2,500 or more, amounted to 91,625, or 57.2% of the state total.

TABLE I.—*Population of Nevada and Its Principal Cities*

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40
The state	160,083	110,247	91,058	45.2	21.1
Urban*	91,625	43,291	34,464	111.6	25.6
Rural*	68,458	66,956	56,594	2.2	18.3
Per cent urban	57.2	39.3	37.8	..	..
Principal cities					
Reno	32,497	21,317	18,529	52.4	15.0
Las Vegas	24,624	8,422	5,165	192.4	63.1
Carson City	3,082	2,478	1,596	24.4	55.3

*Final figures based on *new* definition. *See* comment in text.

The number of occupied dwelling units (or households) in 1950 was approximately 52,000, as compared with 33,000 in 1940. The average population per household had declined from 3.3 in 1940 to 3.1 in 1950.



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEVADA: 1870 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

The population of the state was distributed by colour and nativity in 1950 as follows: 87.1% native white; 6.6% foreign-born white; and 6.3% nonwhite, mainly Indians. There were 113.4 males per 100 females in the native white population and 159.9 in the foreign-born. Seven per cent of the population were 65 years old or over; 58.8% of the population 14 years old and over were in the labour force. Of the total number of employed males, 13.1% were engaged in agriculture, 6.8% in mining, 11.2% in construction, 6.1% in manufacturing, 11.0% in transportation and 17.5% in wholesale and retail trade.

Finance.—The state legislature authorizes all expenditures, and in turn fixes a tax levy which shall produce revenue enough to meet these expenditures. The supervision of the assessment and collection of taxes is in the hands of the Nevada tax commission consisting of the governor, acting as chairman, and six commissioners appointed by him. The director of the budget prepares the annual state budget, and exercises control of departmental spending. The director and the state board of examiners scrutinize every expenditure item. The post audit function is performed by the legislative auditor responsible to the legislature and the legislative counsel bureau

The credits of the state for the fiscal year ending June 30, 1950, amounted to $26,581,680, the debits to $25,797,769. There was a treasury balance of $5,587,310. As in most states, a large share of the receipts is derived from property taxation.

The state had bonds outstanding July 1, 1950, in the amount of $785,000, for construction of office and institutional buildings. This amount was more than offset by bonds and securities held by the state, income from which was $155,570.

On July 1, 1950, there were 26 individual banking institutions in the state, of which 19 were branches, 5 were national banks and 3 were state banks. The resources of Nevada banks totalled $179,204,871, and deposits were listed as $167,425,005. The 1950 assessment for tax purposes amounted to $312,536,414.

Education.—The state board of education is composed of the governor, the state superintendent of public instruction and five members elected one from each of the educational supervision districts of the state. There were in 1950 29,490 pupils enrolled in the public schools in the state, as against 20,746 in 1941. Of the total 1950 enrolment, 6,416 were in the public high schools. There were 15 kindergartens, 166 elementary schools and 38 high schools, staffed by 35 kindergarten teachers, 846 elementary teachers and 365 high school teachers.

The only institution of college rank is the University of Nevada, located on an eminence overlooking the city of Reno. Its enrolment during the regular session, 1950–51, was 1,466, composed of 996 men and 470 women. The Mackay School of Mines, founded and endowed by the family of John W. Mackay, one of the "bonanza kings" of the Comstock lode, is an outstanding department. A meteorological observatory is maintained at the top of Mount Rose.

Libraries.—The state library at Carson City, established in 1861, contained 184,682 volumes in 1950, including 55,229 volumes on law. Because of the completeness of its early-day statutes of every state in the union, it is one of the leading law libraries in the United States. The university library, housed in the Alice MacManus Clark building, contained 90,700 bound volumes in 1950. Other libraries at the university are the agricultural library, the Mackay research library and the mining library. A total of 18 libraries served every section of the state at mid-20th century.

Charities and Corrections.—A state orphans' home is located at Carson City, a state hospital for mental diseases at Reno, and a home for male juvenile delinquents at Elko. The state penitentiary is at Carson City.

Agriculture and Livestock.—Nevada is the most arid state of the United States because the high Sierra Nevada range interrupts the moisture-laden clouds from the Pacific. East of these mountains, the valleys, however rich their soils, are covered with sagebrush and appear like monotonous desert wastes, except where some stream annually overflows its banks to create natural meadows, or where the land has been cleared of sagebrush and artificially watered. Agriculture is dependent almost entirely upon irrigation; how much so is shown by the fact that while there were approximately 546,000 ac. of improved farmland in the state in 1944, 674,204 were under irrigation. During the period 1939–44 a decrease in the acreage of irrigated lands was caused by a number of dry years. The hay crop in 1948 was still of first importance, amounting to 647,000 tons valued at $12,293,000 while the estimated value of all Nevada's farm products was but $36,000,000. In southern Nevada hay and forage, wheat, tomato plants and barley are the principal crops, with berries, apples and other orchard fruits growing on both irrigated and unirrigated lands.

The total number of all cattle increased from 342,213 in 1937 to 546,000 in 1949; most of these were raised for beef purposes. The number of milch cows was 22,000 in 1949. Sheep numbered 473,000, horses 36,000 and swine 28,000. The 1948 wool clip yielded 3,689,000 lb.

The farm population in Nevada, similar to the trend in most of the mountain states, fell from 16,441 in 1930 to 15,852 in 1940, a decrease of 3.6%. Between 1940 and 1945 the number of farms decreased from 3,696 to 3,429, but the harvested acreage of Nevada's 46 crops totalled 487,000 in 1944.

TABLE II.—*Harvested Area and Production of Principal Crops in Nevada*

1948	Acreage harvested in 1,000 ac.	Production in 1,000 bu.
Corn	2	54
Wheat	22	652
Oats	9	369
Barley	22	814
All hay	438	647 tons
Potatoes	2	300

Mining.—From 1907 metal production steadily increased until it reached its peak in 1917, in which year gold, silver, copper, lead and zinc were produced to the value of $54,424,580. The years 1918–21 were years of swift decline, the production in 1919 being less than half that of 1918, and that of 1921 only 50% that of 1919. An upward turn came in 1923 when the gross production of all minerals rose to $28,598,627. From then through 1929 production of metals continued to rise steadily; in the latter year output was valued at $36,776,000. The economic depression which set in at the close of 1929 caused a tremendous decline in mineral production; in 1932 it was only $6,568,000. By 1940 it had risen to $42,571,000; and by 1947 to $42,639,000.

Gold and silver were first to recover from the depression because of the revaluation of the gold dollar and the passage of the Silver Purchase act in 1934. As a result of the government action the production of gold, amounting to 98,590 fine ounces in 1933, rose to 380,000 fine ounces in 1940. Its value rose from $2,519,968 in 1933 to $13,300,000 in 1940. Silver production increased from 1,148,621 fine ounces in 1933 to 5,102,000 fine ounces in 1940; with corresponding values of $402,017 and $3,628,032. During World War II production declined to approximately one-fourth of the 1940 production, but later increased to 111,532 fine ounces of gold and 1,790,020 fine ounces of silver in 1948, with corresponding values of $3,903,620 and $1,620,058. The production of lead increased from 880,896 lb. in 1932 to 14,998,000 lb. in 1940 and 19,554,000 lb. in 1948. The value in the latter year was $3,500,166. Zinc production, which amounted to 23,666,000 lb. in 1940, increased to 40,576,000 lb. in 1948; the value increased from $1,490,958 in 1940 to $5,396,608 in 1948. Almost all of the lead-zinc ore mined in Nevada contains substantial quantities of silver and gold, and mines in the Pioche district were the largest producers.

Copper was especially hard hit by the economic depression which began in 1929 because of the sudden, sharp falling off of demand together with the large inventories of ore the companies accumulated in the next two years. Production fell from 84,475,000 lb. in 1930 to 28,490,000 lb. in 1933. It rose to 151,820,000 lb. in 1940, but decreased to 90,484,000 lb. in 1948, production being stimulated by defense needs during World War II but declining after the war. However, the value of copper production increased from $1,823,335 in 1933 to $17,155,660 in 1940 and $19,635,028 in 1948, by far the largest share of the output in

Nevada coming from the Ely district in White Pine county.

After World War II Nevada continued to be an outstanding producer of mercury, tungsten, antimony and gypsum, although production of these minerals had declined from previous years, except gypsum which had a steady increase. Other minerals are barite, fluorspar, magnetite, sulphur and magnesium. Considerable magnesium is ordinarily produced at Gabbs valley and shipped out of the state. In 1948 the state acquired the huge magnesium plant at Henderson from the federal government, and chemicals, caustic soda, chlorine and various strategic fuels and metals were produced at the plant. Some turquoise was mined at Battle Mountain and Tonopah in 1948, but the production of gem stones in Nevada was on a reduced scale.

Manufactures.—The manufacturing interests of Nevada are unimportant. There were in 1947 only 126 establishments employing 2,667 workers, paying $8,409,000 in wages and manufacturing goods to the value of $27,777,000, an amount less than that of any other state. This represented a decrease in value of manufactures from the $33,717,000 produced in the peak year of 1929.

Transportation.—Nevada is crossed east and west by three main lines of railway, the Southern Pacific and the Western Pacific in the northern part and the Union Pacific system in the southern. Branch lines connect the more important mining towns with these lines. Railway mileage in the state reached a peak in 1915 when it amounted to 2,332 mi.; by 1947 it had decreased to 1,704 mi. In 1950 there were 3,560 mi. of road in the designated state highway system, of which 3,278 mi. were of dustless paved surface and 282 mi. improved state highways. During 1950, 211 mi. were constructed or reconstructed, with 165 mi. under construction at the end of the fiscal year; total disbursements for highways were $8,305,523. Motor vehicle registrations in 1949 totalled 71,990, of which 71,588 were privately owned and 402 were publicly owned.

NEVADA, a city of southwestern Missouri, U.S., 90 mi. S. of Kansas City, at an altitude of 860 ft.; the county seat of Vernon county. It is on federal highways 54 and 71 and is served by the Missouri-Kansas-Texas and the Missouri Pacific railways. Pop. (1950) 7,986. It is the seat of a state hospital for the insane and of Cottey Junior college for girls (1884). The national guard of Missouri has a camping ground nearby. There are chalybeate and sulphur springs in one of the city's parks. Coal is mined in the vicinity, and the city has flour and planing mills, galvanized iron works and other manufacturing industries. Nevada was platted in 1855, incorporated as a town in 1869 and chartered as a city in 1880. During the Civil War it was burned to the ground (1863).

NEVADA CITY, a city of eastern California, U.S.A., on Deer creek, at an altitude of 2,525 ft., 63 mi. N.N.E. of Sacramento; the county seat of Nevada county.

The population was 2,487 in 1950, 2,445 in 1940 and 1,701 in 1930 by the federal census. It is a summer resort and a supply centre for the neighbouring mining camps. The county is a large producer of gold, first discovered there in the summer of 1849 by James W. Marshall, who in the preceding year had picked up the first nugget in California, near Coloma. The gold output was at its peak in 1850–51.

Nevada City was incorporated in 1851 under a special act of the legislature (repealed in 1852).

Nevada City was reincorporated in 1856 and again in 1878.

NÉVÉ or **FIRN,** masses of compacted snow formed from the accumulated snow in the catchment area of a glacier, by processes of alternate thawing and freezing. The névé is the feeding ground for the valley-glaciers. (*See* Glacier.)

NEVERS, a town of France, capital of the department of Nièvre, 159 mi. S.S.E. of Paris by the P.L.M. railway to Nîmes. Pop. (1934) 34,036. *Noviodunum,* the early name of Nevers, was later altered to *Nebirnum.* Many medals and Roman antiquities found there show its importance when Caesar chose it as a military depôt. In 52 B.C. the town was the first place siezed by the revolting Aedui. It became the seat of a bishopric at the end of the 5th century.

Having formed part of the duchy of Burgundy, the county of Nevers (Nivernais) was given by Duke Henry I in 987 to his stepson, Otto Williams, afterwards count of Mâcon, from whom it passed to his son-in-law, Landri. The first house of the hereditary counts of Nevers originated in Landri, and was brought to an end in 1192 by the death of Agnes, countess of Nevers, wife of Pierre de Courtenay (d. 1217).

The county subsequently passed into the houses of Donzy, Châtillon and Bourbon. Nevers is on the Loire where it joins the Nièvre. Narrow winding streets lead from the quay through the town, with many old houses (14th to the 17th centuries). The cathedral of St. Cyr is a combination of two churches, one Romanesque (11th century), the other Gothic (14th century). There is a fine square (16th century) tower on the south side. The church of St. Étienne is 11th century Romanesque. The ducal palace at Nevers (now occupied by the courts of justice and an important ceramic museum) was built in the 15th and 16th centuries and is one of the chief feudal buildings in central France.

An octagonal middle tower contains the great staircase, and its windows are adorned by sculptures relating to the history of the house of Clèves. The Porte du Croux, a square tower, with corner turrets (14th century) is among the remnants of the old fortifications.

Nevers is the seat of a bishopric under the archbishop of Sens, of tribunals of first instance and of commerce and of a court of assizes and has a chamber of commerce.

NEVILLE or Nevill, the family name of a famous English noble house, descended from Dolfin, son of Uchtred, who had a grant from the prior of Durham in 1131 of "Staindropshire," Co. Durham, a territory which remained in the hands of his descendants for over four centuries, and in which stood Raby castle, their chief seat.

His grandson, Robert, son of Meldred, married the heiress of Geoffrey de Neville (d. 1192–93), who inherited from her mother the Bulmer lordship of Brancepeth near Durham. Henceforth Brancepeth castle became the other seat of the house, of which the bull's head crest commemorates the Bulmers; but it adopted the Norman surname of Neville (*Neuville*). Robert's grandson, another Robert (d. 1282), held high position in Northumbria, and sided with Henry III in the Barons' War, as did his younger brother, Geoffrey (d. 1285), ancestor of the Nevills of Hornby. This Robert's son, Robert (d. 1271), extended the possessions of the family into Yorkshire by his marriage with the heiress of Middleham. The summons of their son, Ranulf (d. 1331), to parliament as a baron (1294) did but recognize the position of the Nevills as mighty in the north country. Ralph (d. 1367), the second baron—whose elder brother "the Peacock of the North" was slain by the Douglas in 1318—was employed by Edward III as a commander against the Scots and had a leading part in the victory of Nevill's Cross (1346), where David Bruce was captured, and by which Durham was saved. His active career as head of his house (1331–67) made the name of Nevill a power on the Scottish march.

Of his younger sons, Alexander became archbishop of York (1374–88) and was a supporter of Richard II, attending him closely and encouraging his absolutist policy; he was one of those "appealed of treason" by the opposition in 1388 and was outlawed. He died abroad in 1392.

His younger brother, William, a naval commander, was a leading Lollard and a friend of Wycliffe, and in 1388–89 acted with the lords appellant.

John, the 3rd baron (d. 1388), a warden of the Scottish marches

and lieutenant of Aquitaine, a follower of John of Gaunt and a famous soldier in the French wars of Edward III., continued the policy of strengthening the family's position by marriage; his sisters and daughters became the wives of great northern lords; his first wife was a Percy, and his second Lord Latimer's heiress; and his younger son, Thomas, became Lord Furnival in right of his wife, while his son by his second wife became Lord Latimer. His eldest son Ralph (1364–1425), 1st earl of Westmorland (*see* WESTMORLAND, EARLS OF), married as his second wife a daughter of John of Gaunt and secured heiresses for five of his sons, four of the younger ones becoming peers, while a fifth, Robert, was made bishop of Durham (1438–1457). Among his daughters were the duchesses of Norfolk, Buckingham and York (mother of Edward IV. and Richard III.) and an abbess of Barking. The Nevills were thus closely connected with the houses of Lancaster and York, and had themselves become the most important family in the realm. Of the earl's sons by his second marriage, Richard, earl of Salisbury (and three of his sons) and William, earl of Kent, are the subjects of separate notices.

The greatness of the Nevills centred in the "kingmaker" (Richard's son) and the heads of his house, after the 1st earl, were of small account in history, till Charles, the 6th earl, at the instigation of his wife, Surrey's daughter, joined Northumberland in the fatal northern rising of 1569 to the ruin of his house. His estates, with the noble castles of Brancepeth and Raby, were forfeited; Middleham, with the Yorkshire lands, had been settled by the 1st earl on the heirs of his second marriage.

Although the senior line became extinct on the earl's death abroad (1601), there were male descendants of the 1st earl remaining, sprung from George and Edward, sons of his second marriage. George, who was Lord Latimer, was father of Sir Henry, slain at Edgcote fight, and grandfather of Richard, 2nd lord (1469–1530), a soldier who distinguished himself in the north, especially at Flodden Field. His grandson (d. 1577) was the last lord, but there were male descendants of his younger sons, one of whom, Edmund, claimed the barony, and after 1601 the earldom of Westmorland, but vainly, owing to its attainder.

The heirs male of Edward, Lord "Bergavenny" (now "Abergavenny" co. Monmouth), who died in 1476, have retained their place in the peerage under that style to the present day. In 1784 the then Lord Abergavenny received an earldom, and the next lord erected at Eridge, Sussex, the present seat of the family, on which the marquisate of Abergavenny and earldom of Lewes were conferred in 1876. Its Sussex estates are derived through the Beauchamps, from the Fitz Alans, heirs of the Warennes.

See Rowland's *Historical and Genealogical Account of the Family of Nevill* (1830); Drummond's *Noble British Families* (1846); Swallow's *De Nova Villa* (1885); and Barron's sketch in *The Ancestor*, No. 6 (1903). Round's *Feudal England;* and for the Nevill castles Mackenzie's *Castles of England.* For the Kingmaker, *see* Oman's monograph (1891).

NEVILLE'S CROSS, BATTLE OF. This battle of Oct. 17, 1346, took place after Crécy (*q.v.*) and while Edward III. was still abroad, besieging Calais. It foiled the opportunist Scottish invasion, and assured Edward's freedom to continue his French projects. But its main interest in military history is that it affords an example of the offensive power of the new tactical combination of archers and spearmen, in contrast to Dupplin, Halidon Hill, Crécy, Poitiers and Agincourt, which were all won by awaiting the enemy's onslaught. After crossing the border, King David Bruce was surprised by the quickness with which the English, under William de la Zouch, archbishop of York, concentrated to meet him. Driven to accept battle near Durham, the Scottish king took up his position to resist attack, his pikemen formed in three great "schiltrons." The English advanced, with their left leading, and the archers on this wing overlapped and swarmed round the Scottish right flank "schiltron." When this broke under the arrow-storm, they closed on the centre "schiltron" —already attacked in front. Its collapse, in turn, under the converging pressure, led to the capture of the king and the hurried retreat of the remaining left division of pikemen. Thus the archers proved their power against an immobile foe to pave the way for a successful assault by knights and men-at-arms.

NEVIN, ETHELBERT (1862–1901), American composer, was born at Edgeworth, Pa., Nov. 25, 1862. His musical talent displayed itself in childhood. He studied in Boston, 1884, before going to Berlin to continue work under Klindworth and Von Buelow, who encouraged his ability as composer. After teaching in Boston (1887–93), he returned to Europe residing for a time in Paris, Berlin, Florence and Venice as well as in Algiers. In 1900 he went back to the United States, becoming associated with Horatio Parker in the department of music at Yale university. He died at New Haven, Conn., Feb. 17, 1901. Ranked with the foremost of American song-writers, he was also the composer of many instrumental pieces, mostly in miniature form, marked by a delicate, melodious originality. Among his compositions were *Water Scenes* for the piano, including the favourite *Narcissus;* a piano suite, *In Tuscany;* the song cycles, *In Arcady* and *The Quest of the Heart's Desire,* the latter posthumously published as was also *Tempo di Valse;* a *Sketch Book* of songs and piano music; and *The Rosary,* the song that became instantly popular at a concert at Madison Square Garden, New York, Feb. 15, 1898.

See J. T. Howard, *Ethelbert Nevin* (1935).

NEVIS, an island in the British West Indies, forming with St. Kitts one of the four presidencies in the colony of the Leeward Islands. Pop. (1946) 11,388. It lies in 17° 14′ N. and 62° 33′ W., and is separated from St. Kitts by a shallow channel 2 mi. wide at its narrowest point. The island is almost circular, and from the sea has the appearance of a perfect cone, rising gradually to a height of 3,596 ft. Total area, 50 sq.mi. Average temperature, 82° F. Sea-island cotton is the chief crop, and some sugar is raised. Agriculture is almost entirely in the hands of small proprietors. Charlestown, the chief town and port, lies on the southwest coast. Alexander Hamilton, drafter of the U.S. constitution, was born there in 1757. Discovered by Columbus in 1493, Nevis was first colonized by the English in 1628; captured by the French in 1782, it was restored to Britain the next year.

NEW ACADEMY. Plato's school is known as the Academy, or the older Academy. For some time after Plato's death the school continued true to his teaching. But in the third century B.C., when Arcesilaus (316–241 B.C.) was head of the Academy, there came a great change. Arcesilaus developed a sceptical philosophy in opposition mainly to the Stoics. To mark this change in the trend of its teaching the school became known as the New Academy. (*See* PLATO; ACADEMY, GREEK.)

NEW ALBANY, a city of southern Indiana, U.S., on the Ohio river, opposite Louisville, Ky.; county seat of Floyd county. It is on federal highways 31 and 150, and is served by the Baltimore and Ohio, the Chicago, Indianapolis and Louisville, the Pennsylvania and the Southern railways and river steamers. Pop. (1950) 29,297; (1940) 25,414. The city is on a plateau above the river and is surrounded by hills rising more than 600 ft. above the river. It has 48 manufacturing industries with an output of about $45,000,000; the leading products are plywood, furniture, iron and steel, edge tools, engines and boilers, men's clothing, leather, fertilizers and flour. Agriculturally, New Albany and vicinity produce more than $500,000 worth of strawberries annually. Dairy products are second in volume. A state tuberculosis sanatorium, Silvercrest, was completed in 1940. New Albany was platted in 1813 and chartered as a city in 1839.

NEW AMSTERDAM, a town of British Guiana, situated in 6° 20′ N. and 57° 30′ W. on the east bank of the Berbice river, about 4 mi. from the mouth. Formerly the capital of the colony of Berbice, it is now the capital of the county of that name. It is composed almost entirely of wooden houses, having a population of 9,567 (1946 census). Colony house, standing in handsome grounds beside the botanical gardens, formerly the residence of the governor and seat of the legislature, now contains the treasury and supreme courts. New Amsterdam is connected by ferry, rail and a biweekly steamer service with Georgetown.

NEWARK, DAVID LESLIE, LORD (1601–1682), Scottish general, fifth son of Sir Patrick Leslie of Pitcairly, Fifeshire, commendator of Lindores, and Lady Jean Stuart, daughter of the

1st earl of Orkney. In his early life he served in the army of Gustavus Adolphus, where he rose to the rank of colonel of cavalry. In 1640 he returned to Scotland. He was major general under Alexander Leslie, earl of Leven, at Marston Moor. He was then sent into the northwestern counties, and besieged and took Carlisle. When, after the battle of Kilsyth, Scotland was at the mercy of the earl of Montrose and his army, Leslie was recalled from England in 1645, and made lieutenant general of horse. In September he surprised and routed Montrose at Philiphaugh near Selkirk. He was then declared lieutenant general of the forces. After a short period of service in England he returned to Scotland, and reduced several of the Highland clans.

In 1650 Newark was sent against Montrose, who was defeated and captured by Maj. Archibald Strachan, Leslie's advance guard commander; and later in the year, all parties having for the moment combined to support Charles II, Leslie was appointed to the chief command of the new army levied on behalf of Charles II. The result, though disastrous, abundantly demonstrated Leslie's capacity as a soldier, and it might be claimed for him that Oliver Cromwell and the English regulars proved no match for him until his movements were interfered with and his army reduced to indiscipline by the representatives of the Kirk party that accompanied his headquarters. After Dunbar Leslie fought a stubborn defensive campaign up to the crossing of the Forth by Cromwell, and then accompanied Charles to Worcester, where he was lieutenant general under the king. On the defeat of the royal army Leslie was committed to the Tower, where he remained till the Restoration in 1660. In 1661 he was created Lord Newark, and received a pension of £500 per annum. He died in 1682. The title became extinct in 1790.

NEWARK, a town of New Castle county in northwestern Delaware, U.S.; the altitude is 135 ft. It is served by the Baltimore and Ohio and the Pennsylvania railroads, and is on state highway 2. The population was 6,701 in 1950, 4,502 in 1940 and 3,899 in 1930 by the federal census. Newark was one of the first intersections between the Chesapeake and Delaware rivers where white travellers met, exchanged supplies and secured fresh horses. In 1758 it was licensed to hold fairs twice a year, and markets weekly, for the exchange of local agricultural produce. The Revolutionary army passed through the town in 1781 during Gen. George Washington's drive on Yorktown. The first sizable industry, a paper mill, was founded there before 1798 and the first local church was erected by Methodists in 1812. By 1836 the line of the present Pennsylvania railroad reached Newark and in 1852 the town received its charter; it was reincorporated in 1887. Newark is the seat of the University of Delaware, the state university, which had its origins in a small colonial school founded near New London, Pa., in 1743. The school was later removed to Newark and became the Newark academy. There is a public library in the town, and also the University of Delaware Memorial library, which specializes in chemistry and has a collection of Delawareana. The chief manufactures include fibre and fibre products, paper and chemical containers. Agricultural products include corn, wheat and apples. A newspaper, founded in 1910, is issued weekly.

NEWARK, a municipal borough in the Newark parliamentary division of Nottinghamshire, England. Pop. (1938) 20,330. Area 5.3 sq.mi. It lies on the Devon near its junction with the Trent and is connected with the Trent navigation by a canal 1½ mi. in length. It is 120 mi. N.N.W. from London by the L.N.E.R. Newark owed its origin, possibly in Roman times, to its position on the great road called the Fosse Way, in the Trent valley. Granted to the monastery of Stow by Godiva, it remained in the hands of the bishops of Lincoln until the reign of Edward VI. The castle was erected by Bishop Alexander in 1123, and the bridge about the same time. It was incorporated in 1549, and the charter was confirmed and extended by Elizabeth.

A weekly market on Wednesdays, and a fair on the eve, day and morrow of the Invention of the Holy Cross, are still held; another fair at St. Mary Magdalene and the four preceding days was granted by Henry III and is probably represented by the fair now held on May 14. A market for corn and cattle is still held on Wednesdays, and another on Tuesdays for fat stock has been added. The church of St. Mary Magdalene is notable for its tower and octagonal spire (223 ft. high). Its central piers, dating from the 11th or 12th century, remain, and the lower part of the tower is Early English. The upper parts of the tower and spire are Decorated, completed about 1350; the nave dates from between 1384 and 1393 and the chancel from 1489. There are a few old monuments and a 14th-century brass. The castle is supposed to have been founded by Egbert, king of the West Saxons. It was known as the "key of the North." The Norman stronghold still shows a gatehouse, a crypt and the lofty tower. The building seems to have been reconstructed in the early part of the 13th century. During the Great Rebellion it was garrisoned for Charles I and endured three sieges. A late 15th-century cross (the "Beaumond" cross) is in the town. A grammar and song school was founded in the reign of Henry VIII.

The town trades in malt, coal, corn and cattle. There are iron and brass foundries, boilerworks, agricultural implement manufactories and breweries. Gypsum and limestone are obtained in the neighborhood.

NEWARK, the largest city of New Jersey, U.S., a port of entry and the county seat of Essex county; on the Passaic river and Newark bay, 8 mi. W. of lower Manhattan (New York city). It is served by the Central of New Jersey, the Erie, the Lackawanna, the Lehigh Valley and the Pennsylvania railways; steamship lines operating to Atlantic, Gulf and Pacific ports; by trolleys entering the city's business centre via subway, motor bus and truck lines in all directions; and the Hudson and Manhattan railway, which provides 178 trains daily to and from New York via tubes under the Hudson river; federal highway 1 and state highway 25 (over a high-level super bridge structure known as the Pulaski skyway).

The Newark Metropolitan airport was one of the pioneer U.S. airports. It was opened in 1928 and together with Port Newark is leased and operated by the Port of New York authority.

Population in 1950, according to the federal census, was 437,857. This is more than doubled by the adjacent cities and suburbs, including the Oranges, Belleville, Nutley, Bloomfield, Montclair, Irvington, Maplewood, Elizabeth, Kearny, Arlington, Harrison and Bayonne. The city has an area of 23.6 sq.mi.; 13 mi. of water front, 375 mi. of streets (357 mi. paved). The site, bordered on the east by the Passaic river, is generally level, but rises gradually toward the west.

Port of Newark faces Newark bay at the mouth of the river. The city is laid out in an irregular pattern. It is closely built up in the business sections, largely with tall structures of modern type. Many of the older buildings are of a native brown sandstone. Broad street (120 ft. wide) and Market street (90 ft.) are the principal thoroughfares, and their intersection (the "Four Corners") is one of the busiest traffic points in the world. Near by is Military park (an irregular plaza used in colonial days as a drill ground), surrounded by public and semipublic buildings (including the Public Service terminal, completed in 1916). In this park is a magnificent bronze group of 48 figures on a gigantic scale, "The Wars of America," by Gutzon Borglum.

Facing Washington park, also near the heart of the city, are the public library and the Newark Museum of Industry, Art and Science (opened 1926). Conspicuous among the city's business structures are the buildings of the Prudential and various other insurance companies as well as that of the New Jersey Bell Telephone company. The county courthouse, designed by Cass Gilbert, has mural decorations by well-known American artists, and in front of it is Gutzon Borglum's seated statue of Abraham Lincoln (in bronze). The hall of records, opposite the courthouse, was completed in 1928. Completion of a union railway and trolley station in 1937 enabled abolition of Manhattan Transfer in the New Jersey meadows and involved the construction of Newark's first subway. Among the noteworthy old buildings are the Trinity Episcopal cathedral, near Military park, built in 1743 and used as a hospital during the Revolution; the House of Prayer with its stone rectory, more than 200 years old; and the Old First Presbyterian church, founded 1666.

There are 44 playgrounds, with a combined area of 42 ac., and the parks within the city limits cover 951 ac., of which 912 ac. are part of the Essex county park system aggregating 3,833 ac.

In 1917 the city adopted a commission form of government. Five commissioners, elected at large every four years, constitute the governing body. Each commissioner is the director of one of the five departments of the city's business (public affairs, public works, revenue and finance, public safety, parks and public property). The commissioners elect one of their own number as mayor. The public schools are administered by a nonpartisan board of nine members (appointed). The city's water supply from the Pequannock river watershed (57,000,000 gal. daily) in recent years has been increased by the development of the Wanaque watershed (a joint project of eight north Jersey municipalities), which supplies a total of 100,000,000 gal. a day, of which 40,500,000 are allotted to Newark.

The quality of water supplied is equalled by that of but very few large cities. The sewage from Newark and 21 other municipalities is disposed of through trunk sewers (operated by the Passaic Valley Sewerage commission) into strong tidal currents well out into New York bay.

The public school system comprises 49 elementary, 7 senior and 3 junior high schools, 1 continuation school and 11 evening schools. There are 2 vocational schools under county direction in the city; 27 parochial schools and several private academies, including Newark academy, founded in 1774. The public library and museum have been pioneers in developing unconventional methods of serving the people.

The library has 621,966 volumes and an annual circulation of 2,314,977. The museum has exhibits valued at more than $1,200,000. The New Jersey Historical society, with its exhibits and records, adds to the city's cultural assets. There are several special libraries in the city, including the Prudential Insurance company's valuable collection on vital statistics. Newark is the seat of the Newark College of Engineering (1885); the New Jersey College of Pharmacy (1891), now affiliated with Rutgers university, the state university of New Jersey. The Newark colleges of Rutgers university include facilities of the former University of Newark. There is also a state teachers college. There are about 300 churches and congregations and Newark is the see of both a Roman Catholic and a Protestant Episcopal bishop. The philanthropic institutions and agencies are united in a welfare federation, financed by an annual community chest campaign. Daily newspapers are: *Newark Evening News* and *Star-Ledger* (morning). Sunday newspapers are the *Sunday Call* and *Star-Ledger*.

Newark has long been one of the leading manufacturing centres of the country. The industries are highly diversified. Among the principal products are paints, pigments and varnishes; electrical apparatus, machinery and supplies; malt liquors; bread and other bakery products; meat packing, wholesale; chemicals; leather; machinery; jewellery. Newark is one of the important retail trade and wholesale trade centres as well. As an insurance centre also it has been long important. The ten large life, fire and casualty companies having their home offices there employ about 14,000 persons in Newark and have assets aggregating more than $5,115,000,000. It is an important transportation centre by rail, highway, air and sea and it is a prominent distributing point for many of the nation's leading products. Its development as a seaport is comparatively recent. In 1914 the city began the creation of the Port of Newark, later leased and operated by the Port of New York authority, as a shipping terminal and industrial centre. With aid from the federal government the channel was deepened to 30 ft. and widened to 400 ft. More than 2,000 ac. have been prepared on reclaimed land for industrial sites, 10 public and 133 private docks and piers have been built.

In 1666 (following the union of the towns of the New Haven jurisdiction with Connecticut in 1664, and the consequent secularization of the franchise) a band of about 30 Puritans from Milford, Conn., led by Capt. Robert Treat, settled at "Four Corners," and the next year they were joined by an equal number from Branford and Guilford, Conn. They bought practically all of what now is Essex county from the Indians for "fifty double hands of powder, one hundred bars of lead, twenty axes, twenty coats, ten guns, twenty pistols, ten kettles, ten swords, four blankets, four barrels of beer, ten pairs of breeches, fifty knives, twenty horses, 1850 fathoms of wampum, six ankers of liquor (or something equivalent), and three troopers' coats." The name was chosen in honour of their pastor, the Rev. Abraham Pierson (1608–78), who came from Newark-on-Trent, England. For 50 years or more the town remained essentially Puritan and was governed largely according to the Mosaic law. About 1730 Presbyterianism superseded Congregationalism. and in 1734 Col. Josiah Ogden (who had caused a schism by saving his wheat one dry Sunday in a wet season) led in founding the first Episcopal church (Trinity). Newark was incorporated as a township in 1693 and was chartered as a city in 1836. The townships of Orange and Bloomfield were set off from it in 1806 and 1812, respectively. From 1747 to 1756 the College of New Jersey (now Princeton university) was carried on there, under the presidency after the first few months of the Rev. Aaron Burr, who published in 1752 his famous textbook, the *Newark Grammar*. The manufacture of leather (especially patent leather) and shoes early became an important industry. There was a tannery there in 1770 and by 1837 there were 155 curriers and patent-leather makers. The jewellery industry dates from about 1830. Newark was the home of Seth Boyden (1788–1870), called by Thomas A. Edison "one of America's greatest inventors," who invented the processes for making patent leather (1818) and malleable cast iron (1826), besides many new machines and many improvements on older apparatus; of the Rev. Hannibal Goodwin, who in 1887, in the attic of the rectory of the House of Prayer, invented the flexible film which made the motion picture possible; and of Edward Weston, inventor of electrical measuring instruments. The city's population was 38,894 in 1850; 71,941 in 1860; 136,508 in 1880; and 246,070 in 1900. Between 1900 and 1910 it increased 41%; between 1910 and 1920, 19%; and between 1920 and 1930, 6.7%. Between 1930 and 1940, it decreased 2.8%. (R. W. Bt.; X.)

NEWARK, a village of Wayne county, New York, U.S., 30 mi. E. of Rochester on the state barge canal, and served by the Marion, the New York Central, the Pennsylvania and the West Shore railways. Pop. (1950) 10,275; in 1940 it was 9,646 by federal census. Twenty miles north are the summer resorts on Sodus bay (Lake Ontario), and Lakes Seneca and Canandaigua lie 15 mi. and 18 mi. respectively to the south. Newark has extensive nurseries (it is the rose centre of the U.S.) and a great variety of manufacturing industries with an aggregate business of $16,000,000 annually at mid-20th century. It is the seat of a state school for mental defectives.

The village was founded about the time of the opening of the Erie canal (1825) and was incorporated in 1839.

NEWARK, a city of central Ohio, U.S., 33 mi. E. by N. of Columbus, at the confluence of the north and south forks of the Licking river; the county seat of Licking county. It is served by the Baltimore and Ohio, Pennsylvania and New York Central railways. Pop. (1950) 34,178; (1940) 31,487; in 1930 it was 30,596 by the federal census. The city lies 820 ft. above sea level, in a broad, fertile valley, surrounded on three sides by low hills. It is an important industrial centre, manufacturing spun glass, electric ranges, glassware, aluminum wire and cable, petroleum products, rope and fabricated steel. In Newark and its vicinity are some of the most extensive and best preserved earthworks of prehistoric mound builders. When first observed (about 1800) by white settlers, the mounds were covered with dense forests containing trees more than 500 years old. Newark was first settled about 1801, its original plat was recorded in 1803 and the community was incorporated in 1826.

Denison university (Baptist, 1831) is located 6 mi. W. of Newark in Granville. Ten miles S. is Buckeye lake, and 5 mi. E. is Flint Ridge State park, in which flint pits used by many North American Indians are preserved. (*See* also Newark Works.)

NEWARK WORKS. An elaborate and complicated group of prehistoric works at the junction of two branches of Licking river, near Newark, Licking county, Ohio. Situated on a plain

30 to 50 ft. above the bottom land, the works consist of a series of square, circular, and octagonal enclosures, with mounds, ditches and connecting avenues spreading over nearly 4 sq.mi. They are composed of two groups, nearly 2 mi. apart, connected by two walled avenues averaging 200 ft. wide. The western group consists of a large circle, 3 to 14 ft. high and with a mean diameter of 1,054 ft., connected with a symmetrical octagon by an avenue 300 ft. long and 80 ft. wide. Outside the octagon are two small circles, and at each corner of the octagon is a gateway, opposite which and 60 ft. within is a small mound 3 to 6 ft. in height.

The length of the walls between the centres of the gateways averages 621 ft., from which the greatest variation is only four ft., except in one wall that falls 8 ft. short of the average. From the south side of the octagon a walled avenue stretches southward 2 mi. or more, and from near its east side two similar avenues extend eastward with a low wall on each side, one connecting with the square of the eastern group, the other running east to the descent to the lowland north of the square. Disposed along these avenues are circles.

The eastern group of the works consists of a large circle connected with the square mentioned by a broad avenue and several adjoining lines of walls. The wall of the circle is accompanied with an inside ditch 28 to 40 ft. wide and 8 to 13 ft. deep, while the wall itself is 35 to 55 ft. wide at the base and from 5 to 14 ft. high.

There is a gateway at the northeast with flanking extensions of the wall into the walled avenue leading to the square, the sides of which are 926 to 951 ft., yet the angles at the corners do not vary from the right angle more than one degree.

NEW BEDFORD, a city of Massachusetts, U.S., 56 mi. S. of Boston at the mouth of the Acushnet river, on an arm of Buzzards bay; a port of entry and one of the county seats of Bristol county.

It is on federal highway 6 and is served by the New York, New Haven and Hartford railroad, by Northeast Airlines and by motorbus lines and steamboats. Pop. in 1950 was 109,189; and in 1940 was 110,341.

The city occupies 19.1 sq.mi. along the west side of the river and harbour, opposite Fairhaven, with which it is connected by two highway bridges.

It is in the heart of the summer resort region of southern New England and is the port of sailing for the islands of Nantucket and Martha's Vineyard. The harbour is a tidal estuary, with a 30-ft. channel 350 ft. wide and a 14-ac. turning basin above the bridge.

Boulevards almost encircle the city, including a broad drive along the shore of the harbour to Clark's point, where Ft. Rodman (erected during the Civil War) guards the entrance. There are some handsome modern buildings, including the post office, the municipal building, the library and the high school. The library, established by a private society in 1802 and taken over by the city in 1853, was one of the first free public libraries in America. It has a fine collection of whaling prints and other material relating to the industry and much historical material relating to the Quakers.

The Bourne Whaling museum contains, among other exhibits, a half-size reproduction of Jonathan Bourne's favourite full-rigged whaling bark "Lagoda"; the walls are adorned with harpoons, darting guns and lances.

In the Seamen's Bethel (1831) just across the street are the black-bordered marble memorial tablets engraved in terms of bitter and hopeless grief which Herman Melville described in *Moby Dick.*

Free educational opportunities, in addition to those provided by the public-school system, are offered by a state textile school, the New Bedford vocational school and the Swain Free School of Design. Daily papers are published in French and in Portuguese.

New Bedford has long been one of the principal centres for the manufacture of fine cotton goods. It is the spot cotton market of the north, and its warehouses have a large storage capacity. The traffic of the harbour in 1949 aggregated 605,751 net tons, the bulk of which was receipts. In addition there are large shipments of fish.

The city's assessed valuation for 1948 was $112,000,000.

The site of New Bedford was visited in 1602 by Bartholomew Gosnold, who traded with the Indians at the mouth of the Acushnet. It was originally part of the town of Dartmouth, settled in 1652 by colonists from Plymouth who purchased the land from Massasoit. About 1665 there was a considerable influx of Quakers, who have ever since been an important and influential element in the population. There was no village on the site of the present city until 1760.

In 1787 New Bedford was set off from Dartmouth and incorporated as a town, and in 1847 it was chartered as a city. Fairhaven was separated from it in 1812.

The town was at first called Bedford (the family name of Joseph Russell, one of the founders), and later New was prefixed to distinguish the town from Bedford in Middlesex county. On May 14, 1775, a local ship captured two armed British sloops just outside the New Bedford harbour.

During the Revolution the harbour was a rendezvous of American privateers, and this led to an attack (Sept. 5, 1778) by a fleet and armed force under Earl Grey, which burned 70 ships and almost destroyed the town.

The whaling industry became established there after Joseph Rotch, a Nantucket merchant, built wharves and warehouses on the west side of the harbour in 1765, and New Bedford was long the principal whaling port of the world.

For more than a century the industry flourished, with interruptions due to the Revolution, the embargo, the War of 1812 and the Civil War, reaching its peak in 1857 when 329 whaling ships were registered, representing an investment of $12,000,000 and employing 10,000 men ashore and afloat. The hunting grounds shifted after 1791 from off the Virginia and Carolina coast to the Pacific, and after 1848 to the arctic waters.

The first cotton mill was built in 1847 by Joseph Grinnell (1789–1885) and his associates, and began operation in 1848 with 15,000 spindles and 200 looms.

NEW BERN, a city of eastern North Carolina, U.S., at the mouth of the Trent river, on the Neuse river estuary; a port of entry and the county seat of Craven county. It is on federal highways 17 and 70; is connected by a 12-ft. channel with the inland waterway from Boston, Mass., to Miami, Fla.; and is served by the Atlantic Coast Line, the Norfolk Southern and the Atlantic and East Carolina railways; by the National and the Piedmont airlines and by coastwise steamers. Pop. 15,812 in 1950, and in 1940, 11,815 by the federal census.

The Neuse river is 1½ mi. wide there, and it widens gradually to 7 mi. at its entrance into Pamlico sound, 30 mi. east. New Bern is a picturesque old city, on the peninsula formed by the two rivers, surrounded by forests of cypress and pines. It is the supply depot and commercial centre of the rich surrounding farm lands and of the numerous fishing and hunting resorts of the region (Ocracoke, Morehead, Beaufort, Jacksonville, Havelock, Nags Head and Cape Lookout).

The city's manufacturing industries include the largest lumber mill in the southeast, boat building, needle trades, chemicals and wood products.

New Bern was founded in 1710 by a company of Germans and Bernese Swiss in search of religious freedom, under the leadership of Baron Christopher de Graffenried, and was incorporated as a city in 1723. The general assembly met there in 1738. In 1749 a printing press (the first in North Carolina) was set up, and the first academy in the province was established. For some years the city was the capital of the province, and it was the leading seaport until the Revolution. Many beautiful old buildings still stand, including one wing of "Tryon's Palace" (the residence of the royal governor, built in 1767–70, and reputed the finest structure in America at the time), the Presbyterian church (1822), and Christ church, which has a communion service presented by George II in 1752.

The city was strongly fortified early in the Civil War, but was captured by Federal troops on March 14, 1862, and subsequent

attempts by the Confederates to retake it (March 14, 1863, and Feb. 1 and 5, 1864) were unsuccessful.

NEWBERRY, JOHN STRONG (1822–1892), U. S. geologist, was born at Windsor, Conn., on Dec. 22, 1822. He was graduated from Western Reserve university at Cleveland, O., in 1846 and from Cleveland Medical college in 1848, and completed his medical studies in Paris.

In 1851 he began the practice of medicine in Cleveland, but abandoned it to accept an appointment as surgeon and geologist with an exploring party in northern California and Oregon. His reports on the geology, botany and zoology of the expedition were published in 1857.

For the next four years he was employed on similar work in the region of the Colorado river, his researches extending over a large area in Utah, Arizona and New Mexico. In 1866 he was appointed professor of geology and palaeontology at the Columbia School of Mines, New York, where he commenced the formation of a magnificent collection of specimens. In 1869 he was made state geologist of Ohio and director of the second geological survey of that state, and in 1884 palaeontologist to the U.S. geological survey.

He devoted much study to Triassic, Cretaceous and Tertiary plants, and in particular to those of the Larami stage. He also carried on researches among the Palaeozoic and Triassic fishes of North America.

Among his other publications may be mentioned *The Origin and Classification of Ore Deposits* (1880). He died at New Haven, Conn., on Dec. 7, 1892.

See a bibliography of his publications in *Bulletin of Geol. Soc. of America*, vol. iv. p. 393 and "Memoir" (with portrait) by J. J. Stevenson in *American Geologist* (July, 1893).

NEWBERRY, a town of South Carolina, U.S., the county seat of Newberry county; on federal highways 76 and 176, 43 mi. N.W. of Columbia.

It is served by the Columbia, Newberry and Laurens and the Southern railways. Pop. (1950) 7,546. It is a cotton market and cotton-manufacturing centre, with more than 200,000 spindles in its mills. The lumber industry, livestock and pulpwood are important.

It is the seat of Newberry college (1856). The town was settled in 1832 and was incorporated in 1894.

NEWBOLT, SIR HENRY JOHN (1862–1938), English author and poet, was born on June 6, 1862, the son of H. F. Newbolt, vicar of St. Mary's, Bilston. He was educated at Clifton college, and at Corpus Christi college, Oxford. He was called to the bar at Lincoln's Inn in 1887 and practised until 1899. His first book was a story, *Taken from the Enemy* (1892), and in 1895 he published a tragedy, *Mordred;* but the publication of his ballads, *Admirals All* (1897), created his literary reputation. These were followed by other volumes of stirring verse, *The Island Race* (1898), *The Sailing of the Long-ships* (1902), *Songs of the Sea* (1904). From 1900 to 1905 he was editor of the *Monthly Review.* His novels *The Old Country* (1916) and *The New June* (1909), attracted attention. During the World War he was controller of wireless and cables. He was knighted in 1915. In 1914 appeared *Drake's Drum and other Sea Songs,* and *Aladore;* his chief contribution to war poetry was *St. George's Day and Other Poems* (1918). In 1920 he published his *Naval History of the Great War.*

His other works include:—*Tales of the Great War* (1916), *The Book of the Happy Warrior* (1917), and *Submarine and Anti-Submarine* (1918), written primarily for the young; *A New Study of English Poetry* (1917); *Poetry and Time* (1919); *An English Anthology* (1921); *Studies Green and Gray* (1926); *New Paths on Helicon* (1927); and *Naval Operations—1917 to the Armistice.*

NEW BRIGHTON, a community on the northeast shore of Richmond borough (Staten island), part of New York city, U.S.A., since 1898. It is at the northeastern end of Staten island, about 6 mi. S.W. of the borough of Manhattan. At New Brighton is the Sailors' Snug Harbour, founded under the will of Robert Richard Randall (*c.* 1740–1801), who in 1771 became a member of the Marine Society of New York (an organization for the relief of indigent masters of vessels and their families), and in 1790 bought from Baron Poelnitz the "Minto farm," about 21 ac. of land in what is now the borough of Manhattan. This tract, with four lots, also in what is now Manhattan, and cash and stocks to the value of about $10,000 Randall bequeathed to a board of trustees, directing that the income should be used "for the purpose of maintaining and supporting aged, decrepit and worn-out sailors," who had served at least five years under the American flag, and that the institution established for this purpose should be called "the Sailors' Snug Harbour." The Sailors' Snug Harbour was incorporated in 1806, and its charter was amended in 1828 to permit the building of the institution on Staten island rather than on the Randall estate, which had already greatly increased in value. In 1833 the institution, with lands covering 160 ac., was opened in New Brighton with about 50 inmates. Randall's body was removed to the grounds in 1834, and in 1884 a life-size bronze statue of him, by Augustus Saint-Gaudens, was placed in front of the main building. At New Brighton are located Curtis and St. Peter's high schools, Staten Island academy, the Staten island branch of Manhattan college, Staten Island hospital, and the Staten Island Institute of Arts and Sciences museum.

See I. K. Morris, *Memorial History of Staten Island* (1900); C. G. Kolff, *A Short History of Staten Island* (1926); and Leng and Davis, *Staten Island and Its People* (1930).

NEW BRITAIN, an island of the Bismarck archipelago, lying east of New Guinea, in the Pacific ocean, between 5° and 6° S., and 150° E. (German, *Neu Pommern;* native, *Birara*). It formed part of the colony of German New Guinea from 1884 (when the German protectorate was declared), until 1914, when it was occupied by Australian troops, and in 1919 it was mandated by the League of Nations to the commonwealth of Australia, until its occupation by the Japanese in Jan. 1942. Rabaul, the administrative centre and principal town, became a major Japanese base in the naval and air war between the Japanese and the U.S. and Australian forces under the command of General Douglas MacArthur (*q.v.*). It was a frequent scene of concentrations of Japanese shipping and of United Nations air attacks. It is long and narrow, almost crescent in shape, about 300 mi. long, with a width varying between 28 and 50 mi. The largest island in the archipelago, its total area is about 10,000 sq.mi. The population of the patrolled areas in 1940 was 90,349.

Little explored and little developed, New Britain, despite its narrowness, had never been crossed by a white man by the time of World War II except at its northern extremity, because it is bisected from east to west by rugged mountain chains. The highest peak on the island, the Father (7,546 ft.), is an active volcano. There are no rivers of any importance, only a few swift streams.

Although the location of Rabaul (non-native population 4,674 in 1940) is open to some criticism (it is on a swamp in an earthquake zone and against an active volcano), the town was built with rather typical German solidity and possesses an excellent harbour, a consideration which doubtless induced the Japanese to select it as a major base. Most of the white population lives in the neighbourhood of Rabaul.

Coco-nut plantations represent the principal agricultural activity of the island. The largest cultivated area (83,913 ac. in 1940) is on the Gazelle peninsula, on the northern shore of the island. Other plantations are located on the southern shore. There are several excellent harbours and anchorages along the shores of the island, Simpson harbour, in Blanche bay, being most frequently used. Copra is the principal product of New Britain, with shell fishing an important subsidiary industry. Most of the copra is shipped from Rabaul, which is ordinarily a port of call for ships from Australia, the Solomons and other regions of the southwest Pacific.

The island is divided into four administrative districts: Rabaul, Kokopo (the former Herbertshöhe, seat of the German administration of New Guinea), Gasmata and Talasea. While the interior has been largely left to the aborigines, roads are gradually extending the area where travel is safe. A good deal of communication is by steamer, and in normal times there is regular service between Rabaul and the smaller ports of New Britain and the ports of New Guinea and Australia.

The natives of New Britain are Melanesians, with dark skins and

frizzy hair. They are akin to the natives of New Guinea (*q.v.*) in customs and language. Old practices of cannibalism and headhunting are to be found in the remote interior districts, but have largely disappeared in the coastal areas with the building of roads and the establishment of a more settled administration. A curious kind of pidgin English developed for communication between the Europeans and the natives, who can be trained as workers and sometimes show considerable intelligence.

Vulcan Island, with an area of several acres, appeared on the south side of Blanche bay during an eruption of a volcano known as Mount Mother.

An eruption of the Matupi and Vulcan volcanoes, near Rabaul, on May 29, 1937, killed 263. (W. H. Ch.)

NEW BRITAIN, a city of Hartford county, Conn., U.S., 9 mi. S.W. of Hartford; served by the New York, New Haven and Hartford railway. The population was 73,726 in 1950 and 68,685 in 1940 by the federal census.

The seat of the Teachers College of Connecticut (chartered 1849) and a state trade school, the city is an important manufacturing centre, with an output in 1952 valued at about $250,000,000. Wages paid in that year totalled more than $90,000,000. Hardware, ball bearings, electrical appliances, hand tools, automatic machines, cutlery and edge tools, metal cabinets, suits, buckles, zippers, air conditioning units and machine-shop products are the leading manufactures.

Settlement within the territory occupied by New Britain began in 1687. The town of New Britain was incorporated in 1850, and the city was incorporated in 1871. In 1905 the two were consolidated.

NEW BRUNSWICK, a province of Canada, lying between approximately 44° 37′ and 48° 3′ N. and 63° 46′ and 69° 3′ W. Its length from north to south is 230 mi.; its greatest breadth, 190 mi.; and it has a seaboard of about 550 mi.

Geological and Physical Features.—The geological aspect of New Brunswick is fully treated in the article CANADA. Geographically, the province represents the land area of the eastern coast of Canada surrounded by the Bay of Fundy, Northumberland strait, the Gulf of St. Lawrence and the Baie des Chaleurs. It comprises the entire basin of the river St. John, a river 399 mi. long, flowing into the Bay of Fundy and navigable for 88 mi. to Fredericton, and for small boats for 65 mi. farther. The province includes also the basin of the Miramichi and lesser rivers entering the Gulf of St. Lawrence and the southern half of the basin of the Restigouche entering the Baie des Chaleurs. The upland areas thus drained reach in places a height of 2,000 ft. above sea level and form in the centre of the province an unbroken forest country, little occupied or reached by railways or highways as late as mid-20th century. All the lower valley of the St. John and many coastal parts of the province represent first-class agricultural land; and the coast line, especially along the Bay of Fundy, is well settled and offers a chain of commodious harbours. The high tides of the bay, reaching to 70 ft., occasion the peculiar phenomenon of the reversible waterfall at the mouth of the St. John and the rush of the tidal bore at the head of the Bay of Fundy. Only on its western side has New Brunswick in part a nongeographical boundary, the 69° 3′ meridian, a compromise line (Ashburton treaty, 1842) resulting from the search to find the "northwest angle" of Nova Scotia supposed (1783) to separate Nova Scotia from Massachusetts (later Nova Scotia from Maine).

Climate.—The cold air of the northern interior frequently flows over the province in winter. The average rainfall is 40 to 45 in. The snowfall is very heavy in the north of the province, where it exceeds 100 in. The harbour of Saint John is open throughout the year.

History.—Until 1784 New Brunswick formed part, first of the French province of Acadia, later of the British province of Nova Scotia. The first settlement within its borders was made in 1604 by Pierre de Guast, sieur de Monts, with whom was Samuel de Champlain. Their colony at the mouth of the St. Croix river was soon abandoned, but throughout the French regime the district was frequented by bands of fur traders. In 1762 the first English settlement was made at Maugerville, on the St. John river, and in 1764 a body of Scottish farmers and labourers took up land along the Miramichi.

Scattered French settlers located themselves on the mainland side of the Bay of Fundy. They numbered about 4,500 at the time of the expulsion of their kindred across the bay, and their numbers were increased by about 500 of these as refugees.

After the American Revolution the great influx of loyalists into the valley of the St. John led to the separation of New Brunswick from Nova Scotia in 1784. The close of the Napoleonic wars in 1815 brought a constant influx of immigration from Great Britain. The province had 74,000 inhabitants by 1824.

New Brunswick shared with Nova Scotia, in the middle period (1815–67), the prosperous development that arose from lumbering, shipbuilding and the fisheries, and (until 1849) from the preference of the British market for colonial timber and the effect of the Navigation acts (till 1849) in giving the maritime provinces the West Indian trade denied the United States. This occasioned a relative neglect of agriculture and led many immigrants to prefer settlement in upper Canada. The landmarks in the provincial history include the long diplomatic struggle between Britain and the United States over the delimitation of the boundary according to the cryptic terms of the treaty of 1783 which ended in the compromise of the Ashburton treaty of 1842. Provincial history turned also on the question of responsible government, granted after its adoption in Canada (1841–49) and then on reciprocity of trade with the United States (1854). The 1864 plan of confederation for British North America, urged by Canada as a remedy for deadlock, and by Great Britain after the warning of the American Civil War, found little favour in the province but in 1866 was voted by the legislature as a reaction from the Fenian raids. The 1867 union with Canada, by removing customs revenue and blocking British trade, proved highly unpopular. Hence, the postconfederation history of New Brunswick, as of Nova Scotia, turns on the unsatisfactory relations of the federal and provincial governments: the agitation for repeal, or maritime union, and for economic compensation to offset the dominance of central Canada.

Area and Population.—The area of the province is 27,985 sq.mi., of which 512 sq.mi. are fresh water. The population in 1951 was 515,697. In 1941, 63% of the people were of British descent, descendants of the loyalists who founded the colony or immigrants during the prosperous period of the middle 19th century; and the French numbered about 33%. The French population of the Chignecto isthmus represents, in the main, the original mainland Nova Scotia Acadians who were not included in the expulsion of the Acadians from the Nova Scotia peninsula in 1755. The aboriginal element of Algonkin stock is represented by the remnants of two tribes, the Malicites and the Micmac Indians, whose numbers increased (1871: 1,403; 1941: 1,939).

In 1941 the religion of the population was classified as follows: 46% Roman Catholic, 20% Baptist, 15% United Church, 12% Anglican and 4% Presbyterian. The chief towns (1951 pop.) are Fredericton, the capital, 16,018; Saint John, 50,779, and Moncton, 27,334.

Government.—The British North America act of 1867 and amendments assigned representation at Ottawa as 12 senators until 1873 (10 in 1951), and representation in the house of commons on the proportion of the population to that of Quebec, which has a fixed representation of 65. But the number of members by the British North America act of 1915 must not fall by decline of population below the number of senators, and stood at ten in the elections of 1949.

For the provincial government (capital, Fredericton) there is a lieutenant governor, appointed and paid by the federal government, a legislative assembly of 52 members elected for five years unless sooner dissolved, a premier and ministry on the British constitutional tenure and a fixed civil service nonpolitical tenure.

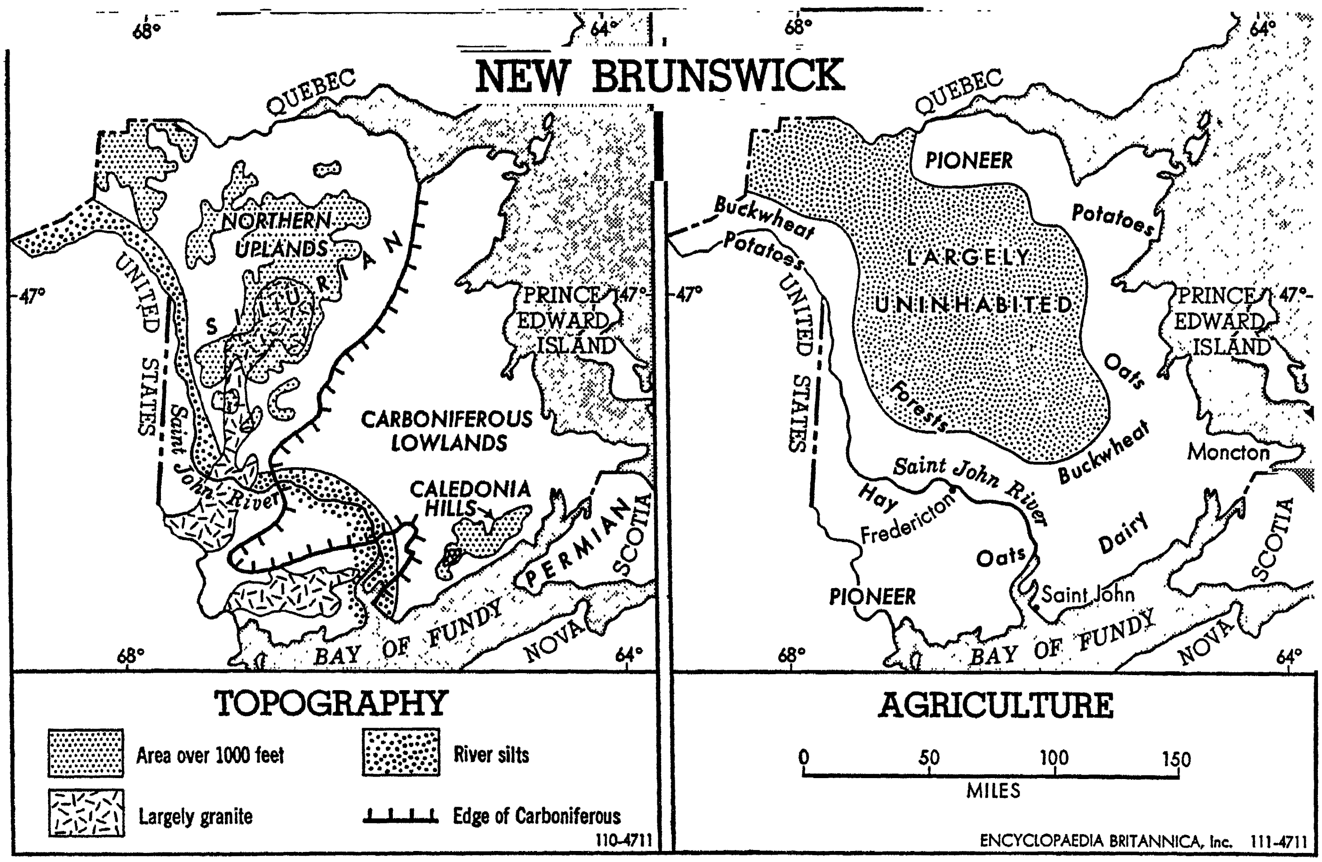
Education.—Almost all primary education is in public schools, nondenominational, compulsory and free of charge. In 1948 the enrolment was 98,331 in public day schools, 2,341 in private day schools and 958 in business colleges. University and college work is carried on in the (Provincial) University of New Brunswick at Fredericton, founded in 1800 and reorganized in 1859; the (Methodist) University of Mount Allison at Sackville; and the Roman Catholic college at Memramcook.

Agriculture.—The province contains a great deal of agricultural land, but by 1951 the larger part of it, 13,300 sq.mi. in a total of 16,750 sq.mi., remained uncleared of forest. The occupied fields and pastures covered only 2,690 sq.mi., and in 1948 there were 31,900 farms which created 22% of that year's total provincial production. In 1951 agriculture was the second ranking producer, being exceeded by forestry. To improve agriculture's position, the provincial government was active in the 1941–51 decade in promoting potato, creamery, poultry, pork and field-crop production. Comparative statistics revealed the consequent trend—field crop acreages: (1941) 871,000, (1949) 934,000; field crop values: (1941) $26,806,000, (1949) $32,129,000. Despite such increases, agricultural production of the province was far below that of Saskatchewan.

Forests.—The most valuable and most widely spread tree is the black spruce (*Abies nigra*), from which is made wood pulp for papermaking. The hemlock (*Abies canadensis*), the cedar, birch, beech, oak, ash and many other valuable trees are also widely spread. The chief ports for shipping are Saint John, at the mouth of the St. John river, and Chatham, at the mouth of the Miramichi.

The great forests, through which flow numerous rivers with excellent harbours at or near their mouths, have long made New Brunswick a centre of lumbering.

The forested land of New Brunswick, including land fit to clear for agriculture and land only of forest utility (lumber, pulpwood), covers about 21,770 sq.mi. of the total 27,473 sq.mi. of land area. Only about 190 sq.mi. of forest are classed as without commercial value. In 1950 the federal government created the 80-sq.mi. Fundy national park.



TOPOGRAPHY: THE RUGGED UPLANDS ARE PRIMARILY IN THE NORTH, WHILE THE LOWLANDS ARE IN THE EAST AND IN THE WEST ALONG THE SAINT JOHN RIVER. AGRICULTURE: FARMING AREAS CORRESPOND RATHER CLOSELY TO THE TOPOGRAPHY WITH THE BEST FARMS IN THE SAINT JOHN VALLEY AND IN THE CARBONIFEROUS LOWLANDS

Statistics (1950) of forest and forest industries in New Brunswick showed accessible standing merchantable timber (conifers and broad-leaved) as 8,950,000 cu.ft., to compare with 63,701,000,000 cu.ft. for Quebec, and 189,051,000,000 cu.ft. for Canada (exclusive of Newfoundland). The lumber production (1948) was 290,434,000 ft. b.m. worth $15,131,000. In 1949 total forest products were worth $113,000,000, of which $68,000,000 was for pulp and paper.

Minerals.—Until 1950 the mineral wealth of the province was small. At various times gold, copper, lead and zinc were worked on a small scale, but in 1950 commercial quantities of those minerals, plus silver, were found in Gloucester county. Iron and plumbago are mined in a limited way. Coal, of which New Brunswick has 11.3% of Canada's total reserves, is actively recovered; and the Hillsborough gypsum deposits are third largest in Canada and high grade. Natural gas with oil is obtained near Moncton.

In 1939 New Brunswick produced about $4,000,000 worth of minerals. A decade later the figure was $7,386,000, highest on record. Coal and gypsum accounted for most of the production.

Environment and Settlement.—The relation of the settlement to the environment is fairly close in New Brunswick. Structurally, the province lies in the western portion of a geological basin, with the oldest Silurian and Ordovician rocks forming uplands more than 1,000 ft. high in the north. These give rise to rather sterile soils, and in consequence the region is forested and almost as empty of settlers as in the earliest days of the province. The southeast half of the area consists of younger rocks belonging to the Carboniferous era (*see* figure), and some coal is worked in beds near Moncton. In the southwest are oval areas of granite which are mostly of Devonian Age and which burst up through the older Silurian deposits. The Caledonia hills are also formed of granite. They give rise to poor soils. The best soils are found along the St. John valley, where river silts to considerable depths are being extensively farmed.

The farmlands correspond fairly closely to the topography. The best farms occur in the St. John valley and in the lowlands formed of the Carboniferous rocks. Excellent potatoes are grown in the northwest in the county of Madawaska, and also by the French fisherman along the northeast coast. The lowlands are given over chiefly to hay and oats, associated with the dairy economy, especially in the region between Saint John and Moncton. As late as mid-20th century there was pioneer farming in the north and southwest (*see* map). Buckwheat is often widely grown in those areas.

Fisheries.—The fisheries of New Brunswick are extensive, though less so than those of Nova Scotia. This industry centres in the counties of Charlotte and Gloucester, herring, salmon, lobsters, sardines and cod forming the chief catch. The Restigouche and other rivers near the northern border are much frequented by anglers in search of trout and salmon.

Federal legislation after 1942 encouraged fishing production by subsidizing construction of small and medium-sized trawlers called draggers, and by financing provision of facilities for freezing and storing bait. In the same period the provincial government set up a special division of fisheries to modernize the industry through a fisheries loan board. Fishery production at market value climbed from $5,000,000 in 1939 to $20,000,000 in 1950.

Manufactures.—The manufactures, apart from the shipping of Saint John, are connected with lumbering and with agriculture. The making of pulp and paper, sawmill production and fish curing and packing were the three leading industries in the 1945–50 period, in that order of gross value of products. Co-operation in the manufacture of butter and cheese produced excellent results, and numerous cheese and butter factories are scattered through the province. To assist manufacturing, the provincial electric power commission undertook an expansion program, developing 141,000 h.p. by 1951.

New Brunswick in 1948 had 1,067 manufacturing establishments out of 33,447 in all Canada, with about 24,325 employees out of 1,156,006. Nearly half of these provincial workers were in the pulp and paper industry and in sawmills, about one-eighth in fish curing and packing and the same in vegetable processing. The rest were scattered, but many were in textile production and iron fabrication.

Communications.—The trunk lines of railway communications are the Canadian National Railways system (the former Intercolonial), the seashore route from Quebec province to Moncton, with an inland route via Edmundston, and the Canadian Pacific "short line" from Montreal, Que., to Saint John and Fredericton via the state of Maine. Trans-Canada Air Lines was established on a regular basis from Montreal to Moncton (Jan. 1, 1940), and six months later to Halifax, N.S. In 1948–49 direct T.C.A. operations commenced between Sydney, N.S., and Moncton. The Maritime Central Airways began flying on Dec. 8, 1941, with flights between Saint John and Charlottetown, P.E.I., via Moncton, and later branched into Nova Scotia and to the Magdalen Islands.

(S. LEA.; G. TR.; C. CY.)

NEW BRUNSWICK, a city of New Jersey, U.S., is the county seat of Middlesex county. It is on the Raritan river and federal highway 1, 30 mi. S.W. of New York city and 60 mi. N.E. of Philadelphia. It is served by the Pennsylvania and the Raritan River railways and by motorbus and motor freight lines. Pop., by federal census, (1950) 38,811; (1940) 33,180. The city rises from the river to high bluffs on the east and the west, commanding wide and picturesque views. It is the seat of Rutgers university, the state university of New Jersey, and New Brunswick Theological seminary, a school of the Reformed Church of America and the oldest theological school in the United States, founded in New York city in 1784 and situated in New Brunswick since 1810. New Brunswick is one of the oldest cities of New Jersey and has many buildings dating from the 18th century. The Buccleuch mansion, in a 60-ac. park, presented to the city by Anthony Dey, is one of the best preserved colonial houses in the state. In the city, and in the townships immediately surrounding, there are located many large industries manufacturing surgical supplies, pharmaceuticals, wire and cable, batteries, chemicals, needles, automobiles, paints, paper and leather products. New Brunswick's business district serves as a shopping centre for more than 150,000 people living within a radius of 10 mi. The assessed valuation in 1950 was $46,296,379. In 1906 the city adopted a commission form of government.

A settlement was established there in 1681. It was at first called Prigmore's Swamp, later Inian's Ferry, until the present name was adopted in honour of the House of Brunswick. A city charter was granted by the royal governor in 1730 and by the state legislature in 1784. Washington entered New Brunswick on Nov. 28, 1776, but evacuated it on the approach of the enemy, and from Dec. 3 to April 13, 1777, it was occupied by the British under Lord Howe.

NEWBURGH, a royal and small burgh, Fifeshire, Scot., on the Firth of Tay, 7 mi. N.W. of Ladybank junction by the North-Eastern Region railway system. Pop. (1951) 2,367. Its industries chiefly consist of the making of linen and oilskin goods, and there is a floorcloth factory. The trade in corn, fruit and potatoes, and the fisheries are important. About 1 mi. S.W. of the town stand the remains of Macduff's cross, which mark the spot where the clan Macduff was granted rights and sanctuary and composition for murder done in hot blood. Lindores abbey on the Tay is close to Newburgh. Of the Benedictine abbey, founded in 1178 by David, earl of Huntingdon, brother of William the Lion, there remain only the groined arch of the principal entrance, a portion of the west tower and other fragments. At Blackearnside, a forest of alders east of the village, Sir William Wallace defeated the earl of Pembroke in 1298.

NEWBURGH, a city of Orange county, N.Y., U.S., on the west bank of the Hudson river, opposite Beacon, 60 mi. N. of New York city. It is on federal highway 9W; is served by the Erie and the West Shore railways, motorbus and truck lines; and is connected by ferry with the New York Central at Beacon. The population of Newburgh in 1950 was 31,956; in 1940 it was 31,883 by the federal census. The Hudson widens at that point into Newburgh bay.

The city has two miles of water front, with a channel deep enough for ocean-going vessels. It occupies a commanding position on terraces rising abruptly from the river, and from the higher points the view embraces many miles of the Hudson and reaches to the Catskills on the northwest. Newburgh has a retail trade amounting to $49,000,000 annually; a large shipping trade in orchard, farm and dairy products; and a variety of manufacturing industries, with an output in 1949 valued at $95,000,000. In 1916 the city adopted a commission-manager form of government.

Newburgh was settled in 1709 by 53 Germans from the Rhenish Palatinate, led by their minister, Joshua Kockethal. Toward the middle of the century many of the Germans moved to Pennsylvania, and their lands were taken up by Scottish and English settlers, who in 1752 named the town after Newburgh, Scot., from which some of them had come. George Washington made his headquarters there from the spring of 1782 until Aug. 1783, in the Dutch farmhouse built by Jonathan Hasbrouck in 1750 (still standing in Washington park). There he wrote his letter of May 27, 1782, rebuking Col. Lewis Nicola for the suggestion that he assume the title of king; there he made his reply to the "Newburgh Addresses" calling for action by the army to force congress to redress its grievances; and there the arrangements were completed for demobilizing the continental army. Newburgh was incorporated as a village in 1800 and as a city in 1865.

NEWBURN, urban district, Northumberland, Eng., on the Tyne, 5½ mi. W. of Newcastle by a branch of the North-Eastern Region railway. Pop. (1951) 21,940. Area 7.3 sq.mi. It has collieries and iron, steel, engineering, tool and fire-clay works; and there is a large industrial population. Roman remains have been discovered near Hadrian's wall. The name of Scotswood, a manufacturing village between Newburn and the city, commemorates its occupation by the Scottish Covenanters in 1640. Newburn shared in the Tyneside depression of the 1930s, nearly 21% of the insured population being unemployed in June 1934.

NEWBURY, a municipal borough of Berkshire, Eng., 53 mi. W. by S. of Reading by the Western Region railway. Pop. (1951) 14,147. Area about 4 sq.mi. Newbury ("new town" or "borough") is first mentioned by Odericus Vitalis; it is probable, however, that the manor of Uluritone, entered in Domesday as held by Ernulph de Hesdain, covered a large part of the site. The manor subsequently passed to the crown and was held by Elizabeth before her accession. In 1627 it was granted by Charles I as a fee-farm to the corporation. Newbury was a borough by prescription; in 1187 its inhabitants were called "burgesses" and a document of the time of Edward I speaks of it as *burgus*. The borough was incorporated by a charter of Elizabeth (1596). It was extended in 1934. Newbury sent two representatives to the parliament of 1302.

The woollen industry declined early in the 17th century. The Weavers' company, which still exists, was incorporated in 1601. Newbury castle, of which traces remained until the 17th century, is said to have been besieged by Stephen in 1152. An important woollen market, established in 1862, is held annually.

Newbury is situated on the Kennet, which is followed by the Kennet and Avon canal. The church of St. Nicholas is an early 16th-century Perpendicular building. It is said to have been built mainly at the charge of John Winchcombe or Smalwoode (Jack of Newbury), an eminent clothier. A part of John Winchcombe's (Jack of Newbury's) house and the Jacobean cloth hall, now a public museum, still exist. The almshouses called King John's Court are supported by a foundation known as St. Bartholomew's Hospital, to which in 1215 King John granted by charter the profits of a fair on St. Bartholomew's day. Shaw house, on the outskirts, is an Elizabethan mansion; to the north is Donnington castle, retaining a Perpendicular gateway and other fragments. The suburb of Speenhamland was formerly an important posting station on the Bath road. At Sandleford priory, to the south of Newbury, the site and part of the buildings of an Augustinian priory (*c.* 1200) were utilized in the erection of a mansion in 1781. The householders of Newbury have the right to elect boys and girls to the educational foundation of Christ's hospital. Trade is agricultural and there are breweries and flour mills.

Battles of Newbury (1643 and 1644).—These two important battles during the English Civil War, more commonly called the Great Rebellion, are described under the latter heading. The first, on Sept. 20, 1643, arose out of the attempt of the royal army to bar the path of the parliamentary forces under the earl of Essex, which was returning to its base at Reading after raising the siege of Gloucester. Although Essex's army failed to break the royalist line, it had made so strong a moral and material impression that the royalists opened the road to it. The situation was reversed in the second battle, Oct. 26, 1644, when the parliamentary army had headed off Charles I on his way back to Oxford from Basingstoke. This was the first great manoeuvre battle of the war.

NEWBURYPORT, a city of northeastern Massachusetts, U.S., one of the county seats of Essex county, 38 mi. N.N.E. of Boston, on the southern bank of the Merrimack river, 3 mi. from the ocean. It is on federal highway 1 and is served by

the Boston and Maine railroad. Pop. (1950) 14,111; in 1940, 13,916 by federal census. It is an important manufacturing city with a diversified output, shoes, boots, radio and electrical parts. Shipping, distilling and jewellery making were established industries in the town at the close of the American Revolution. There are statues of George Washington and of William Lloyd Garrison (by J. Q. A. Ward and by David M. French, respectively) and many houses dating back to the 17th century, among them the stone "garrison" house in the form of a cross, with walls four feet thick. Other houses of interest are the birthplace of William Lloyd Garrison, the homes of "Lord" Timothy Dexter and Caleb Cushing and the Tracy mansion (1771), now part of the public library building. Indian Hill farm, birthplace of the journalist Ben Perley Poore, is 3 mi. W. of the city. The Putnam Free school, now part of the public-school system, was founded early in the 19th century by an endowment from Oliver Putnam. The high school for girls (opened in 1843) was a pioneer institution. Newbury, including the site of Newburyport, was settled in 1635 under the leadership of the Rev. Thomas Parker (1595–1677), who had lived in Newbury, Eng. In 1764 a tract of 647 ac. was set off and incorporated as the town of Newburyport, which (with enlarged boundaries) was chartered as a city in 1851. In the early part of the 19th century Newburyport was one of the most flourishing commercial centres of New England. Fishing, whaling and shipbuilding were the principal interests until the Civil War, and its clipper ships were among the fastest and the best known on the seas. During the Revolution and the War of 1812 it sent out many privateers.

NEW CALEDONIA: *see* Pacific Islands.

NEWCASTLE, DUKES OF. Within the space of a century there were no less than four successive creations of dukes of Newcastle in the British peerage. William Cavendish (*see* below), nephew of the 1st earl of Devonshire, was raised to the dignity of duke of Newcastle-upon-Tyne in 1665. His son and successor, Henry (1630–91), died leaving daughters only, and one of these married John Holles (1662–1711), earl of Clare, who was created duke in 1694. This duke died also without male issue, leaving his estates to his sister's son, Thomas Pelham (*see* below), who, with other dignities, had the title of duke of Newcastle-upon-Tyne conferred on him in 1715, and a second and similar ducal title (that of Newcastle-under-Lyme) in 1756. The first dukedom became extinct at his death, but the second title was granted him with remainder to Henry Fiennes Clinton, earl of Lincoln, at once his nephew and nephew-in-law. From that time the dukedom has remained in the Clinton family. The two principal dukes are more fully noticed below.

1. William Cavendish, duke of Newcastle (1592–1676), eldest surviving son of Sir Charles Cavendish and of Catherine, daughter of Cuthbert, Lord Ogle, and grandson of Sir William Cavendish and "Bess of Hardwick," was born in 1592 and educated at St. John's college, Cambridge. On the occasion of the creation of Prince Henry as prince of Wales in 1610 he was made a knight of the Bath, subsequently travelled with Sir Henry Wotton, then ambassador to the duke of Savoy, and on his return married his first wife, Elizabeth, daughter of William Basset of Blore, Staffordshire, and widow of Henry Howard, 3rd son of the earl of Suffolk. His fortune was immense, and he several times entertained James I and Charles I with great magnificence at Welbeck and Bolsover. In 1620 he was created Viscount Mansfield; in 1628, earl of Newcastle; and in 1629 the barony of Ogle was restored to his mother, this title, together with an estate of £3,000 per annum, descending to him. In 1638 he was made governor of the prince of Wales, and in 1639 a privy councillor. When the Scottish war broke out he assisted the king with a loan of £10,000 and a troop of volunteer horse, consisting of 120 knights and gentlemen. In 1641 he was implicated in the Army Plot, and in consequence withdrew for a time from the court. He was sent by Charles on Jan. 11, 1642, to seize Hull, but was refused admittance. When the king declared open war, Newcastle was given the command of the four northern counties, and had the power conferred on him of making knights. He maintained troops at his own expense, and having occupied Newcastle kept open communications with the queen, and dispatched to the king his foreign supplies. In Nov. 1642 he advanced into Yorkshire, raised the siege of York and compelled Lord Fairfax to retire after attacking him at Tadcaster. Subsequently his plans were checked by the latter's recapture of Leeds in Jan. 1643, and he retired to York. He escorted the queen, who returned from abroad in February, to York, and subsequently captured Wakefield, Rotherham and Sheffield, though failing at Leeds, but his successes were once more ravished from him by Fairfax. In June he advanced again, defeated the Fairfaxes at Adwalton Moor on June 30, and obtained possession of all Yorkshire except Hull and Wressel castle. He might now have joined the king against Essex, but continued his campaign in the north, advancing into Lincolnshire to attack the eastern association, and taking Gainsborough and Lincoln.

Thence he returned to besiege Hull, and in his absence the force which he had left in Lincolnshire was defeated at Winceby by Oliver Cromwell on Oct. 11, 1643, which caused the loss of the whole county. On Oct. 27, 1643 he was created a marquis. Next year his position was further threatened by the advance of the Scots. Against prevailing numbers he could do little but harass and cut off supplies. He retreated to York, where the three armies of the Scots, Fairfax and Manchester surrounded him. On July 1, Prince Rupert raised the siege, but on the next day threw away his success by engaging the three armies in battle, contrary to Newcastle's desire, at Marston Moor. After this disaster, notwithstanding the entreaties of the king and the remonstrances of Prince Rupert, Newcastle immediately announced his intention of abandoning the cause and of quitting England. He sailed from Scarborough accompanied by a considerable following, including his two sons and his brother, resided at Hamburg from July 1644 to Feb. 1645 and moved in April to Paris, where he lived for three years. There he married as his second wife Margaret (*see* below), daughter of Sir Thomas Lucas of St. John's, Colchester. He left in 1648 for Rotterdam with the intention of joining the prince of Wales in command of the revolted navy, and finally took up his abode at Antwerp, where he remained till the Restoration. In April 1650 he was appointed a member of Charles II's privy council, and in opposition to Edward Hyde, earl of Clarendon, advocated the agreement with the Scots. In Antwerp he established his famous riding school, exercised "the art of manage" and published his first work on horsemanship, *Méthode et invention nouvelle de dresser les chevaux* (1658; 2nd ed., 1747; translated as *A General System of Horsemanship*, 1743).

At the Restoration Newcastle returned to England, and succeeded in regaining the greater part of his estates, though burdened with debts, his wife estimating his total losses in the war at £941,303. He was reinstated in the offices he had filled under Charles I; was invested in 1661 with the Garter, which had been bestowed upon him in 1650; and was advanced to a dukedom on March 16, 1665. He retired, however, from public life and occupied himself with his estate and with his favourite pursuit of training horses. He established a racecourse near Welbeck, and published another work on horsemanship, *A New Method and Extraordinary Invention to Dress Horses and Work them According to Nature* . . . (1667). He wrote also several comedies, *The Country Captain and The Varietie* (1649), *The Humorous Lovers* and *The Triumphant Widow* (1677). With John Dryden's assistance he translated Molière's *L'Étourdi* as *Sir Martin Mar-All* (1688). He contributed scenes to his wife's plays, and poems of his composition are to be found among her works; and he was the patron of Ben Jonson, James Shirley, Sir William Davenant, Dryden, Thomas Shadwell and Richard Flecknoe, and of Thomas Hobbes, Pierre Gassendi and René Descartes. He died on Dec. 25, 1676, and was buried in Westminster abbey. By his first wife he had ten children, of whom one son, Henry, survived him, and became 2nd duke of Newcastle, dying in 1691 without male issue; the title then became extinct.

His second wife, Margaret, duchess of Newcastle (*c.* 1625–73), had been maid of honour to Henrietta Maria. The duchess cultivated literary composition with exuberant fervour, and kept a bevy of maids of honour obliged to be ready at all hours "to register her Grace's conceptions." Horace Walpole speaks of her as a "fertile pedant." She published, among others, *Philosophical Fancies* (1653); *Poems and Fancies* (1653); *The World's Olio* (1655); *Nature's Picture Drawn by Fancie's Pencil to the Life*, which includes an autobiography (1656); *Philosophical and Physical Opinions* (1655); *Orations of Divers Sorts* (1662); *Playes* (1662); *Sociable Letters* (1664); *Observations upon Experimental Philosophy* (1666); *Letters and Poems* (1676).

The Life of William Cavendish, Duke Marquis and Earl of Newcastle. . . , by Margaret, duchess of Newcastle, has been edited by C. H. Firth (1886); it was criticized by Samuel Pepys as "the ridiculous history of my Lord Newcastle writ by his wife, which shows her to be a mad, conceited, ridiculous woman, and he an ass to suffer her to write what she writes to him and of him," but on the other hand eulogized by Charles Lamb as a work for which "no casket is rich enough, no case sufficiently durable to honour and keep soft such a jewel." *See* also *La Duchesse et le Duc de Newcastle*, by Émile Montégut (1895). The duchess's *Select Poems* were edited by Brydges in 1813, and her *Autobiography* in 1814. The latter, edited by M. A. Lower, was published with her *Life of the Duke of Newcastle* in 1872.

2. Thomas Pelham Holles, duke of Newcastle (1693–1768), whose official life extended throughout the Whig supremacy of the 18th century, was the elder son of Thomas, first Lord Pelham, by his second wife, Lady Grace Holles, younger sister of John Holles, duke of Newcastle-on-Tyne, who died in 1711, and left the whole of his vast estates to him. In 1712 he also succeeded his father in his peerage and estates, and in 1714, when he came of age, was one of the greatest landowners in the kingdom. He vigorously sustained the Whig party at Queen Anne's death, and had much influence in making the Londoners accept King George. His services were too great to be neglected, and in 1714 he was created earl of Clare, and in 1715 duke of Newcastle-on-Tyne. He also became lord-lieutenant of the counties of

Middlesex and Nottingham and a knight of the Garter in 1718, in which year he increased his Whig connection by marrying Lady Henrietta Godolphin, granddaughter of the great duke of Marlborough. In 1717 he first held political office as lord chamberlain of the household, and in 1724 was chosen by Sir Robert Walpole to be secretary of state in place of Lord Carteret. This office he held continuously for 30 years (1724–54), and changed it only for the premiership on his brother's death. His long tenure of office was mainly because of his great Whig connections and his wealth, but praise must also be given to his inexhaustible activity and great powers of debate. He continued in office on Walpole's fall in 1742, and became more powerful on his younger brother Henry's becoming prime minister in 1743. On Henry Pelham's death in March 1754, Newcastle succeeded him as premier; but people who had been accustomed to him as secretary of state would not stand him as premier, and in Nov. 1756 he gave place to the duke of Devonshire. For his long services he was created duke of Newcastle-under-Lyme, with remainder to Henry Fiennes Clinton, 9th earl of Lincoln, who had married his niece Catherine Pelham. In July 1757 he again became prime minister—for William Pitt, though a great statesman, was a bad party leader—on the understanding, according to Horace Walpole, that "Mr. Pitt does everything, the duke gives everything." Under this ministry England became famous abroad, but it gradually fell before the young king's affection for Lord Bute, who, after supplanting Pitt, became prime minister in the room of Newcastle in May 1762. The duke went into strong opposition, and lost his two lord-lieutenancies for opposing the peace of 1763. In 1765 he became lord privy seal for a few months, but his health was fast giving way, and he died in Nov. 1768. The duke was not a great man, but he was industrious and energetic. He worked tirelessly, though vainly, to hold the Whig party together in the face of the determination of George III to destroy it. In this if in nothing else Newcastle was statesmanlike for it seems as though he alone clearly foresaw that calamity to the party which only union and organization could have averted.

See W. Coxe, *Memoirs of the Administration of the Right Hon. H. Pelham* (1829).

NEWCASTLE, a city and port of New South Wales, Australia, on the southern shore of the estuary of the Hunter river, where it enters the Pacific ocean, and 104 mi. by rail from Sydney. Pop. (1952 census) 137,590 including suburbs. The city is built at the foot of, and up, a steeply rising hill which backs the harbour, with a well-developed suburban area of 38 sq.mi. Its average annual temperature is 72°–55° F. and its average annual rainfall is 42 in With a large and fertile hinterland (Hunter valley, northern tablelands and Liverpool plains) and abundant coal resources at its doors, Newcastle was early a notable centre for the export of coal and primary produce. The possession of fuel, water, food supply and a good commercial position, and access to raw materials, have steadily attracted manufacturing industries and Newcastle has become one of the leading industrial areas in the southern hemisphere. Its iron and steel industries, established in 1915 by the Broken Hill Proprietary Company Limited (*q.v.*), have expanded to proportions rivalling its renowned coal trade. The black coal produced on the Newcastle-Cessnock field (9,343,900 tons for the year ended June 30, 1952) and iron and steel output (1,000,000 tons a year) represent 50% of Australia's total annual production. The establishment since 1950 of a large-scale rayon yarn and cord factory near Newcastle and the setting-up of cotton mills and a wool processing plant are indicative of textile manufacture becoming the city's third major industrial development. Newcastle's industries may be generally classified as metallurgical and metal-working; constructional engineering and shipbuilding; coke and chemical industries; textile manufacture; the making of fertilizer, cement, firebrick, pottery and woodworking. There are also flour and food product industries. These are conducted in Newcastle itself or in one of the numerous centres within easy reach of the port. The harbour (comprising North harbour, the Basin and Port Waratah) has ample accommodation, is well-sheltered and has modern installation for handling cargo and especially for loading coal and bulk wheat. The entrance is by a channel (500–450 yd. in width; average depth of 25½ ft. to a rock bottom) between breakwaters. Breaking of the rock bar across the entrance is projected to a depth of 32 ft. Its three miles of wharfage can be extended and it has a floating dock with a lifting capacity of 15,000 tons. Newcastle is the third port of Australia and the second of New South Wales in respect of trade which at mid-20th century normally amounted to £3,500,000 a year. Its exports (4,500,000 tons annually) are coal, coke, tar, etc.; frozen meat; butter, eggs; timber; pig iron, steel rails and plates, etc.; and fertilizers; and they usually exceed the imports (2,500,000 tons annually). About 6,000,000 tons of shipping, of which 2,000,000 tons are "overseas" vessels (*i.e.*, other than interstate or coastwise), use the port annually. Newcastle has railway and highway connections to the south with Sydney and to the rich dairy pastures of the north coast, and across the Hunter valley to the wheat, wool and cattle hinterland of the northwest. (W. Bs.)

NEWCASTLE, a seaside resort and urban district in County Down, Northern Ireland, on the west side of Dundrum bay, and 31 mi. S. of Belfast by road. Pop. (1951) 3,076. Area 2 sq.mi. Newcastle lies at the foot of Slieve Donard (2,796 ft.), the highest of the Mourne mountains. Electrical goods are manufactured. In the mountains is the Silent Valley reservoir, completed in 1933 for the supply of Belfast, with a capacity of 3,000,000,000 gal.

NEW CASTLE, a city of New Castle county, Del., U.S., at the head of Delaware bay, 6 mi. S. of Wilmington. It is on federal highway 40 and is served by the Pennsylvania railroad and steamship lines. Pop. (1950) 5,396. It has a good harbour, airports and manufacturing industries. New Castle played an important part in the territorial disputes of the Swedes, the Dutch and the English, from 1651, when Peter Stuyvesant built Ft. Casimir in the vicinity; and it was the capital of Delaware until 1777. The courthouse is one of the oldest public buildings in the U.S.; the Immanuel Protestant Episcopal church dates from 1689; and there are Dutch and English colonial dwellings still standing. The city was chartered in 1875.

NEW CASTLE, a city of eastern Indiana, U.S., 45 mi. N.E. of Indianapolis; county seat of Henry county. It is served by the New York Central, the Nickel Plate and the Pennsylvania railways. The population of New Castle in 1950 was 18,271; in 1940 it was 16,620 by the federal census. The city is the trade centre of a rich farming area, has important manufacturing industries (with an output in 1949 valued at $43,889,000), and is the seat of the Indiana Village for Epileptics. New Castle was founded in 1819 and incorporated in 1839.

NEW CASTLE, a city of western Pennsylvania, U.S., the county seat of Lawrence county; 50 mi. N.N.W. of Pittsburgh and 20 mi. S.E. of Youngstown, O., on the Shenango river and federal highways 224 and 422. It is served by the Baltimore and Ohio, the Erie, the Pennsylvania and the Pittsburgh and Lake Erie railroads. The population was 48,834 in 1950 and 47,638 in 1940 by the federal census. New Castle is an important commercial and industrial centre; its manufactures include steel, heavy rolling mill equipment, tin cans, glass, castings, chemicals and pottery. New Castle was founded in 1802. It was incorporated as a borough in 1869 and as a city in 1875.

NEWCASTLE-UNDER-LYME, a market town, municipal and parliamentary borough of Staffordshire, Eng., bounded on three sides by the city of Stoke-on-Trent. Pop. (1951) 70,028. Area 13.9 sq.mi. It takes its name from the "new castle" erected by the earl of Chester, the feudal overlord in the reign of Stephen, for the greater protection of his fief lying under what was during the Roman occupation the *Limes Britannica,* separating the provinces of Flavia Caesarensis, on the east, from Britannia Secunda, on the west. The castle served as a bastion during the long war against Wales. The fortification, being low-lying, became obsolete in Tudor times, and fell into decay. The town received its first royal charter of incorporation from Henry II in 1173, and the liberties and privileges were confirmed and extended by succeeding monarchs down to James II. In 1267 the borough and manor were granted by Henry III to his youngest son, Edmund Crouchback, and ever since then it has formed part of the duchy of Lancaster. The borough has sent representatives to parliament at least since 1354.

The parish church of St. Giles, the fourth or fifth on the same site, was rebuilt, with the exception of the tower, by Sir Gilbert Scott (1876). The University College of North Staffordshire was founded in 1949 and opened in 1950 at Keele hall, about 3 mi. west. In 1932 the borough was enlarged by the inclusion of Wolstanton (with a fine old church), Clayton and part of Keele. Chesterton (the site of a Roman camp), Knutton and Silverdale

also lie within the borough. The industries of Newcastle-under-Lyme are many and varied, and include collieries, brick and tile works, a cotton mill, a uniform-clothing factory and light engineering. (H. G. Ss.)

NEWCASTLE UPON TYNE, a city and county, parliamentary borough and port, standing on the River Tyne, England, 8 mi. from the mouth of the river and 272 mi. N. of London by road. Pop. (1951) 291,723. Area 17.3 sq.mi. It is the metropolis of the shipbuilding and industrial area of Tyneside.

One of England's principal railway stations, Newcastle is an important centre for rail communications with London, northwestern England and Scotland. Five principal bridges over the Tyne link Newcastle and Gateshead: the Tyne bridge (1928), taking traffic to the Great North road; the King Edward High Level bridge (1906), for the railway; the hydraulic swing bridge (1876), for foot passengers and vehicles; the Redheugh bridge (1900), for general traffic; and the old High Level bridge (1849) for the railway, road and foot passengers. The municipal airport was opened at Woolsington, 6 mi. N.W. of Newcastle, in 1935.

Municipal and commercial offices, the main shopping centre and principal places of entertainment in the city are concentrated in the square mile between the Tyne and the Town Moor. There broad, well-planned thoroughfares were introduced by Richard Grainger (1798–1861) and John Dobson (1787–1865) in place of the maze of narrow streets which had formed the old town centre. Grey street in particular is a superb example of town planning. Beyond lie pleasant, modern residential suburbs—Jesmond, the oldest, to the north, Walker, Walkergate and Heaton to the east, Denton, Fenham and Kenton to the west and northwest. There are 535 ac. of public parks in addition to the Town Moor (825 ac.).

History.—Newcastle was originally the site of a Roman station known as Pons Aelii. Its takes its name from the Norman castle, built in 1080 by Robert, eldest son of William the Conqueror and replaced between 1172 and 1177 by the impressive stone-built keep still standing today. Noteworthy features include the wellshaft, almost 100 ft. deep and surrounded by masonry 28 ft. thick at its broadest. The chapel is a fine example of late Norman architecture. In the Black gate adjoining the museum of the Society of Antiquaries houses the best-known collection of inscribed and sculptured stone illustrating the Roman occupation of Britain. The best remaining portion of the town walls lies between Westgate road and Gallowgate. A fragment of the Roman wall is visible on the south side of Denton bank. The guildhall, rebuilt in 1655–58, stands in the Sandhill.

The diocese of Newcastle, covering Northumberland, Berwick and small areas of Cumberland and Durham, was instituted in 1882. The church of St. Nicholas, adopted as the cathedral, is mainly 14th-century in date, though there is documentary evidence of a church on that site as early as 1123. The tower and steeple, added in the 15th century, are particularly beautiful examples of early Perpendicular. In particular the steeple is the finest known work in the style termed "Scottish Crown." The church of St. John the Baptist disputes with St. Andrew's the honour of being the city's oldest church though the building is mainly 14th and 15th century work. St. Andrew's is mainly 14th century but interesting earlier work remains, including the 12th century chevron-decorated chancel arch. This church was extensively damaged during the Civil War when Newcastle was twice occupied by the Scots and Charles I held prisoner by the army in 1646.

Administration.—Newcastle upon Tyne was a borough with its own written constitutions before the reign of Henry II. One of its most important charters was that of King John, granted in 1216, which authorized the burgesses to have a guild merchant. This association of traders, whose chief concern was to establish their monopoly of the town's trades, speedily assumed responsibility for town government. Thus, for example, the first reference to the office of mayor occurs in 1216. Henry IV by his charter of 1400 created Newcastle upon Tyne a county separate from and independent of the county of Northumberland. Accordingly it held its own court of quarter sessions, confirmed by William IV in 1836, and its own court of assize. Newcastle has been represented in parliament since 1283 when Edward I summoned two burgesses to his parliament at Shrewsbury. Since 1918 the parliamentary borough has been divided into four divisions of central, east, north and west, each returning one member of parliament. Since 1948 the constituency of West Newcastle has included Newburn urban district.

Education and Culture.—Of the independent schools in the city, the most famous are the royal grammar school, since 1907 occupying premises at Jesmond, which was founded by Thomas Horsley in the time of Henry VIII and incorporated by Queen Elizabeth I in 1600, and Dame Allan's school, since 1935 established at Fenham, which was endowed in 1705. The Municipal College of Commerce and Rutherford College of Technology provide both full and part-time further education. University education is provided by King's college which was founded in 1937 by the merging of Armstrong college and the University of Durham college of medicine. The former was founded in 1871 as a branch of the University of Durham and was the first university college to establish a department of mining. The latter, founded as the Newcastle School of Medicine and Surgery in 1834, was incorporated in Durham university in 1852.

The Municipal Museum of Science and Industry is devoted to the development and history of engineering, electrical engineering, mining, shipbuilding, transport and other industries with special reference to those of Tyneside; its exhibits include George Stephenson's locomotive. The Hancock Museum, named after the John Hancock collection of British birds, houses the collections of the Natural History Society of Northumberland, Durham and Newcastle upon Tyne, founded in 1892. Both water colours and oils by British artists are shown at the Laing art gallery; in particular there are water colours illustrating the development of the art in England from the 17th century onward. The public library has an extensive local history collection which includes local newspapers from the early 18th century onward, a fine series of works illustrated by Thomas Bewick, the wood engraver, family papers and other manuscripts. The Literary and Philosophical society, founded in 1793, also maintains a library, reading and lecture room.

Industry and Transport.—Coal, the basic element in industrial development, is Tyneside's most important natural resource. Mining began in the 13th century though coal exports were of little importance until the 17th century and industrial expansion proceeded slowly prior to 1800. Tyneside's achievements in shipbuilding are world-famous while its yards constitute one of the largest ship-repairing centres in the world. The Tyne itself has been navigated since Roman times. The conservancy of the river was originally vested in the corporation of Newcastle upon Tyne but in 1850 control passed to the Tyne Improvement commission. The commissioners accelerated development by undertaking large-scale dredging operations and providing improved docking facilities. The corporation owns the quayside at Newcastle almost 1½ mi. long which accommodates even the largest cargo ships. Exports include iron and steel products, coke and its by-products and chemicals. Tyneside is one of the principal wheat-importing centres in England and flour is milled locally. (E. M. Hw.)

NEWCHWANG, a Chinese port city in the province of Liaotung, Manchuria (40° 41′ N.; 122° 15′ E.), some 30 mi. above the mouth of the Liao river which enters the Gulf of Liao Tung. At the Treaty of Tientsin (1858), Newchwang was chosen as one of the ports to be opened to foreign trade, but it was Yingtze (or Yinkow) near the mouth of the Liao river which actually became the centre of foreign settlements and was opened to trade in 1864. In recent years there has been a tendency to designate the port correctly as Yinkow, but Newchwang remained the official name of the Treaty port. The town was in 1895 occupied by and later ceded to Japan, only to be retroceded to China under foreign pressure. During the Russo-Japanese War, it was first in Russian and later in Japanese hands, but was finally restored to China at the end of the war. The outlet of the Liao river is obstructed by a bar and the port is closed by ice for three or four winter months. It has railway connection with Peking and with the main Mukden-Dairen line of the South Manchuria railway by means of a short branch. Until 1907 Newchwang was the only treaty port of Manchuria and it shared in the rising prosperity of south Manchuria; but in more recent years its development has been checked owing to the remarkable rise of Dairen, though "prosperity" was returning with the new "Manchukuo" industrial development. With the Japanese occupation of Manchuria Newchwang was included in the puppet state of Manchukuo. The last full Chinese customs return for 1931 was St$5,919,428.

The chief imports were foreign cotton piece goods, cotton yarn, native cottons, aniline dyes; exports, mainly beans, bean oil, bean

cake, maize, cotton seed and coal. Until 1908 Newchwang was the centre of the bean oil and bean cake industry of Manchuria and of the export trade in these and other Manchurian products, but it has since been supplanted by Dairen. Before the outbreak of the war it was, however, the main Manchurian port for China trade, especially in bean cake for south China and bean oil for Shanghai. The main product of Newchwang is salt for industrial use (64% of all Manchuria). The reed of the neighbourhood is used for reed sacks (3,000,000 annually) and reed plants produce pulp material. Tashihchiao, 22 mi. east, is an important centre of magnesite mining. Cotton cloth weaving factories work for local consumption. Other products are hosiery, ribbons, towels, matches, soap, glass, knitting needles, bricks and dyes, etc. The sea fisheries of the neighbourhood are very important and employ about 3,000 fishermen and 550 boats, the annual yield of fishery products being worth more than 500,000 yen. The population in June 1938 was 159,470, of which 5,612 were Japanese, 1,611 Koreans, the remainder being Chinese; 1940 census, 180,871.

NEWCOMB, SIMON (1835–1909), American astronomer, was born in Wallace, Nova Scotia, on March 12, 1835. He became a resident of the United States in 1853, and graduated at the Lawrence scientific school of Harvard university in 1858. He was an assistant in the American *Nautical Almanac* office 1857–61. In 1861 he became professor of mathematics in the United States navy, and was assigned to duty at the United States Naval Observatory. For more than ten years he worked with the various meridian instruments, and when the 26in. equatorial was erected in 1873 he was put in charge of that instrument. In 1877 he was assigned to duty in charge of the American *Nautical Almanac* office, a post which he held until March 1897. In 1884 he became professor of mathematics and astronomy at the Johns Hopkins university, continuing, however, to reside at Washington. He was also editor of the *American Journal of Mathematics* for many years. In view of the wide extent and importance of his labours, the variety of subjects of which he treats, and the unity of purpose which guided him throughout, Simon Newcomb must be considered one of the most distinguished astronomers of his time. A study of his works reveals an unusual combination of skill and originality in the mathematical treatment of many of the most difficult problems of astronomy, an unfailing patience and sagacity in dealing with immense masses of numerical results, and a talent for observation of the highest order. On taking charge of the *Nautical Almanac* office, he became very strongly impressed with the diversity existing in the values of the elements and constants of astronomy adopted by different astronomers, and the injurious effect which it exercised on the precision and symmetry of much astronomical work. Accordingly he resolved to "devote all the force which he could spare to the work of deriving improved values of the fundamental elements and embodying them in new tables of the celestial motions." The formation of the tables of a planet has been described by Cayley as "the culminating achievement of astronomy," but the gigantic task which Newcomb laid out for himself, and which he carried on for more than 20 years, was the building up, on an absolutely homogeneous basis, of the theory and tables of the whole planetary system. The results of these investigations have, for the most part, appeared in the *Astronomical Papers of the American Ephemeris,* and have been more or less completely adopted for use in the nautical almanacs of all countries. A valuable summary of a considerable part of this work was published in 1895, as *The Elements of the Four Inner Planets and the Fundamental Constants of Astronomy.* In 1866 Newcomb had published an important memoir on the orbit of Neptune, which was followed in 1873 by a similar investigation of the orbit of Uranus (*Smithsonian Contributions to Knowledge,* vols. xv. and xix.). About 25 years later new tables of these planets were issued by him (*Astronomical Papers of the American Ephemeris,* vol. vii., pts. 3 and 4) based on unpublished investigations in which the elements were determined from the best available observations up to that time. In the meantime the theory of Jupiter and Saturn had been thoroughly worked out by G. W. Hill, Newcomb's distinguished collaborator in the *Nautical Almanac* office, and thus was completed one important section of the work projected by Newcomb in 1877.

NOTABLE ACHIEVEMENTS

Among Newcomb's most notable achievements are his researches in connection with the theory of the moon's motion. His first work on this abstruse subject, entitled *Théorie des perturbations de la lune, qui sont dues á l'action des planètes,* is remarkable for the boldness of its conception, and constitutes an important addition to celestial dynamics. For some years after the publication of Hansen's tables of the moon in 1857 it was generally believed that the theory of that body was at last complete, and that its motion could be predicted as accurately as that of the other heavenly bodies. Newcomb showed that this belief was unfounded, and that as a matter of fact the moon was falling rapidly behind the tabular positions. With the view of examining this question, he undertook the reduction of every observation made before 1750 which appeared to be worthy of confidence. The results of this work were published in 1878. The discussion of the observations made after 1750 was interrupted by his work on the planetary tables carried on during his connection with the *Nautical Almanac* office. After his retirement from active service in the navy he was enabled, due to a grant from the Carnegie Institution of Washington, to secure the necessary assistance from 1903 to 1909 to bring to completion the work of his great programme on the motion of the moon. This was finished less than a month before his death. The observations used in his work covered an extreme range in time of about 2,600 years and seemed, as he himself said, "to prove beyond serious doubt the actuality of the large unexplained fluctuations in the moon's mean motion."

On taking charge of the 26in. equatorial at the United States Naval Observatory, Newcomb devoted it almost exclusively for the first two years to observations of the satellites of Uranus and Neptune. The results of these skilfully conducted observations were published in a memoir on *The Uranian and Neptunian Systems.*

As early as 1860 Newcomb communicated an important memoir to the American Academy, *On the Secular Variations and Mutual Relation of the Orbits of the Asteroids,* in which he discussed the two principal hypotheses to account for the origin of these bodies—one, that they are the shattered fragments of a single planet (Olbers's hypothesis), the other, that they have been formed by the breaking up of a revolving ring of nebulous matter.

In the *Astronomical Papers of the American Ephemeris* will be found a large number of contributions from Newcomb's pen on some fundamental and most important questions of astronomy. Among these are papers on *The Recurrence of Solar Eclipses, A Transformation of Hansen's Lunar Theory, Development of the Perturbative Function and its Derivatives.* His memoir *On the Motion of Hyperion, a New Case in Celestial Mechanics,* is in some respects one of his most original researches. He discussed the transits of Venus of 1761 and 1769, and those of Mercury from 1677 to 1881. At the international conference, which met at Paris in 1896 for the purpose of elaborating a common system of constants and fundamental stars to be employed in the various national ephemerides, Newcomb took a leading part, and at its suggestion undertook the task of determining a definite value of the constant of precession, and of compiling a new catalogue of standard stars. The results of these investigations were published in 1899, and were in general use for a quarter of a century. In the intervals of these immense labours, on which his reputation as an astronomer rests, he found leisure for works of a lighter character; *e.g.,* his *Popular Astronomy* (1878), his *Astronomy for Schools and Colleges* (1880), written in conjunction with E. S. Holden, and *Astronomy for Everybody* (1903). After his retirement from official life he published an excellent popular treatise on *The Stars* (1901). Several of these books have been translated into one or more of seven different foreign languages. A more recondite work is his *Compendium of Spherical Astronomy* (1906). He also wrote on questions of finance and economics, as well as in the field of fiction.

He received honorary degrees from ten European and seven American universities. He was a member of 45 foreign societies. He was awarded the gold medal of the Royal Astronomical society in 1874, the Huyghens gold medal of the Holland Society of Science in 1878, the Copley medal of the Royal society in 1890, the Bruce gold medal of the Astronomical Society of the Pacific in 1897, the Schubert prize of the Imperial Academy of Sciences, St. Petersburg, in 1897, and the Sylvester prize of Johns Hopkins university in 1901. He died at Washington on July 11, 1909, and was given a military funeral befitting his rank as a rear admiral in the United States navy.

An autobiography, *Reminiscences of an Astronomer,* appeared in 1903; and a bibliography of his life and works containing 541 titles is given by R. C. Archibald in *Memoirs of the National Academy of Sciences,* xvii, "First Memoir," pp. 19–69. This also contains, pp. 1–18, "Biographical Memoir" by W. W. Campbell. (W. S. E.)

NEWCOMEN, THOMAS (1663–1729), English engineer, one of the inventors of the steam engine, was born at Dartmouth. While employed as ironmonger in his native town, he corresponded with Robert Hooke about the possibility of obtaining motive power by exhausting the air from a cylinder provided with a piston, Denis Papin and the marquis of Worcester having already made investigations on this subject. In 1698 he entered into partnership with Thomas Savery (*c.* 1650–1715), who had patented a method for raising water from mines. Newcomen's improvements on Savery's invention were so successful that they produced together a pumping-engine which served as a model for nearly three-quarters of a century. For a description of the "atmospheric steam-engine," then known as a "fire-engine," which they constructed in 1705, *see* STEAM ENGINE. John Cawley (or Calley) was also associated with them in this invention. Newcomen died in 1729, probably in London.

NEWDIGATE, SIR ROGER (1719–1806), English antiquary, was born on May 30, 1719. He was the 5th baronet of Harefield (in Middlesex) and Arbury (in Warwickshire), and grandson of Sir Richard Newdigate, an English chief justice during the time of Richard Cromwell's protectorate. He had an active political career, but is chiefly remembered for his collection of antiquities including marbles, casts of statues and vases. Two marble candelabra found in Hadrian's villa at Rome he purchased for £1,800 and presented them to the Radcliffe library at Oxford. Among his other generosities to the university were a chimney piece, for the hall of University college, and the sum of £2,000 for the removal by Flaxman of the Arundel collection of marbles to the Radcliffe library. The "Newdigate" prize of 21 guineas for English verse, which is open for competition each year to the undergraduates of Oxford university, was founded by him and was first awarded in the year of his death. He died at Arbury on Nov. 23, 1806.

NEWEL, in architecture, originally the central shaft around which a spiral or semi-circular staircase winds. Now more commonly any post at the intersection of a stair with a landing, in which case it is a vertical post which receives the rail and is framed into the supporting strings or beams of the stair construction. By extension, the term is also applied to any post in the railing larger than the other posts or balusters.

NEW ENGLAND. That portion of the eastern coast of North America lying between the 41st and 45th degrees of north latitude received its name of New England in 1614 from Capt. John Smith, who explored those shores on behalf of the Virginia company of English merchants.

Physiographically, New England possesses great variety and also a unity derived from isolation. Such physical isolation and unity is, however, deceptive, for New England faces on three fronts. The long and deeply indented coast line from its easternmost point on the Bay of Fundy to the tip of Cape Cod turns New England toward the maritime provinces of Canada, toward the fishing grounds of the Newfoundland banks and toward the ports of northern Europe, from which it is some hundreds of miles less distant than are its rival ports in the middle states. New England's southern shore from Cape Cod to the Hudson river invites close relations with the states to the south, that part lying west of the Connecticut river especially falling within the area of the metropolitan influence of New York rather than any New England centre. The northwestern region, on the other hand, turns its back on the rest of New England and finds its outside connection through Lake Champlain and the Richelieu river or through Lake Memphramagog with the Canadian province of Quebec.

Although parts of the coast of New England had been known to European fishermen early in the 16th century and it is certain that outlying islands and capes were visited frequently after 1560, no permanent settlement was achieved until the next century. That New England remained open so long after its exploration as a refuge for minority groups seeking homes rather than adventure was due to the fact that its inhospitable climate, stubborn soil and lack of profitable natural products did not invite capitalistic exploitation. That the early settlements of Pilgrims and Puritans remained undisturbed was due to the fact that this area was not a gateway to the interior; its rivers afforded access to no regions where settlers or capital were needed.

Surprising freedom from Indian opposition during the critical first decades of settlement is explained by the decimation of the native population by plague in the years 1610–20. By the time the Indians rallied for a concerted attempt (called King Philip's War) to expel the white intruders, the colonists were barely able to survive the attack. In that struggle the systematic land allotments and close village social structure clearly vindicated itself as a military advantage. On the social side also it proved its worth in affording opportunity for early district elementary schools, a college (Harvard, 1636) and, in the larger settlements, a few of the amenities of an urban civilization.

While substantial financial resources assured the success of the Puritan colony of the Massachusetts Bay company, the survival of the feeble and ill-supported settlement of the Pilgrims at Plymouth proved that a living could be won from the wilderness by extraordinary effort and self-discipline. Both examples prompted other undertakings. Roger Williams and Ann Hutchinson, refugees from the theocracy of Boston, with no backing from the home government, made tiny settlements on Narragansett bay south of the jurisdiction of the Massachusetts Bay colony, and secured recognition as a separate colony of Rhode Island with a charter from the crown. On the other hand, new immigrant groups enlarged by malcontents from Massachusetts established strong settlements on the southern coast and secured royal recognition as the colony of Connecticut in 1661. In four directions colonial attempts of a distinctly different type were attempted. Based on Champlain's discovery in 1609 of the lake which bears his name, the French government in Canada attempted to establish *seigneuries* on the slopes of the Green mountains bordering that lake. On the coast of Maine, Sieur de Monts in 1604 and a band of Jesuits in 1613 tried to found colonies. North of the Merrimac river Capt. John Mason received a grant from the crown and sent settlers to the mouth of the Piscataqua (Portsmouth). His plans for an aristocratic domain modelled on the mediaeval County Palatine as well as his appointment as royal governor-general of all New England came to naught with his death in 1637. His settlers fell under the rule of the Massachusetts Bay company until created into a royal province in 1679. Farther northeast another royal proprietor, Gorges, planned to colonize but failed in competition with the Puritan settlers. His heirs sold their claims to Massachusetts in 1674 and the region under the name of the District of Maine remained a part of Massachusetts until erected into an independent state in 1820.

The New England colonies had attracted little attention from the restored Stuarts until complaints of the independent attitude of the Massachusetts authorities in the persecution and exclusion of Quakers and Anglicans and a disregard of the Navigation acts drew down the royal displeasure. James II attempted to systematize his northern colonies by consolidating all the New England colonies with New York and New Jersey under a single royal governor. From an administrative point of view the scheme was sound. This new "Dominion of New England" would also have

enabled the English to oppose the threatened aggressions of the French more effectively, but the methods of James's agent, Randolph, and his governor, Andros, roused bitter opposition in New England. The cancellation of their charters the colonists regarded as a destruction of their constitutional rights. When the news of the glorious revolution in England reached Boston, Andros was overthrown, Connecticut and Rhode Island quietly resumed their old charter governments and Massachusetts obtained at the court of the new sovereigns, William and Mary, a restoration of many of her old rights under a new "province" charter (1691). By 1800 every acre of the land in the three southern New England states had been parcelled out in townships, and the frontier of almost contiguous settled communities pushed up to the 45th parallel—viz., a line from Vergennes on Lake Champlain to Bangor on the Penobscot. The qualities and characteristics which have distinguished the New Englanders and the institutions which New England has given to America were developed in the colonial period. At first, the most pronounced characteristic was the capacity for co-operative action. From this sprang the public school system, the town government, the Congregational Church organization. By the Revolution, however, the individualism which appeared sporadically in the early years came to be general and reached its height in Jonathan Mayhew, William Bentley, the Adamses, Thoreau and Emerson and in the educational theories of Charles William Eliot. Much has been said of the spiritual heritage of the Puritans and Pilgrims, and ideals with which they came to New England; but economic conditions may explain many peculiar features of New England life. Unquestionably the New England colonists suffered from lack of division of labour. The nature of the soil, the lack of easily accessible markets, the difficulty of securing a surplus of any great staple to exchange for other necessities forced each family to provide for its own wants. This produced a people of singular ingenuity and resourcefulness but without specialized skills. It offered no premium for systematic development of agriculture or industries except the few in which New England had a natural advantage both in production and in marketing. Of these the greatest was shipbuilding. This industry began almost at once with Winthrop's "Blessing of the Bay" launched on the Mystic river in 1631. On nearly every navigable stream in close proximity to the supply of timber arose small shipyards where the neighbouring farmers, trappers or fishermen employed their time in off-seasons in turning out vessels. For these they found a ready sale, because the English Navigation acts admitted colonial-built vessels to the status of English ships in the monopoly of the carrying trade of the expanding empire.

To the mother country New England seemed, until well into the 18th century, one of the least valuable of her overseas possessions. The area had not lived up to the expectations of the statesmen and merchant-capitalists who had encouraged its settlement, even as a source of ship-timber and furs. As a market for English products New England's slow growth of population, after the initial Puritan exodus, was disappointing. Its self-sufficiency contrasted markedly with the constant reliance placed by other settlements upon the board of trade for financial aid and political direction. As a result New England was ruled under a policy of "salutary neglect." The leadership of New England in American colonial resistance to the Acts of Parliament from 1763 to 1774 was due largely to three factors—first, the fact that the natural course of New England economy contravened the principles of mercantilism on which British imperial policy was based. Second, the attempt to enforce the application of those principles in the Sugar act and other acts of trade had precipitated a serious reaction from the prosperity which New England had enjoyed during the French Wars from 1689 to 1763. Just at that time, by the Stamp act, Grenville attempted to force the colonies to pay some portion of the cost of maintaining the newly won empire. Finally, New England town meetings afforded a unique sounding board for such men as Samuel Adams; and her colonial assemblies, accustomed to represent the mercantile element against the royal governors, gave a pseudoconstitutional appearance to action for intercolonial "congresses" to bring pressure by boycotting British goods.

New England played her chief part in the Revolution during the years 1765–77 in defining the issues and in precipitating actual hostilities. Though these centred in Boston, sentiment for and against rebellion and independence was fairly evenly distributed throughout New England, the line of cleavage being one of class and occupation rather than of locality. After the British evacuated Boston on March 17, 1776, New England saw little of active hostilities, except for the part played by her militia in checking Burgoyne's advance at Bennington, Vt., and in the struggles over the possession of Newport, R.I. Her irreconcilable temper convinced the British that attempts at conciliation or subjugation had greater chance of success elsewhere. The revolt against the mother country brought less of the civil war between rebels and Tories in New England than occurred farther south, chiefly because the Tory oligarchy had a very narrow basis in New England, was early overthrown and retired with the Red Coats to exile in Nova Scotia, New Brunswick and the West Indies. Control of the new state governments which were almost immediately formed fell into the hands of conservative elements who assumed the political offices and social leadership vacated by the fugitive loyalists.

The period of disorganization which followed the cessation of hostilities brought great suffering to many communities and certain classes in New England. The utter disruption of the old courses of commerce within the British empire no longer supplemented by privateering and wartime trade with other countries caused a lack of specie. Every state fell a prey to a greater or less degree to the paper money craze. Rhode Island, in particular, suffered so heavily that civil war threatened. The refusal of the Massachusetts legislature to relieve the pressure of debts and taxes by stay laws and further issues of paper money led to a rebellion under the leadership of Daniel Shays. Although New England leaders played prominent parts in the federal convention, the actual ratification of the new constitution proved a difficult matter in Massachusetts and New Hampshire and was rejected in Rhode Island until 1790. Such sentiment as turned New England toward the creation of "a more perfect union" came mainly from the creditor and mercantile classes and sections; chiefly it was due to the hope for a stable national currency and credit and for a national tariff system which could be used as a lever to pry from reluctant European governments the opening of their home and colonial posts to American trade.

For nearly a decade after the inauguration of the new government under Washington the superior organization of the dominant commercial interests committed New England as a whole to the Federalist party, but Jefferson gradually organized the latent anti-Federalist and Democratic elements until in the election of 1800 he was able to carry several representative districts.

The basis of New England's prosperity in the Federalist period seems to lie in the application of Yankee energy and resourcefulness to the exploitation of the peculiar advantages of New England in foreign trade. Her ships, restricted in their enterprises in the older fields under control of the British crown, turned to the Mediterranean and to the Pacific and Indian oceans. In 1786 Samuel Shaw established in Canton the first American mercantile house in China. In 1787 the "Grand Turk" brought to Salem the first of the many oriental cargoes which made that port famous. In 1792 Capt. Robert Gray's "Columbia" carried the Stars and Stripes around the world for the first time and laid the foundations not only for the American claim to Oregon but also the very profitable trade with the northwest coast, where furs were obtained which could be exchanged in China for silks and tea. Salem became for a time the tea market of America and Europe and the third city in the union. The heyday of New England's mercantile success was shared to a considerable extent by all classes. There was speculation in timberlands and a rapid shift of population into the frontier states—Maine, New Hampshire, Vermont, western New York and Ohio. The Napoleonic wars altered this picture. Although equipped to compensate the loss inflicted on her commerce by English and French wartime restriction through the enormous profits made in privateering and in block-

ade running, the New England shipper could not survive the devastating effect of the Republican embargo policy. The war of 1812 was regarded in New England as James Madison's war, forced upon him by the "warhawks" of the west, and was viewed as another and convincing demonstration that the annexation of Louisiana and the development of the western states was ruinous to the interests of the old commercial states of the northeast and justified that group in seceding from a union in which they would clearly form a hopeless minority. Convinced of the injustice done to their section, New Englanders disregarded the embargoes, carried on illicit trade with the English in Canada and West Indian ports, discouraged recruiting and subscriptions to war loans and refused to celebrate victories gained by the French over the common enemy, the British.

In three respects only did New England enter the war. It supplied men and ships to the navy, was especially active in fitting out privateers and tried in vain to prevent by its own militia the occupation by the British of its seaboard east of the Kennebec river and the harassment of its coastal waters by British frigates. A threatened secession movement in 1804 had been headed off by the wiser Federalist leaders like George Cabot and Alexander Hamilton, but by 1814 the sentiment had got beyond the control of the moderates and resulted in the convention at Hartford, Conn., which demanded an amendment of the constitution to protect New England interests. The termination of the war left this movement high and dry; it brought its sponsors—the Federalist party and New England generally—into disrepute among the nationalistically minded rising generation of statesmen from the south and west. The interference with its commerce wrought by the embargo together with the interruption of the usual flow of manufactured merchandise from England and the continent caused some New England capitalists to transfer their money from shipping to the new textile plants which had been introduced during the last decade of the 18th century. At Beverly and Waltham in Massachusetts, at Pawtucket and Woonsocket in Rhode Island, the new spinning and weaving machines had been set up. Saved by the war from immediate competition with English textiles, these factories gained a start. The termination of the war saw a great importation of English goods. Faced with ruin, the millowners of New England joined with the infant woollen manufacturers of Pennsylvania to secure a protective tariff in 1816. As part of a general burst of nationalism the policy of protection and creation of a home market as advocated in Hamilton's famous report on manufactures was adopted. Increased rates were sought after the depression of 1819 and by 1824 New England politicians of all parties were faced with a new sectional issue. Manufacturing as a New England occupation grew steadily through the next generation, bringing with it the social, economic and political problems of concentration of population and constant demand for cheap labour and widening markets. In the same period, 1816–50, the rapid expansion of the agricultural regions of the south and west brought into the eastern markets the cheaper cotton as well as the cheaper foodstuffs. The former stimulated more textile activity—the latter drove the less well-situated farmers to abandon their farms and migrate to the west.

Several of the shibboleths, such as "Manifest Destiny," which swept the national government in the first half of the 19th century, left New England cold. Its own northern and eastern regions of New Hampshire, Vermont and Maine were losing their frontier character. The northern boundary, long subject to dispute even to the extent of an armed clash known as the Aroostook War of 1838, was finally determined by the Webster-Ashburton treaty in 1842. While hostile to western expansion, and to the policy of cheap public lands which went with it, New England had contributed mightily to people the new areas. Lois K. Mathews' *Expansion of New England* admirably relates the direction, quantity and peculiar quality of the migration from the New England states. Through this transplantation of population to the new states of the old northwest and later to Iowa, Kansas and Oregon, New England continued to exert the peculiar influence of its Puritan traditions. In the great problem which confronted the inhabitants of the areas of the Mississippi valley and the western plains—transportation—New England took little interest until railroad building came into the class of capitalistic enterprises. Its location excluded it from the competition in canal, highway and railroad building for access to the west, and the port of Boston fell behind its rivals. Yet New England had locally been a pioneer in railroad experimentation. One of the first railroads in the U.S. was built in 1826 to carry granite blocks from the Quincy quarries to tidewater. In the '40s, short lines were built connecting Boston with Providence, Lowell, Portsmouth, Worcester, Springfield, New Haven and New York. In 1850 Massachusetts ranked third to New York and Pennsylvania in railroad mileage.

The humanitarian movements of the '30s produced lively response in New England. Not only were the social problems incident to concentration of population in its mill towns provocative of controversy over questions such as the length of a working day and conditions of labour, the right to strike and the association of workers, but the assembling of people within easy reach of such potent agencies for education and enlightenment as schools, colleges and lyceum lectures had a stimulating effect on the popular interest in all sorts of questions. In this soil flourished many new ideas—advocates of liberal movements in religion, like William Ellery Channing, Theodore Parker and Horace Bushnell, crusaders for temperance like Neal Dow, who in Maine secured the first prohibition law in the United States, or for abolition of slavery like William Lloyd Garrison, for public high schools like Horace Mann; the Concord group—Ralph Waldo Emerson, Henry D. Thoreau and Bronson Alcott—gave New England an international reputation for "transcendental philosophy"—and with Henry Wadsworth Longfellow, Oliver Wendell Holmes and James Russell Lowell made this section the literary centre of America. The colleges and the academies that had survived the Revolution largely as sectarian institutions or theological schools now took on more liberal aims and methods and sent their graduates all over the country. At Litchfield, Conn., the first real law school in the U.S. flourished, under the guidance of Chancellor Kent, and produced such men as John C. Calhoun. Harvard college, where the triumph of liberalism over the more orthodox Puritan party in Boston in the early 18th century had led to the founding of Yale by conservatives, carried its liberalism still farther and in mid-19th century, borrowing its educational methods largely from Germany, gradually widened its curriculum on an elective basis and developed graduate schools of law, medicine, arts and science. In Providence the Baptists had founded Brown; at Middletown, Conn., the Methodists established Wesleyan; in the Connecticut valley arose Amherst; in the Berkshires Williams college; and in Maine appeared Bowdoin, Bates and Colby. In Vermont a state university was established through the benevolence of Ira Allen.

The position of New England in the Civil War accords with the double character of that struggle—the abolition of slavery and the preservation of the union. The same men who gave their lives for the latter issue had heaped abuse upon the men like Garrison who had agitated for 20 years in favour of the former issue. On the other hand, Wendell Phillips had denounced the clergy and the Cotton Whigs for their willingness to compromise with the slaveowners, and a great convention at Worcester advocated New England's secession from a union which required its members to enforce the Fugitive Slave law and to recognize slaveholders' property rights in human flesh. Once war began, New Englanders supported the administration steadfastly although the persistent demands of Charles Sumner and other abolitionists for immediate emancipation frequently caused embarrassment to Pres. Abraham Lincoln. During the Reconstruction period New England remained consistently Republican in spite of a liberal wing led by Charles Francis Adams.

New England commerce suffered severely during the Civil War. The whaling fleet, once the pride of New Bedford and Nantucket, was broken up by Confederate raiders, and its monopoly of the illuminating oil market was destroyed by introduction of kerosene oil and gas. By the change from wooden to iron and then to steel ships, and by the rising costs of operation under the U.S.

flag, all the natural advantages in the construction and operation of ships which New England formerly possessed were lost.

Again as in 1812 New England's answer was to shift its capital from shipping to manufacturing. Again as in the 1830s and '40s it succeeded, but toward the close of the century was faced with competition from new centres in the south and west, equally well-equipped with power sites, with capital and within easier reach of the source of raw materials and of the markets.

The electrical age developed early in New England. From a small local plant in Lynn, Mass., the Thompson Houston company developed in two decades into the General Electric company, extending its chain of factories across the continent. The Bell Telephone company, initiated by Boston capital and engineers, had a similar history. Again New England capital and engineering skill led by the Boston firm of Stone & Webster spread electric trolley lines into nearly every state in the union and led in the development of hydroelectric power. Vulcanized rubber process was another New England specialty which saw its greatest application in the midwest. Probably New England's greatest contribution to the typically modern American facility in mass production stemmed from the late 18th century, when the idea of replaceable parts, specialized part manufacture and assembly sprang from Connecticut clockmakers and was applied successively to firearms, sewing machines, typewriters, agricultural implements, machine tools and automotive machinery. The names of Pratt and Whitney are associated with much of this development.

The necessity of self-sufficient communities in colonial days produced the "jack-of-all-trades" quality in the Yankee which made him especially efficient in the early stages of industrial development, when resourcefulness in adaptation of materials and ingenuity in their use were required. As manufacturing processes became standardized and semiautomatic machines were evolved, the bulk of the work could be done by the semiskilled or even unskilled labour supplied by the great waves of immigration of the late 19th century. The population of New England by the 1940s reflected this change, but the persistent value of the Yankee all-round mechanic is seen in the preference shown for New England by industries requiring a high percentage of value added by labour to the total cost of the product.

Throughout the national period New England not only supplied most of its own capital but was most of the time a chief exporter of capital to other sections—western land mortgages, steam and electric railways, mining, stockyards, hydroelectric developments. Typical of the enterprises thus financed in the early 20th century were the Chicago, Burlington & Quincy railroad and the Calumet and Hecla mines.

The distribution of foreign-born or native-born of foreign parentage followed roughly the diffusion of industry from the coastal cities to inland towns. In some rural areas the immigrant largely replaced native farming stocks. In the old Puritan town of Salem in 1940, at least one-third of the population was of recent French-Canadian origin. Most of the chief textile and metal manufacturing centres began to depend in the 20th century on immigrant labour of non-English-speaking stock. In neither the boom years nor the depression years between 1914 and 1941 did New England prosper or suffer so much as most sections of the U.S. This is explained by the diversity of New England's investment of capital, the variety and generally limited size of the industrial units, the high percentage of skilled labour capable, with the plant, of conversion from one product to another. A further factor making for stability was the conservatism of New England banking, the large percentage of savings bank accounts and insurance policy holders and the persistence of a considerable fraction of the population on small, partly self-sufficient farms.

The fisheries, earliest of New England's enterprises, survived periodic depressions and revolutionary changes in techniques. Although by 1920 largely mechanized and dependent on refrigeration, it still retained elasticity in personnel, equipment and methods enabling it to support a considerable part of the sea coast population, although only a minority remained of the older native stocks. After 1880 the water power upon which colonial and early 19th-century milling and manufacturing had depended gave way to steam-coal power plants. After 1915 hydroelectric lines brought power to a large part of the section, but did not displace oil or coal steam generated plants near the coast.

Apart from the decline in its relative position in commerce, the chief respect in which New England altered in comparison with other sections of the union was in the character of its population. From being the most homogeneous section of the original states, New England became one of the most cosmopolitan areas. The first development of industries on a factory basis was effected by drawing the native New England stock from farms to factories without reliance on the recent immigrants. It was not till after 1840 that the number of non-English immigrants began seriously to affect its political or social structure. The great immigration of Irish after the famine in 1846 produced some serious disturbances in the many industrial towns, and New England shared the anti-foreign sentiment which took political shape in the Know-Nothing party. The immigration of large groups of non-Protestant southern and eastern Europeans between 1890 and 1914 altered the situation rapidly. Although the number of native-born of English ancestry even then formed a minority in New England as a whole, and was almost negligible in the industrial centres, the blocs of foreign-born or those of non-English ancestry tended largely to offset each other for political and social or economic purposes. Of these "foreigners" the Irish took the most active part in politics. Except for a short period in 1912 during strikes in the textile centres, the influence of radical leaders was slight among the working classes. Trade unionism existing in most industries was generally directed in conformity with the conservative policy of the American Federation of Labor. That there was no general attack on the principles of capitalism was due in part to the fact that the New England states were leaders in legislation favourable to labour as respects conditions and hours of work, and in part to the conservative attitude of the Catholic Church on this issue and, to a less ascertainable degree, to the high proportion of small capitalistic enterprises employing highly skilled labour.

(P. P. C.)

NEW ENGLAND PRIMER, "The Little Bible of New England," was a famous children's schoolbook published sometime before 1690 by Benjamin Harris (*fl.* 1673–1716), who, in Sept. 1690, published the quickly suppressed first issue of the first newspaper printed in the colonies, *Publick Occurrences Both Forreign and Domestick.* The catechism contained woodcuts illustrating the alphabet, crude couplets and moral texts, including the child's prayer "Now I Lay Me Down to Sleep." Frequently revised, it was an important children's textbook for more than a century.

NEW FOREST, one of the few woodland regions left in England, covering 92,365 ac. in the southwest of Hampshire, between the Solent, Southampton Water and the river Avon. The crown has the right to keep enclosed and planted 16,000 ac. Pop. of rural district (1938) 36,660. Area 148.4 sq.mi.

The New forest is one of the five forests mentioned in Domesday. It was a hunting ground of the West Saxon kings, but derives its name from the extensive afforestation schemes carried out in the region by William the Conqueror in 1079. The deaths of two of his sons within its confines—Richard killed by a stag and William Rufus by an arrow—were regarded in their generation as a judgment of heaven for the cruelty and injustice perpetrated by their father when appropriating the forest. One of the chief sources of the wealth of the forest in early times was the herds of pigs fed there. The New forest, being under the forest laws, was affected by the forest clauses of Magna Carta and by the Forest charter (1217), which mitigated their severity. The chief officer was the justice in eyre who held the justice seat, the highest forest court. The lower courts were the Swainmote and Wodemote, the former of which is still held, in a modified form, in the Verderers' hall of the king's house at Lyndhurst.

The circuit of the justices in eyre, or their deputies, continued down to 1635; they were virtually ended by the Act for the Limitation of Forests (1640), though Charles II attempted to revive them, and they were not legally abolished until 1817. The lower officers of the forest, who held merely local appointments,

were the verderers, the regarders, the foresters, the woodwards and the agisters. There was also a lord warden, who was usually a nobleman and performed no judicial functions. The Deer Removal act (1851) resulted in the almost total extinction of the forest deer. Under the act of 1877 the forest is administered as a national park. About one-fourth of the area is under cultivation by private owners and tenants, and the remainder is open woodland, bog and heath. The principal village within the forest is Lyndhurst (pop. [1932], 2,594), with the verderers' court, in charge of the crown portion of the forest. On the western outskirts lies the town of Ringwood (*q.v.*). Beaulieu village on the estuary of the Beaulieu river has ruins of Beaulieu abbey, founded by King John for Cistercians. The gatehouse is restored as a residence, and the Early English refectory as a church. There are considerable remains of the cloisters, chapter house and domestic buildings.

NEWFOUNDLAND. An island off the northeast coast of North America, lying roughly between the parallels 52° and 60° N. lat. and the meridians 47° and 52°; together with Labrador (*q.v.*) on the mainland it forms the tenth province of Canada, having joined the confederation on March 31, 1949. The total population of the island, 1951 census, was 361,416; the capital, St. John's, had a population of 52,873.

Physical Features.—Newfoundland lies across the Gulf of St. Lawrence, separated from the main continent by the Strait of Belle Isle (11 mi. across at the narrowest point) on the northwest and by 70-mi.-wide Cabot strait on the south. Newfoundland forms a rough isosceles triangle, with sides about 320 mi. long. Its area is 42,734 sq.mi., of which 5,721 sq.mi. are fresh water. The coastline, which totals about 6,000 mi., is much indented, with headlands and peninsulas thrust out boldly into the Atlantic, or into the Gulf of St. Lawrence. Two of these, the Avalon peninsula and the Northern peninsula, form an appreciable portion of the island.

Geology.—It seems probable that the structure of Newfoundland was determined essentially far back in Devonian times (about 300,000,000 years ago). A subcontinent known as Greater Acadia occupied land and sea near Newfoundland, and this was corrugated into northeast-southwest folds in the Newfoundland region and in the Canadian Atlantic coast provinces, as well as in adjacent United States. These folds are still obvious in Newfoundland, though most of Greater Acadia has sunk beneath the sea. The harder formations stand out as the numerous promontories, the softer beds have been eroded to form the shallow valleys and deep bays of the island. (*See* map.)

In Carboniferous times swamps and forests in the White bay depression gave rise ultimately to beds of workable coal, especially near St. Georges bay. During later Permian times—when the Appalachian mountains were elevated in the U.S.—only minor folding affected Newfoundland.

In Tertiary times there was pronounced uplift of the whole island, which previously had been a peneplain near sea level. The west was elevated about 2,000 ft., while the east was only raised about 800 ft. A good deal of faulting probably occurred in Tertiary times, and this seems to have produced the Long Range horst (elevated block rising to a maximum of slightly more than 2,500 ft.) all along the west coast, and the Humber graben (depression) between Corner Brook and White bay. During the Pleistocene ice ages the island was covered with ice; only a small amount of glacial debris is found on the elevated plateaus, but much in the valleys. The lakes were gouged out a little deeper by the ice, and the outlet of the Humber near Corner Brook was probably widened. Rounded hills, U-shaped valleys and coastal fjords are other evidences of these extensive ice forces. The geological zones agree with the dominant fold axes of the island, and are shown in a somewhat general fashion in the accompanying map.

Drainage is mainly toward the east and the northeast. Only two major rivers, the Humber and the St. George, pierce the mountains of the west coast. The other great rivers, the Gander, the Exploits and the Terra Nova, empty into eastern bays. Innumerable lakes and ponds dot central Newfoundland. The most considerable are Red Indian lake, Grand lake and Gander lake.

The climate of Newfoundland is moderated by the close presence of the ocean. The extreme range of temperature is between 0° and 81° F. February is the coldest, August the warmest month. Both rainfall and snowfall are heavy, although the latter is not so heavy as in neighbouring parts of Canada. In general, the western coast of Newfoundland experiences a much more continental form of climate than the east coast. The southern and western coastlines, between St. John's and the Bay of Islands, are never icebound. Elsewhere, ice blockades, caused by wind conditions, are known to occur.

History.—The precise date of the discovery of Newfoundland by Europeans cannot be determined. Recent investigation upon the subject of transatlantic navigation suggests that Newfoundland and the Grand Banks fishing ground were well known considerably before John Cabot made his voyage in 1497. Ships from Bristol and the western English ports were engaged in the Icelandic and northern fisheries from at least a century earlier. Cabot gave emphatic advertisement to the wealth of the western waters, an advertisement reinforced by the Portuguese explorer, Gaspar Corte-Real, in 1501. By the first quarter of the 16th century, French, Basque, English and Portuguese adventurers were fishing regularly off Newfoundland. By 1534 the chief features of the coastline were known and named. The term Newfoundland is probably a modernized form of the generic "new-found-land," which was used in the Cabot charter of 1496.

Newfoundland occupied a vital place in the scientific and military activity of the 16th century: it was associated with the search for the northwest passage, and it was of great strategic importance in the Anglo-Spanish maritime contest. In 1583 Sir Humphrey Gilbert formally annexed Newfoundland for England and, in the course of the next 30 years, attempts were made to colonize the island. In 1610 the London and Bristol company planted a colony at Cupids, on Conception bay. The leader of the Cupids colony was John Guy. Colonization was attempted also in the Avalon peninsula by Sir William Vaughan, Lord Falkland and Sir George Calvert, later Lord Baltimore. The Baltimore colony at Ferryland promised well, till its proprietors procured the patent for Maryland in 1632. In 1637 all Newfoundland, including the Baltimore holdings, was transferred to Sir David Kirke and his associates. Although the Kirke family seems to have retained possession till the 1670s, efforts at permanent settlement were at an end; 17th-century economic theory and practice far preferred the codfisheries to established colonies.

The Old Colonial System, 1633–1800.—Throughout the 16th century the codfisheries attracted great annual expeditions from maritime Europe. In England, these reached the position of supreme national importance. Poole, Bristol, Exeter, Teignmouth and the other western ports became the centres of English enterprise, thus establishing in the Newfoundland trade a dominance which endured for more than two centuries. In contrast to the practice of the continental Europeans, the English adventurers engaged in "dry fishing." That is, having made their catch, the English dried the codfish on the island. Under favourable climatic conditions, from five to six weeks were sufficient for this process. The cod were then shipped overseas, the best fish going to the Mediterranean, the least valuable to the slave plantations in the West Indies. Marketing was done by large merchant vessels, or "sack" ships. The sack ships brought to Newfoundland the all-essential salt; in the late autumn they returned to England with wine or oil, or with the more precious bullion from abroad. In the eyes of the 17th- and 18th-century theorist, these transactions had a double value: first, they made England the beneficiary of the profitable export trade in dried cod. Second, the western fisheries were a great nursery of hardy seamen. It is not surprising, therefore, that the fisheries were regarded as being of fundamental importance to England's security and prosperity. It was manifestly contrary to national policy to permit permanent settlement, or to allow the fishermen to winter in Newfoundland. It was equally in the interests of the western merchants to discourage settlement. Accordingly, they adroitly identified their private interests with the widely accepted mercantilist theories, and argued that possession of the fisheries was synonymous with maritime

supremacy.

In pursuance of this policy the western merchants secured valuable fishing privileges. One of these, the Western charter, issued in 1634 and reissued in 1661 and 1670, prohibited settlement on the coast of Newfoundland. The culmination of discriminatory legislation was reached in 1698. The act (10 and 11 William III cap. 25) refused to recognize the private ownership of fishing stages, and forbade any islander to appropriate a stage till all the overseas fishermen were accommodated. Thus the monopoly of the adventurers was secured, and Newfoundland relegated to the role of accessory to the overseas fisheries.

BY COURTESY OF THE NEWFOUNDLAND TOURIST TRAFFIC DEVELOPMENT BOARD

COAT OF ARMS GRANTED TO NEWFOUNDLAND BY ROYAL LETTERS PATENT DATED JAN. 1, 1637

The intensification of maritime rivalry probably forced the issue. In 1662 the French established themselves at Placentia; in 1665 the Dutch burned St. John's, even at that early date a centre of English trade. Beginning with 1696, the French made concerted attempts to conquer Newfoundland, clearing the English out of their establishments in the Avalon peninsula and, early in 1697, attacking their stations in Conception bay. These exploits were repeated by the French in 1705 and again in 1709. By the terms of the treaty of Utrecht (1713), the French recognized English sovereignty over Newfoundland, although they retained valuable fishing privileges between Cape Bonavista and Point Riche. These concessions graphically indicate the high value set on the fisheries by both French and English. The ultimate settlement of these claims was postponed for nearly two centuries. During the Seven Years' War (1756–63), Newfoundland became again a centre of conflict, St. John's being lost and retaken by the English in 1762. During the American and French Revolutionary Wars, Newfoundland's coasts were ravaged afresh.

The subordination of Newfoundland's social and political development to the codfisheries was complete. After the failure of the early colonization schemes, authority was chaotically exercised by the fishermen themselves, under the title of "fishing admirals." In 1729 an officer of the royal navy was appointed governor. His tenure was seasonal, as was that of his successors till 1817. The naval governors wholeheartedly sought to aid the overseas fisheries as auxiliary to national policy. As late as 1775, Palliser's act (15 Geo. III cap. 31) attempted to forestall settlement by refusing to recognize the right of private ownership. In 1791 a civil court was instituted and, in 1792, a supreme court. In this way the earliest attempt was made to introduce an element of constructive order into Newfoundland affairs.

The population of the island was almost entirely seasonal, the fishermen returning each autumn to England; as late as 1683–84 there were only 120 permanent residents on the island. Throughout the 18th century numbers increased from 3,400 in 1754 to more than 12,000 in 1774. Settlement spread north from Cape Bonavista and west from Placentia.

The newcomers were drawn increasingly from Ireland to provide inexpensive labour for the codfisheries. Food and supplies were brought in from New England. Thus were the less favoured members of the empire subordinated to maintain England's monopoly of the Newfoundland staple industry. The great prosperity the fisheries enjoyed in the late 18th century probably accounted for the steady increase in population, which by 1804 reached 20,000. The peak year was 1814–15, when more than 11,000 immigrants arrived in St. John's from southern Ireland.

The prosecution of the shore fisheries was left chiefly to these newcomers. The prosperous deep-sea fishermen became resident merchants, buying dried cod, fish oil and sealskins for speculation abroad. Their headquarters were St. John's, which to its old character of a fishing station added that of a distributing and financial centre. Between the poor English and Irish "youngsters" (*i.e.*, employees) and the merchant oligarchs, a vast social and economic gulf was set. This cleavage may explain the disturbances in Newfoundland during the French Revolution, particularly the abortive mutiny of part of the local defense force in 1800. By the end of the 18th century, therefore, the hold of the old colonial system on Newfoundland life was weakening sensibly.

Representative and Responsible Government.—As early as 1802 Gov. James Gambier proposed that a form of representative government be granted Newfoundland. A decade and a half later the colonial secretary instructed the governor (Adm. Sir Francis Pickmore) to advise the British government in the matter of administrative reform. The leading advocates of self-government in the island were William Carson, a politically inclined Scottish physician, and Patrick Morris, an Irish-born merchant. Opposed to any reform were the agents of the great western interests and the local merchants. In 1832 representative institutions were established with a bicameral legislature, the lower house of which was elected on a broad franchise. From an early period discord developed between the two houses. The legislative councillors were residents of St. John's, and representative of the economically dominant "fishocracy" of the merchants; the assembly was a much more popular body. So serious did the collisions be come that in 1841 the constitution was suspended. In 1843 it was restored partially, a unicameral or amalgamated legislature being set up. In 1847, however, the old constitution was restored. The amalgamated houses enacted much useful legislation: a general education act; a road-building program; aid to agriculture. From 1848 onward, agitation was set in train for complete responsible government. The colonial office withheld approval until 1855. In that year full legislative responsibility was admitted, on the analogy that what had been recognized in Nova Scotia and Canada could not be withheld in Newfoundland. An adequate civil list and a parliamentary redistribution were effected and, thus equipped, Newfoundland emerged as a completely self-governing community.

Economic Maturity, 1800–70.—Increasing economic maturity underlay the constitutional changes. The early 19th century was characterized by the growth of the inshore fisheries, as distinct from the bank fisheries. The war years, especially from 1800 to 1815, drastically curtailed the deep-sea fisheries. The bank fisheries did not recover their former importance, the dominant economic position passing to the shore fisheries. These fisheries were prosecuted by resident Newfoundlanders, and their rise was responsible for the political changes of 1832. During the war years the Newfoundlanders established a virtual control over the Mediterranean market for dried cod. In 1813 and 1814 they established an important new market in Brazil. Peace brought a disastrous fall in the price of dried fish, occasioning a prostration in business which lasted until 1818 or 1819. Thereafter, till the middle of the 19th century, the export of cod remained remarkably constant.

An important adjunct to economic prosperity was the seal fishery. From the middle of the 18th century, the people of the northern bays took a few seals annually by means of nets. Somewhat later, small boats were employed. These ships sailed each spring for "the ice," in order to intercept the great herds of seal on their migrations. In 1831 and 1844 phenomenal catches were made, 686,830 and 685,530 respectively. The industry gave employment to a large number of men and brought handsome returns to the capitalists who directed it. In 1857, 13,600 men shipped for the ice; the catch was valued at $1,700,000. After the middle of the century, sealing declined.

Throughout this period, concerted efforts were made to broaden the economic basis of island life. Sir Thomas Cochrane, the first governor under the representative system, attempted to forward road building and farming. Under the direction of Sir John Harvey in the '40s, agricultural societies were formed in an effort to put farming on a rational and extensive basis. The success of these efforts may be judged by the progressive increase of land under cultivation: 1836, 11,062 ac.; 1845, 29,656 ac.; 1855, 41,108 ac. The majority of such holdings were small, usually being worked as auxiliary to the all-absorbing fisheries. Nevertheless,

they did impart a degree of self-sufficiency and permanency to Newfoundland life.

Allied to the fisheries were overseas commerce and banking. Newfoundlanders were excellent shipbuilders and frequently sailed the vessels they constructed to the Mediterranean and the Caribbean. Foreign shipping, chiefly Spanish and German, crowded St. John's. The history of banking in Newfoundland begins with the opening of a branch of the Bank of British North America in 1836. In 1844 the Newfoundland bank was incorporated; in 1854 the Union bank; in 1857 the Commercial bank. The last three were local institutions, and their success demonstrates the competence of Newfoundlanders to direct all phases of their economic life in the mid-19th century.

The social development of the island kept pace with the economic. The merchant class became Newfoundland by birth and outlook and, with the rise of the enterprising Irish shopkeeper, began to lose its exclusively Anglican caste. The outport merchants, with the increasing importance of the seal fishery, played a more decisive role in business life. St. John's was transformed gradually into a commercial centre and colonial capital. In 1800 the population of the city was about 3,000, living along two narrow paths which straggled on the north side of the harbour. A series of disastrous fires in 1816, 1817 and 1819 largely destroyed the ancient malodorous fishing town and made possible a degree of planning. In 1846 another fire hastened this process and opened the way for such improvements as a general water supply system, the St. John's Water company being incorporated in 1846. In this period, some of the most conspicuous landmarks of St. John's took form. In 1841 the cornerstone of the Roman Catholic cathedral was laid; in 1855 the church was consecrated. In 1843 the building of the Anglican cathedral was commenced.

The Newfoundland churches owe their modern organization to the early 19th century. In 1847 the Roman Catholic diocese of St. John's was erected. Catholic worship had been conducted regularly as early as 1627 in the Baltimore colony; a prefecture was created in 1784 and a vicariate in 1796. The early clergy were Irish Franciscans, an arresting commentary on the close integration of social and religious forces. The opening of a diocesan seminary in 1857 made possible the training of a native clergy and the formation of a completely indigenous church. The Anglican diocese of Newfoundland was created in 1839. Provision for Anglican worship was made as early as 1583, and the first Anglican minister reached the island in 1610. The consecration of Bishop Edward Feild in 1844 introduced the modern period in church extension and education. Methodism was introduced into Newfoundland in 1764, establishing itself strongly in the northern outports. In 1855 the Methodist churches joined the Eastern British American conference, thus breaking the administrative connection with England. The entrance of the Methodist Church into the United Church of Canada was effected in 1925. Organized Presbyterianism dated from 1842. The other chief religious bodies, Salvation Army, Adventists and Pentecostals, came into being at a later time.

In the decade of the 1860s Newfoundland passed through a confusing period. The conventional historian employs alarmist language to describe the lean years 1860–68, and ascribes the economic collapse and social demoralization to the decline of the fisheries. A critical examination of the available evidence suggests that equally potent factors were poor harvests, occasioned by prolonged drought, and the dislocation of the southern market for cod, produced by the U.S. Civil War. Against this dark picture must be contrasted the unchallenged statement, made in 1864, that Newfoundland was in a sounder financial position than any other British American community. By 1869 good harvests, supplementing abundant fisheries, brought prosperity. In 1869, also, the proposition of including Newfoundland in Canada was rejected at a general election. Whatever local or temporary issues were involved, the rejection may be regarded as symptomatic of the economic well-being of Newfoundland in the mid-century.

The Age of Local Enterprise, 1870–95.—The quarter century (1870–95) was one of general prosperity. This may be ascribed to the progressive broadening of economic life through farming and mining, and also to the stimulus of railway building. An additional reason was the high price the increasing exports of dried codfish commanded. In an era of general price decline, the price level of dried fish remained almost stationary. Thus the fisherman had the absolute advantage of a high selling price and the relative advantage of greater purchasing power. Moreover, the capitalistic enterprises of the period were locally managed and financed. The intrusion of alien direction and control following 1895 may be regarded as closing one period in Newfoundland history.

The search for economic self-sufficiency was initiated as early as the '60s. The rapid increase in population (1857, 124,288; 1869, 146,536; 1874, 161,374) gave a note of urgency to these investigations. In 1862 two committees of the legislature examined the fisheries and agriculture and in 1864 the geological survey of the island was begun. Independent of, but associated with this was the discovery of copper ore at Tilt cove on Notre Dame bay. Working was begun in 1864 and by 1879 the mine had yielded $1,572,514 of copper and $32,740 of nickel. Other mines, notably at Bett's cove, gave even greater yields, producing minerals valued at $2,982,836 between 1875 and 1879. The discovery of considerable deposits of lead, coal and other minerals on the west coast increased optimism and stimulated efforts to promote ways and means to exploit these new forms of wealth.

Railway construction became the great end of national policy. In 1875 Sir Sandford Fleming, the engineer of the Canadian Pacific, surveyed a practicable route from St. John's to St. Georges bay. Difficulties raised by the colonial office, lest such a line trespass on French privileges, delayed the construction of the railway as originally projected. In 1880 a joint committee of the legislature recommended the building of a railway northward, as the best means of making accessible the mining and agricultural regions of Notre Dame bay and Exploits valley. In 1881 a company was incorporated and construction begun. The company was aided by government subsidies of $180,000 per annum for 35 years, and a land grant of 5,000 ac. for each completed mile. At the same time, new enterprises were initiated at St. John's. In 1882 a ropewalk was established for the manufacture of fishing gear, netting, cordage and cables, thus freeing Newfoundland from its dependence on foreign sources for these indispensable supplies. Between 1882 and 1884 a large dry dock was constructed. Other industries developed locally, foundries, machine shops and engineering works, all associated with the railway or with shipping.

In the early 1890s two disasters altered completely the pattern of Newfoundland growth. In 1892 three-quarters of St. John's was devastated by fire. The damage to property was computed at $20,000,000, of which less than one-quarter was covered by insurance. In Dec. 1894 the two leading banks, the Commercial and the Union, failed, while the Government Savings bank was compelled to suspend payment. The notes of these banks, the normal currency of the island, became valueless, business stagnated and workingmen were dismissed. As the Union bank was under obligation to provide the half-yearly interest (about $225,000) on the public debt, the crisis assumed a serious shape. A loan from the United Kingdom serving for immediate relief, Newfoundland sought permanent solution by union with Canada. The insistence of the Canadian government on certain debt settlements caused the negotiations to break down early in 1895. Left to their own devices, Newfoundland public men, directed by Sir Robert Bond, succeeded in raising loans in Montreal, New York and London, thus staving off the danger of complete financial collapse.

The bank failures brought to an end a distinct era in Newfoundland history. Local enterprise had been overwhelmed by disaster. The Canadian banks entered the island and their notes replaced the local Newfoundland dollar. Five years before, Sir Robert Reid of Montreal had become influential in pushing the construction of the transinsular railway. By these means, alien direction invaded the business life of Newfoundland.

The Era of Foreign Investment, 1900–30.—For the first 30 years of the 20th century, Newfoundland development followed

a consistent pattern. Foreign enterprise increasingly sought to exploit Newfoundland's natural resources. As a corollary, Newfoundland standards of living sought approximation to standards elsewhere. World War I intensified this process. The liquidation of long-standing differences with France and the United States was a feature of this period.

As early as the 1890s, foreign investment was attracted to railway construction and mining. The decision to build a transisland railway brought in Sir Robert Reid, a Scotch-Canadian promoter of great practical experience. The financial disaster of 1894–95 induced the government in 1899 to transfer to Reid virtually all the island's communications, railway, shipping lines and telegraph, as well as the St. John's dry dock and extensive timber and mining rights. Strong protest produced an amendment of the contract in 1901, whereby the more objectionable monopolistic features were surrendered at the price of about $2,500,000. Construction was pushed vigorously; in 1893 the railway reached Norris Arm on the Exploits; in 1897, Port aux Basques. Fast steamships were put in service between this point and Sydney, N.S. The profitable working of these enterprises proving increasingly difficult, in 1923 the government assumed their operation as part of the public charge. In 1895 the exploitation by a Canadian company of the iron deposits on Bell Island commenced.

In 1905 the Anglo-Newfoundland Development company was constituted for the manufacture of newsprint. The company was originated by Lord Alfred Charles Northcliffe, who wished to make his chain of newspapers independent of foreign countries for supplies of print. The location of the original plant was at Grand Falls, where the company received power rights on the Exploits river and timber limits amounting to 2,000 sq.mi. The first paper was produced in 1909. For export purposes the company installed docks and sheds at Botwood, which was connected with Grand Falls by private railway. Since its establishment, the Anglo-Newfoundland Development company was much expanded. In 1923 it acquired the pulp mill of the Albert Reed company at Bishop's Falls. It also increased its timber holdings to 7,400 sq.mi. The plants at Grand Falls and Bishop's Falls were modernized completely. The rise in production may be accepted as an accurate commentary on the company's efficiency. In 1909 and 1910 the original mill produced 30,000 tons of newsprint. By 1912 production was doubled; in 1933 it stood at 100,000 tons annually. In carrying out surveys, officials of the company discovered outcroppings of copper-lead-zinc ore on Buchans river. It was not till 1925, however, that these deposits were made profitably exploitable. The American Smelting and Mining company undertook development under agreement with the parent Anglo-Newfoundland company. Mining operations were begun in 1927. In 1931 the plant was enlarged, obtaining a production capacity of about 1,200 tons of ore daily.

In the era following World War I came the exploitation of the timber resources of the west coast. The potentialities of the region were well-known, but it was not until after 1919 that development was undertaken seriously. The leader was Sir Richard Squires, then the prime minister, and one of the most vocal exponents of exploitation by means of foreign capital.

World Depression.—In 1931 Newfoundland began to experience the effects of the world depression. These were intensified by the heavy service charges on the Newfoundland debt. Throughout the 1920s, the program of railway consolidation and highway construction, along with increased aid to education, raised the national debt from $43,000,000 to $101,000,000. Moreover, the budgets had not been balanced after 1920, the annual deficits amounting to an average of $2,000,000. The deficits were met by loans, which, of course, added to the general indebtedness. The onset of the depression, therefore, found Newfoundland in a dangerous financial position. By an unfortunate coincidence, Newfoundland's best customers for newsprint, minerals and dried cod were themselves affected seriously. Employment declined in Canada and the United States, forcing home scores of seasonal workers. Throughout 1930, 1931 and 1932, the shore fisheries were low, with the result that in the winter of 1932–33 about one-quarter of the population was on relief. In 1931 a loan for $8,000,000 received no tenders. Upon request, a financial adviser for the government was dispatched from the United Kingdom. In 1932 loans were successfully raised from the Canadian banks and from local subscriptions. An unusual feature of this agreement was the provision which gave the Imperial Oil Company of Canada a monopoly of the import of petroleum products in return for an annual subsidy of $300,000. Drastic cuts were made in expenditure and taxes steeply increased. During 1933, however, no improvement was visible, and additional loans were sought from the governments of Canada and the United Kingdom: January, Canada-United Kingdom loan, $1,250,000; July, United Kingdom loan, $1,850,000. At the same period, application was made for the appointment of a royal commission to inquire into Newfoundland affairs.

Commission of Government, 1934–49.—In February a royal commission was appointed. It consisted of three members, a Newfoundlander, a Canadian and a representative from the United Kingdom. The terms of reference stressed the examination of Newfoundland's financial situation and prospects. The royal commission met throughout the summer of 1933, gathering information on Newfoundland life. A report of these investigations, along with certain recommendations, was published in the autumn of 1933.

The report was a comprehensive document, containing an extensive survey of Newfoundland's existing condition and past history. The ills of the dominion were set down to the functionings of a perverted parliamentary system which had been exploited for party and personal gain. As a solution, the royal commission recommended the temporary suspension of responsible government. It recommended, also, that the government of the United Kingdom should assist Newfoundland financially until such time as the dominion became self-supporting. Other recommendations touched the rehabilitation of the fisheries, the revision of the educational system, and so on. The constitutional proposals were startling since they envisaged the establishment of a unique body, the commission of government, which should exercise both legislative and executive functions. A candid analysis of the report suggests that the royal commissioners misunderstood the nature of Newfoundland's difficulties and that they were anxious chiefly to protect the holders of Newfoundland securities. These were, principally, British, Canadian and United States. In the 1920s Newfoundland had borrowed about one-half its funds from New York. It is probable that the dominion office feared the consequence to British financial prestige of the default of Newfoundland; hence the extraordinary measures suggested to ensure solvency. Early in the winter, the Newfoundland legislature debated the report, and accepted the recommendations. The British parliament thereupon examined the measure, which became law in Dec. 1933. The chief critic of the proposed change was the Labour party. It attacked the bill as designed to assist the *rentier* class, and as constituting a dangerous precedent in dictatorship.

In its operations, the commission of government encountered a number of difficulties. The most obstinate were the low prices tendered for Newfoundland's primary products. As such prices were determined by world conditions, their improvement was beyond the power of local administration.

The program of the commission was assisted, however, by advances from the British treasury. Deficits in ordinary expenditure were met by grants-in-aid; money for capital outlays was borrowed from the Colonial Development fund. The annual deficits were in the neighbourhood of $1,500,000. In order to effect economies, the commission carried out an extensive conversion scheme. In this way, the cost of debt service was reduced by more than $2,000,000 annually. The government of the United Kingdom guaranteed both interest and principal of the new sterling 3% stock issued to replace the old Newfoundland securities. In matters of finance, the commission of government, like the parliamentary regime which preceded it, was unable to find an equilibrium between expenditure and income. The artificial character of the budgetary balances must not be overlooked.

The most substantial advances made by the commission were

in administration and in administrative reform. At an early period, the tariff was subject to thorough revision. Customs duties had been for long the staple of Newfoundland finances, producing in normal times about three-quarters of the dominion's revenues. During the depression years, the tariff had been so steeply increased that the law of diminishing returns was operating. The commission simplified and reduced the tariff (Revenue act, 1934). The result was a considerable increase in revenue, which rose from $7,043,504 in 1935 to $8,683,181 in 1938.

Another promising accomplishment of the commission was land settlement. The experiment was begun in the winter of 1933–34 by a group of St. John's citizens. The success of the Markland scheme attracted the attention of the government. Under the direction of the Land Settlement board, and later under the department of rural reconstruction, the Markland scheme was repeated elsewhere. To subsistence farming, winter logging, fishing and lobster canning were added. The moral value of such settlements was great. Stimulation to the co-operative movement was given formally in the Co-operative Societies act (1939), which sought to make the principle of self-help operative throughout the dominion. In sponsoring these measures, the commission of government indicated its awareness of problems other than the material.

With the advent of World War II the island, because of its bastion position off the North American continent, at once began to play a major role. Air bases were created and garrisoned by the United States and Canada; the harbour of St. John's became an important naval base and convoy point; and Newfoundland raised troops for service in Europe. The impact of World War II on the economic, political and social life of the island was heavier, more disturbing and more prolonged than the impact of World War I had been. By 1945 boom conditions prevailed in many parts of the island. Throughout the 1939–45 period the commission of government continued, but in the years following the end of the war the future of Newfoundland's government became increasingly controversial.

Confederation with Canada, 1949.—Partly because of the effect of World War II on the economy of the United Kingdom, that country was reluctant to continue the financial and other aid extended to the island under the commission of government. Many Newfoundlanders were themselves anxious to see the end of the commission of government, which they felt was only a temporary if necessary expedient, and certainly an undesirable intrusion of autocracy. However, some did favour a retention of the paternalism of the commission. In addition, there was a resurgence of the 1895 union-with-Canada movement. Thus three main types of agitation developed: retention of the commission; return to responsible government (dominion status under the 1931 Statute of Westminster); confederation with Canada. There was a minor and abortive move for economic union with the United States. A national convention was called in Sept. 1946 to discuss the problems. The convention ended its deliberations in Jan. 1948. Its final decision was United Kingdom permission for an island referendum on June 3, 1948, with three alternatives: (1) commission of government (for five more years and then another referendum); (2) responsible government; (3) union with Canada. The vote was respectively 23,311, 69,400 and 64,006. Because under the referendum arrangement there was no clear majority for any alternative, a second ballot was taken July 22, 1948, which resulted in 71,334 votes for responsible government and 78,323 votes for confederation. (Eighteen of the 25 electoral districts established in 1933 showed a clear majority for the union.)

Negotiations for union opened in Ottawa on Oct. 6, 1948; the terms were signed Dec. 11; the Canadian parliament approved the terms (13 Geo. VI., c. 1) on Feb. 18, 1949; the commission of government announced its approval on Feb. 21; the British parliament confirmed the arrangement on March 23; and in accordance with the terms Newfoundland (comprising the island of Newfoundland and the islands adjacent thereto and the coast of Labrador as delimited by the judicial committee of the imperial privy council in March 1927) joined Canada as its tenth province at midnight on March 31, 1949. The terms were complicated, but the main constitutional, financial, taxation, welfare and public service provisions were as follows:

Constitutional.—The British North America acts, 1867 to 1946, except for such provisions that affect only one or more and not all of the provinces, and the Statute of Westminster, 1931, apply to the province of Newfoundland in the same way that they apply to the other provinces; the new province is entitled to six senators and seven members in the house of commons, with readjustment as population changes; a provincial government was created.

Financial.—The federal government assumed responsibility for the island's sterling debt; subsidies were of several kinds: (1) a fixed annual payment of $180,000; (2) an adjustable annual payment of 80 cents per capita; (3) a special subsidy of $1,100,000 in recognition of the island's special problems of geography; (4) a transitional grant of $42,750,000 to be paid over a 12-year period; (5) a royal commission to be appointed before 1957 to review the financial position of the province.

Taxation.—An agreement for the rental by the federal government of personal income, corporation income, corporation taxes, succession duties.

Welfare.—The extension of federal unemployment insurance, family allowances, veterans' benefits, merchant seamen's benefits, old-age and blind pensions, health grants, housing assistance to the island.

Public services.—Railway, steamship, postal, telecommunications, civil aviation, defense, customs and excise, public radio, encouragement and protection of fisheries taken over by the federal government so as to relieve the province of Newfoundland of the costs incurred for such services.

Sir Albert Joseph Walsh was appointed first lieutenant governor on April 1, 1949, succeeded by Sir Leonard Outerbridge, C.B.E., on Aug. 17, 1949. Joseph R. Smallwood, a Liberal and one of the chief architects of confederation with Canada, was appointed the province's first premier on April 1, 1949. On May 27 he held the new province's first election, in which 22 Liberals, 5 Conservatives and 1 independent were returned.

Economics.—Geographical factors have had a powerful influence on the economy and the characteristics of Newfoundland. The arctic currents keep the coastal waters cool, thus producing ideal conditions for the fisheries. They make for late springs, temperate summers and damp autumns, thus putting agriculture under a handicap. These circumstances made Newfoundland a producer of a number of relatively simple staples; hence, the island had not attracted a large population nor had it developed extensive secondary industry by mid-20th century.

Farming in Newfoundland developed slowly. It was not until 1813 that land could be held for agricultural purposes. The shortness of the season and the lack of fertility of the soil in the more settled areas of the island were additional hindrances. In spite of numerous efforts in the 19th century, farming was not undertaken on a large scale. The majority of the farms are small, usually in the nature of garden plots cultivated to supply the fisherman with his year's vegetables. In the Avalon peninsula, chiefly in the Waterford valley, and also on the west coast, in the Codroy valley and on the Bay of Islands, some mixed farming is done. On the larger farms of 100 to 200 ac., cereals can be grown. Elsewhere, however, farming usually takes the form of vegetable raising. The relatively high prices these commodities command in the local market stimulate their production. Cultivated fruits have little export value, but wild fruits are sent in large quantities to the United States. Successive governments attempted to stimulate farming, usually by granting bonuses for land clearing. The commission of government continued this policy. It established, also, a demonstration farm, to which an agricultural school is attached. District agricultural officers were appointed to advise the farmers as to crops, fertilizers, and so on. The department of rural reconstruction sought to develop subsistence farming as a means of increasing the independence of the fisherman. It gave its support to various self-help organizations and co-operative societies. After confederation in 1949, the provincial agricultural division continued and intensified this work. Subsidies took the shape of bonuses for purchase of purebred

sires, in addition to land clearing, and a soil survey service was maintained. By these means, the government attempted to mitigate some of the prejudices against which, and the difficulties under which, farming labours.

The forest industries are very important. Woodlands cover at least 25,000 of the 42,734 sq.mi. of the island. The best timberlands are found along the rivers and in the bottom lands, chiefly in the Exploits valley on the northeast coast and in the Humber valley on the west coast. The commonest woods are black and white spruce and balsam fir. These are extremely valuable, not only for local manufacturing purposes, but also for making newsprint. In some sections are considerable stands of white pine; in others, birch and juniper. At mid-century more than 600 sawmills drew on these forests for building material, cooperage stock and various lumber products, the value of these reaching the figure of about $1,000,000 annually. Pit props, as well as newsprint, are exported to the United Kingdom. The production of newsprint is one of the most important activities of Newfoundland. The pioneer in this enterprise was the Anglo-Newfoundland Development company which began to manufacture paper in 1909. In 1925 the Bowater paper mill was opened at Corner Brook, and it was enlarged in 1950 to make it the largest paper mill in the world. The administration of forests and the rental of timber limits are vested in the department of natural resources.

The mineral resources of Newfoundland are believed to be considerable. Formed as it is of ancient rock, it is said to contain almost all metallic substances. Iron, copper, zinc and lead are the chief minerals commercially exploited. Iron mining is carried on at Bell Island in Conception bay. The ore beds appear in the cliffs on the north side of the island, and seem to extend far under the sea. The ore is mined at Wabana, Bell Island, and is of first-class quality. In 1895 mining was actively commenced. In 1921 all the mines on Bell Island were acquired by the Dominion Steel and Coal corporation of Sydney, N.S. After the first ore was taken out in 1895, the Bell Island mines produced more than 28,000,000 tons of ore, valued at more than $75,000,000. In 1947, 1,280,000 tons of ore were mined. Some Bell Island ore goes to the United States and some to the United Kingdom but the bulk is exported to the company's furnaces at Sydney.

In central Newfoundland, at Buchans on Red Indian lake, copper, zinc and lead are mined. As early as 1906 the outcroppings were discovered, but it was not until after 1925 that the extraction of the metals became feasible. Operations were begun in 1927, and in 1931 the plant was further extended. The mine is equipped with modern machinery including a crushing plant, a concentrating mill and a hydroelectric plant. Between 1929 and 1932 the Buchans Mining company produced more than 325,000 tons of zinc and 140,000 tons of lead. In 1947 this mine produced 70,000 tons of zinc, 34,000 tons of lead and 16,000 tons of copper. Export is made by way of the Anglo-Newfoundland Development company's port at Botwood.

There are indications of other minerals in considerable amounts elsewhere. Coal is found in the neighbourhood of St. Georges bay on the west coast, with an estimated content of 147,000,000 tons. Copper mining was carried on profitably around Notre Dame bay between 1864 and 1918 when the mines were thought exhausted, but they were reopened in 1951 by the flotation process. In 1933 fluorspar veins were developed in the St. Lawrence peninsula. By 1939 two companies were engaged actively in the exploitation of this mineral and as late as 1951 Newfoundland led by far in Canadian fluorspar production. In various sections of the island gold, silver, nickel, chromium, antimony, asbestos and vanadium exist. In 1934 the commission of government organized a geological survey in order to make known the resources of the country. After confederation in 1949, federal geological parties operated on the island.

The fisheries are conventionally regarded as Newfoundland's chief industry. Proximity to the Grand Banks (*q.v.*) makes Newfoundland one of the world's greatest fishing stations. Fishing employs the most considerable number of persons in the province, and until the development of forest and mineral resources it provided the largest single element in the national income.

The codfishery is the oldest of the Newfoundland fisheries. It is pursued in three forms, inshore, on the Grand Banks and off the coast of Labrador. The shore fishery is followed from the coast in the summer months. It is engaged in by individual fishermen in small boats. Normally it accounts for more than half the total catch. The cod is cured by the fisherman and his family on the "flakes" (*i.e.*, wooden stages) which form such a distinctive feature of the Newfoundland shore. The dried cod is disposed of to the local merchant. The bank fishery is a deep-sea fishery conducted from schooners, locally called "bankers." The actual operation of fishing is done by dories, which play out lines carrying 1,000 hooks. The "bankers" make three voyages annually, in spring, summer and autumn. The catch is stored on board, heavily salted, to be cured when the ships return to land. The bank fishery represents about one-tenth the total catch. The Labrador fishery is followed in the summer and the autumn either as a shore or as a sea fishery. The Labrador fish are processed locally, or carried in salt bulk to Newfoundland.

The other fisheries are of relatively less importance, though still of major proportions. A considerable amount of salmon is dispatched frozen to the Canadian mainland and to the United Kingdom. Lobsters are taken on the south coast. Smelt and halibut are sent iced to the Canadian market. Herring are caught at all points around the coast, but only on the west coast has this fishery any commercial importance. The seal and the whale fisheries declined greatly, until in 1948 they brought in only $480,000 and $224,000 respectively.

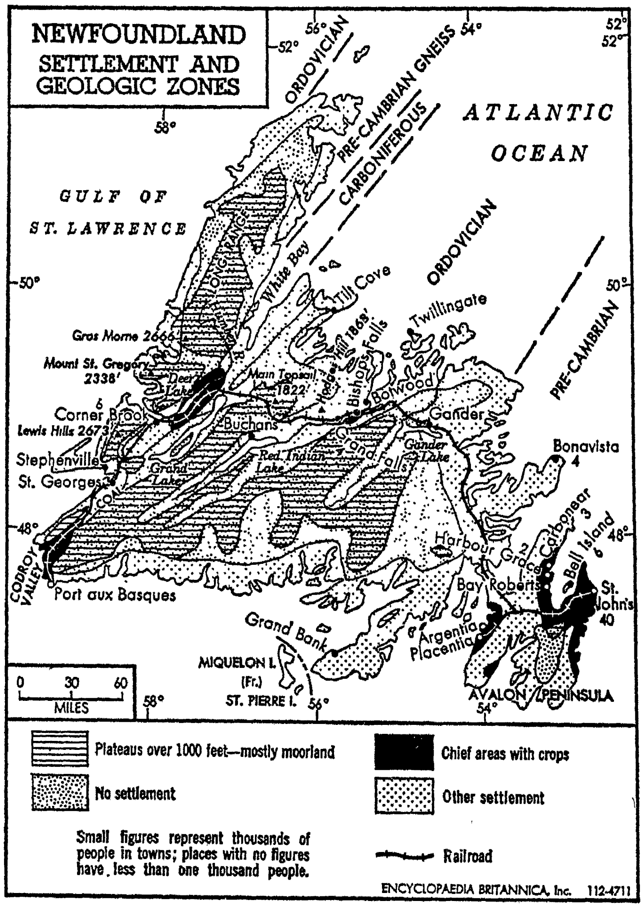
The various fisheries are conducted on a credit basis. Since a commodity is usually disposed of in a distant market, such an arrangement is almost inevitable. At the beginning of the season, the fisherman appeals to the local merchant for fishing equipment and for household supplies; at the end, his catch is valued, and any balance is squared in cash or goods. Should there be no balance, the fisherman remains in debt. The effects of the credit system, economically and psychologically, have been deplored by all students of Newfoundland life. The ramifications of indebtedness are extended by the fact that the local merchants operate on a credit granted by the great exporting houses of St. John's. Various efforts were made to overthrow this ancient system, and in 1933 the royal commission suggested the statutory substitution of a fraction of payment in cash. This proved unworkable. Later efforts in the direction of mutual-aid societies, fishermen's co-operatives, and so on, gave greater promise of success.

The chief markets for Newfoundland fish are the Mediterranean and Caribbean countries and Brazil. The export trade is primarily in dried, salted fish; little attempt is made to export cod, canned, filleted or smoked. During the 1930s, disturbances in the overseas markets profoundly affected the fish trade. Between 1928 and 1938 the value of the codfish catch fell from $11,500,000 to $4,000,000. In 1948–49 the export of salt codfish was worth $17,723,000, while other fisheries produced a further $14,485,000. As the codfisheries, directly or indirectly, affect about one-third of the entire population, the consequences of price decline are catastrophic.

Trade conditions make Newfoundland an exporter of primary products. Originally, this was exclusively dried codfish. In the 20th century, however, forest and mineral products outstripped the codfish export in value. In 1933–34 Canada supplied 39.96% of Newfoundland's imports; the United States, 28.18%; the United Kingdom, 23.51%. After 1935, the United States increased its business progressively in Newfoundland. An important trade agreement was made between the two in 1938. Under the terms of this agreement, the United States substantially reduced duties on a number of Newfoundland fish products, as well as upon frozen small fruits and certain minerals: At the same time, Newfoundland reduced its tariff on 47 United States manufactured commodities. The dislocation of international food supplies by World War II created a boom in Newfoundland fish, while its wood products and minerals also found ready buyers. As a result of confederation in 1949, the tariff arrangements became the same as those for Canada. The great bulk of Newfoundland trade is

conducted through the port of St. John's. Distribution is largely in the hands of the St. John's wholesale houses. The city has an excellent harbour.

Environment and Settlement.—No better example exists



RUGGED TOPOGRAPHY AND INFERTILE LAND COVER NEARLY THE ENTIRE ISLAND LEAVING ONLY A NARROW AND BROKEN FRINGE AVAILABLE FOR HABITATION

anywhere than in Newfoundland of the dominant part played by climate, topography and soil in the distribution of the settlement. Added to these natural controls, the strategic importance of Newfoundland in World War II led to a tremendous redistribution of population, though there was some readjustment when peace came. The key to settlement is of course the fact that agriculture is of little importance in the island. Conditions are quite different in Prince Edward Island, which lies only 170 mi. to the southwest: there, one finds the highest proportion of farmers in Canada, and farms cover the whole island. In Newfoundland (*see* map) there is no settlement away from the coast anywhere, except near Deer lake and near Red Indian lake. Few districts have average temperatures above 57° F. in July. The areas where there are a considerable number of farms are near Deer lake, in the extreme southwest in the Codroy valley and in the Avalon peninsula (*see* map). What is the explanation of this difference in the two St. Lawrence gulf islands? The southern island has a low flat undulating surface built up of relatively young Permian formations, and these conditions are eminently suited for a farming population. The northern island, as shown earlier, is an uplifted peneplain built of ancient sterile formations for the most part. Soils are carried from such a surface, whereas they tend to accumulate on a lowland surface. As a result there are numerous tiny fishing villages along every coast of Newfoundland except to the northwest. No roads or railways link these villages, and in all cases except perhaps in the northeast the shores are steep and there is little lowland even in the small bays or gulfs.

It is because of the position of Newfoundland, guarding the main corridor of entry into Canada, as well as forming a bastion to the narrowing waters of the Atlantic, that Newfoundland became of great strategic importance in World War II. The great airport at Gander was vulnerable after the fall of France in 1940; as also was Botwood, the seaplane base on the north of the island. (*See* map.) Canada sent large garrisons to defend these strategic points, while a new base was constructed at Torbay just north of St. John's. In the later months of 1941 a great airport was built at Goose bay in the interior of Labrador with the sanction of the commission of government in Newfoundland. In the same year the United States sent thousands of American soldiers and techni cians to build and occupy military stations at Quidi Vidi in the suburbs of St. John's; at Argentia on the southwest coast of the Avalon peninsula; and at Stephenville on the west coast south of Corner Brook (*see* map). This influx of Americans, with the consequent demands for local labour, brought about a period of wartime prosperity in many parts of Newfoundland.

Communications.—Communications are made by steamship through St. John's, or through Port aux Basques at the western end of the island. Until confederation the Newfoundland government operated steamers between Port aux Basques and Sydney, where connection was made with the Canadian railways. After confederation this service became the responsibility of the federal department of transport, and large new-style steam rail ferries were specially built for the run. Aeroplane service is maintained also for both transatlantic and for North American travel. In 1937 the British air ministry began to construct the Newfoundland airport at Gander lake. At the same time, an agreement was made between Newfoundland, the United Kingdom, Canada and Eire for the operation of the Atlantic route. Agreements were made also with the Pan American World Airways for connections with the United States points. For both oceanic and continental flying, Newfoundland occupies an increasingly important position. It is not without significance that every major transatlantic flight from that of Sir John William Alcock and Arthur Whitten Brown in 1919 used Newfoundland as a necessary part of the project. After confederation the federal department of transport assumed responsibility for Gander airport. Within the island, the most important medium of transportation is the Newfoundland narrow-gauge railway, a publicly owned utility, which crosses the country from west to east. The railway links such centres as St. John's, Grand Falls, Corner Brook and Port aux Basques. After confederation it became part of the publicly owned Canadian National railways system. There are, in addition, about 1,150 mi. of highway and 6,000 mi. of local road. Most of the mileage is on the Avalon peninsula, but there are important road connections in other areas, particularly in the neighbourhood of Corner Brook, Grand Falls and Millerton. The commission of government began the building of a 610-mi. transisland highway, which in June 1950 officially became the most easterly section of the Trans-Canada highway. Newfoundland is an important cable relay station. It was in 1858 that the first cable connection was made between Newfoundland and Ireland, but it was not till 1866 that permanent connections were successfully made. Until confederation the Newfoundland government maintained radio stations both on the island and in Labrador. After confederation they became the responsibility of the federal department of transport. It was in Newfoundland in 1901 that the first successful radio transmission was effected.

Political and Social.—Constitutionally, Newfoundland was first a British colony and then for nearly a century a member state of the British Commonwealth of Nations. In 1832 the island attained a form of representative government and, in 1855, self-government. From that date till 1934 the administration followed the conventional British overseas type: a governor appointed by the crown acting on the advice of an executive council, which in turn was dependent upon the support of a legislative council and a legislative assembly. The council was appointed; the assembly elected on practically universal adult suffrage, women having been enfranchised in 1925. The executive councillors were also heads of the departments of state, finance, public works, justice and so on. In 1934, as a result of grave economic difficulties, this type

VIEWS OF NEWFOUNDLAND AND LABRADOR

1. Paper mill, Corner Brook, Newfoundland
2. The main "city street" under the fish flakes, platforms for drying fish, at La Manche, a fishing port on the southern shore of Newfoundland. La Manche dates back to Newfoundland's earliest occupation by Europeans
3. Grenfell hospital, St. Anthony, Newfoundland, the headquarters of the Grenfell activities in Newfoundland and Labrador. The large building is used mainly as a receiving hospital for serious cases, while the building to the right is used as an orphanage
4. Grand falls, Hamilton river, Labrador. Famed for their magnificence, the falls are more than 300 ft. high

of responsible government was temporarily suspended. A body described as the commission of government assumed office in 1934, as a result of recommendations of the royal commission. The commission consisted of six members, three Newfoundlanders and three members appointed from the United Kingdom. The governor in commission communicated with the secretary of state for dominion affairs. The commission of government was an instrument unique in commonwealth practice, called into being in response to a temporary emergency, but it was not until 1949 that the emergency ended and the commission was recalled. At the union with Canada, a provincial government was created, consisting of a federally appointed and paid lieutenant governor and a 28-member legislative assembly elected (from 25 constituencies) for five years unless dissolved sooner. Within the assembly there was set up a 13-member executive council or cabinet led by the premier. The provincial civil service is nonpolitical. Public revenue is drawn in part from subsidies, federal rental of tax fields, gasoline taxes, net revenue from the control of liquor and a variety of licenses.

St. John's is the only incorporated city in Newfoundland. Its affairs are administered by an elected council, which possesses the power of raising local taxes. Outside of 15 organized towns (1949) and 4 rural districts, the traditional functions of local municipal government are exercised by the central authority from St. John's.

Education in Newfoundland is denominational in character. The denominational system reaches far back into the history of the island. The first school in Newfoundland was set up at Bonavista in 1726, by the Society for the Propagation of the Gospel, the Church of England missionary organization. Schools for Roman Catholics were supplied by the Benevolent Irish society, beginning in 1826. It was not until 1836 that government aided education, when a grant of £2,100 was voted. The Education act of 1876 formally recognized the denominational principle by accepting Catholic, Anglican and Methodist schools, and by dividing the government grant to education on a proportional basis. Successive amendments to the act did not substantially alter this arrangement, the appearance of the Salvation Army, Seventh Day Adventists and Pentecostals being marked by schools conducted by those bodies on the same basis as those of the older churches. By 1949 there were also 33 nondenominational schools. All classes of schools are subject to the same regulations, follow the same curriculum and receive provincial grants on the same basis. In St. John's, the larger denominations maintain "colleges" or secondary schools. These represent an investment of about $3,000,000 on the part of the churches. In 1920 a department of education, under the direction of a minister of education, was created. In 1935 the commission of government attempted to consolidate the educational system by appointing a single departmental executive, the secretary for education, who was responsible to the commission. In 1939 another amendment to the Education act replaced this functionary by three denominational officers. Thus, the control exercised by the churches continued unimpaired.

In 1925 Memorial University college at St. John's was opened as a permanent memorial to the Newfoundlanders who served in World War I. In the 1925–50 period the university gave courses in the first two years of the arts and the pure sciences and in the first three years of engineering, provided teacher training and sponsored an active adult educational program. In 1950 the university was expanded into Newfoundland Memorial university with full authority to train students in complete arts and sciences courses.

The International Grenfell association carries on important educational and medical work in the northern outposts and on the Labrador coast. Commenced in 1892 by Sir Wilfred Grenfell, the association maintains a chain of schools and hospitals and an orphanage. The association stresses spiritual as well as physical rehabilitation.

Population.—The population of Newfoundland was 361,416 in 1951 and 263,033 in 1921. Other 1951 population figures: St. John's, 52,873; Corner Brook, 10,276; Wabana, 6,460; Harbour Grace, 2,331; Carbonear, 3,551. The term "outport" is applied to all centres outside St. John's. There are about 1,292 settlements on the island, of which 1,192 have fewer than 500 inhabitants.

The modern Newfoundlanders are the descendants of English, Irish and Channel Islands settlers of the 18th and 19th centuries. About 98% of the people are of British stock. Newfoundland possesses, therefore, a remarkably homogeneous population. Such cleavages as exist are denominational, rather than national or racial or social. Newfoundland is divided numerically almost equally among the Church of England, the Church of Rome and the United Church of Canada. In the chief towns there is considerable overlapping; elsewhere, the various churches monopolize the outports. The churches form the centre of community life, and nowhere in the Anglo-Saxon world does the church play a more decisive part in the lives of the people. The historic fishing industry powerfully influences the distribution of the population. The census figures show that about one-third of the total population is dependent on the fisheries for its livelihood. About one-half lives on the Avalon peninsula, and more than three-quarters on the eastern, or the Atlantic, face of the island.

Population movements in Newfoundland have followed an arresting pattern. The period of immigration lay in the first quarter of the 19th century. Between 1800 and 1850 the population rose from about 15,000 to almost 60,000. This increase seems to have been caused by a remarkable influx from Ireland. Thereafter, immigration declined till by the third quarter of the century it was negligible. Population nearly doubled every generation: 1836, 75,094; 1869, 146,536; 1901, 220,984.

From the beginning of the 20th century, a strong current of emigration set in to the United States and Canada. This exodus is said to have reached the figure of 15,000 a year. Large emigration supplied the normal means of accommodating the rapidly increasing population; it was an emphatic commentary on the small power of absorption of the industries of Newfoundland. But a drive for expanded secondary industries followed confederation, and the effects of that industrial growth on population movements was being watched with interest in the early 1950s.

NEW GLARUS, a town and a village of Green county, Wisconsin, U.S.A., about 26 mi. S.W. of Madison, on the Little Sugar river, a branch of the Rock river. Pop. (1950) 1,224; (1940) 1,068. New Glarus is served by a branch of the Chicago, Milwaukee and St. Paul railway.

It has agricultural and dairying industries, a large milk condensing plant, a stock shipping company and the only Swiss embroidery factory in Wisconsin.

It had its origin in a colonizing experiment made by the canton of Glarus, Switzerland, in 1845.

Two men sent by the canton chose the site of New Glarus largely because the hills and deep valley suggested their Alpine home.

The settlers brought with them a "form of government" drawn up by the cantonal council of Glarus and providing in great detail for a system of schools, for what was practically a State church (Reformed Lutheran) supported by tithes, for a system of poor relief, for a system of courts and for a set of town officers elected on a limited property franchise.

The original plan provided also for an equitable distribution of land to each head of a family. Old world traditions are upheld in

an annual Labor day week end outdoor presentation of Schiller's *Wilhelm Tell.*

NEW GLASGOW, a manufacturing and mining town of Pictou county, N.S., on the East river, 8 mi. from Pictou harbour, and on the Canadian National railway, 104 mi. N.E. of Halifax. Pop. (1951) 9,862. Extensive coal mines are in the vicinity, and there are manufactures of iron and steel, mill machinery, door and sash factories, steel spring and mattress works, blanket and yarn plants, as well as several ship-building yards.

NEW GRANADA (Span. *Nueva Granada*), the title under Spanish colonial administration of that part of South America now known as the republic of Colombia, which at one time was extended to include Venezuela and Ecuador. It also was for a time the title of the united territories of Panamá and Colombia under republican auspices. The Bogotá plateau was invaded from the Caribbean coast and conquered in 1537 by Gonzalo Jiménez de Quesada, who, in honour of his native province, called it the "Nuevo Reino de Granada." In 1550 an *audiencia real* under the viceroyalty of Peru was established at Santa Fé (Bogotá), but in 1564 this isolated group of Spanish settlements was transformed into a presidency. In 1739, owing to the unmanageable size of the viceroyalty of Peru, it was divided and a new viceroyalty was created from the various provinces lying in the northwestern angle of the continent, extending from Tumbez northward to the northern limits of Panamá, and eastward to the Orinoco, to which the name of Nueva Granada was given. The new viceroyalty included the provinces of Tierra Firma (now the republic of Panamá); Maracaibo, Caracas, Cumaná and Guyana (now included in Venezuela); Cartagena, Santa Marta, Rio Hacha, Antioquia, Pamplona, Socorro, Tunja, Santa Fé, Neiva, Mariquita, Popayán and Pasto (now included in Colombia); and Quito, Cuenca and Guayaquil (now included in Ecuador). In 1777 the provinces of Maracaibo, Caracas, Cumaná and Guyana were detached from the viceroyalty to form the captaincy-general of Caracas; otherwise it remained as above until the termination of Spanish rule in South America.

For the republic of Colombia (1819–30), the republic of New Granada (1831–61), the United States of Colombia (1861–86) and the republic of Colombia (1886 to date), *see* COLOMBIA.

NEW GUINEA, island, of estimated area 312,329 sq.m., stretching from the equator in the north-west to 12° 5′ S. in the south-east and from 130° 50′ E. to 151° 30′ E.; separated from Australia by the shallow Torres strait and Arafura sea. On its eastern side lies the Bismarck archipelago. Pop. 1,312,013.

STRUCTURE AND PHYSICAL GEOGRAPHY

The island consists of a long central mountain chain of complex formation, a northern coastal range, and a small planed down hill country on the south coast, west of the mouth of the Fly river, together with the alluvial surfaces formed mainly by the rivers under the influence of equatorial rains. The structure shows, in the west, the influences of great earth movements ranging from the Banda sea. These give arcs (1) Banda islands, (2) Buru, Ceram, West Timorlaut, (3) East Timorlaut, Kei islands, coastal mountains of south-west New Guinea from the Baik mountains to Cape Fatingar, thence via Misol island, Obi island, and then north on the west side of Halmahera. This curve is separated, in West New Guinea, from the central chain by the deep McCluer inlet. The central chain stretches from northwest to southeast. In Dutch New Guinea the name Nassau mountains is applied to the chain as a whole.

In this chain the snow line is to be found approximately at 14,600 ft. and Mt. Idenburg (15,748 ft.) and Mt. Carstensz (16,404 ft.) have glaciers. The next section is the Orange mts. with Mt. Wilhelmina (15,584 ft.). There seems to be a more or less parallel range 25–45 mi. to the north of this succession of ranges, and in it a height of 12,500 ft. has been observed in the Weijland mountains. The composite nature of the great chain is maintained eastwards and it is believed that the main watershed lies in the Mandated and not in the British territory. In the former a height of 13,700 ft. has been found in the Otto mts.; on the south flank the chain grades into a complex of mountains of lesser height. The southeastern part of the chain called the Owen Stanley range (Mt. Albert Edward, 13,222 ft.) declines gradually to the end of the long peninsula.

Towards the west the central chain is formed principally of palaeozoic sandstones and slates on which much younger rocks, nummulitic sandstone and limestone are laid. In Dutch New Guinea, the lower mountain country is of Miocene rock. Towards the south-eastern peninsula there are again old rocks, some with gold-bearing quartz, especially along the axis, as well as granite and folded Tertiary limestone on both coasts of the peninsula; here also, and in the d'Entrecasteaux islands is much evidence of volcanic activity (Miocene, Pliocene, Pleistocene and recent).

The northern coastal range in Dutch New Guinea is said to reach a height of about 6,900 ft.; it declines towards the mouth of the Sepik, beyond which it rises again to a height of about 10,500 ft. and ends at King William's cape. It is formed of ancient elements with diorites, gabbro, andesites, etc., mostly covered with Tertiary and even possibly younger sediments, and is probably still in process of uplift; recent coral reefs adorn some cliff sides and may reach a level of some 5,500 feet. There is abundant evidence in New Guinea of large earth movements from Miocene times onwards, with a probable maximum in the Pliocene or Pleistocene. The southern hills between the mouths of Digul and Fly rivers are an extension of Australia structurally. Between these lines of hills there run lowlands, floored near the Idenburg river by Pliocene sandstones.

The most important rivers are the Mamberamo, reaching the sea north of the Nassau range; the Sepik, also on the north, navigable by seagoing steamers for 180 m.; the Fly river flowing into the Gulf of Papua, navigable by a whale boat for 600 miles; and the Digul in the south-west. Many of the rivers have gold, but it is important in few places save the Louisiade archipelago beyond the south-east extremity and Woodlark island. Murua (Woodlark island) beyond the d'Entrecasteaux islands has banded quartzite much valued for making adzes. Petroleum occurs near the coast of the Gulf of Papua and in the so-called Bird's Head.

Climate.—In the northern summer the south-east trades dominate New Guinea; they bring rain to the south-east peninsula but the rain diminishes farther west on the south side as the wind is affected more and more by the passage across the corner of Australia. Northward on the east coast the rain at this season appears to be very heavy where the land faces south-east. Farther west there is little rain while the south-east trades blow. In the southern summer, New Guinea is on the wind-path from Asia, round to the very marked Australian low pressure centre. The wind is swinging round from the north-west to north-easterly direction and it brings heavy rain to northern New Guinea and to the southern part of the Dutch Territory. In one place in the rain shadow of the northerly mountains an annual rainfall of 96 in. has been measured, but on the exposed heights, especially between 3,000 and 6,500 ft., it must be enormously greater. In the lowlands the convection currents rule all the year round, but the amount of rain varies. The temperature remains near the average of about 81° declining to about 72° and rising to about 92° as rough monthly averages. 72° is not far from the average morning, and 92° not much above the average noon, temperatures.

Flora and Fauna.—The general vegetation is that of the rain-forest, but under the conditions of great heat the rain-forest cannot grow where there is a long dry season. The tree limit is more than 10,500 ft. above sea-level. Towards the mountain tops one finds European (*Rubus, Ranunculus, Leontodon, Aspidium*), Himalayan, New Zealand (*Veronica*), South American (*Drymus, Libocedrus*) and even Antarctic species. From 6,000 ft. upwards fine Agapetes (*Ericaceae*), pines (*Araucaria, Libocedrus*) and palms adapted to hill-life abound. In the lower lands palms are very abundant, and along the tidal courses of rivers those of the genus *Nipa* are common; sago palms are numerous in the seasonal swamps while grass and cane swamps occur where the land remains long under water. On the Alang steppe is the tall, tough grass, *Imperata arundinacea.*

New Guinea was probably united to Australia as recently as Pleistocene times, whereas its last effective connections farther

west are much older. It thus belongs in the main to the Australian region with nine species of Echidna (*Monotremata*) and 84 of marsupials among which are two genera peculiar to the island (*Distoechurus* and *Dorcopsis*). Small kangaroos live on the borders of steppe and forest in the higher lands. Bats abound and there is a pig (*Sus papuensis*), a dingo and 50 indigenous species of rats and mice chiefly on the steppe, and a few squirrels. The bird fauna includes well over 500 species and at least 50 genera are peculiar to the island. Birds of prey hover over the steppe and catch rats and mice, but apparently they avoid the great forests and here flourish the famed birds of paradise, which are absent from all the islands east of New Guinea. The Bismarck islands have birds allied to those of New Guinea but 74 species are peculiar to them. Turtles and tortoises are plentiful on the coast and have curious relationships with South American forms; many lizard species are peculiar to the island but comparatively few snakes. Amphibia are abundant and of Australian affinities. Insects are very numerous and the butterflies are gorgeous. Land molluscs are related to those of India and Malaya.

POLITICAL DIVISIONS

British New Guinea (TERRITORY OF PAPUA).—Area about 90,540 sq.mi., European population 1,822. Natives estimated 337,000. A British protectorate was declared in 1884 after the government of Queensland had annexed the land in 1883, and after various changes it became (1906) the Territory of Papua under the governor-general of Australia, with a lieutenant-governor of its own. An executive council of one unofficial and eight official nominees helps the lieutenant-governor and also forms part of the legislative council, which has five additional unofficial nominees. There are eight magisterial districts and a central court at Port Moresby, and an appeal thence to the high court of the commonwealth. Some simple regulations of native government are administered with the help of village constables. About 190,000 ac. of land have been leased, chiefly by planters, and over 62,000 are cultivated, chiefly for coco-nuts, rubber and sisal.

(A. C. H.; X.)

Mandated Territory of New Guinea.—The northern section of south-east New Guinea (formerly called Kaiser Wilhelmsland) was mandated in 1919 by the League of Nations to the government of the Commonwealth of Australia, together with the Bismarck archipelago (New Britain, New Ireland, and adjacent islands), the Admiralty islands and several outlying groups, and the northern Solomon islands (Bougainville and Buka). North-eastern New Guinea lies between 2° 15′ and 8° S., and 141° 30′ and 148° E. It had been declared a German protectorate in 1884 when not a single white man lived there. Plantations arose in the islands and on the mainland, and three German mission societies soon formed settlements in New Guinea. Under the mandate, the system of indirect rule through native chiefs has been continued. The administrator advises the governor-general of Australia who can legislate by ordinance. There are ten district officers, six of whom are in the islands. The headquarters is at Rabaul. No slavery or forced labour is permitted, but natives are not allowed to leave the territory, and labour indentures are made. No one may supply natives with firearms, ammunition, alcoholic liquor, opium or derivatives of opium.

The total native population was estimated at 581,342 (1938), excluding territories not yet under control and also excluding 41,849 indentured labourers. Of the above population *c.* 250,000 are on the mainland. The non-native elements number 6,283 including 1,737 Chinese, 3,472 British and 473 Germans. The area of the mainland mandated territory is 68,500 sq.mi.; pop. (1940 est.) 675,389. Products include coconuts, cacao, rubber and cotton.

Both Papua and the mandated territory of New Guinea were battlefields between Japan and Australian-U.S. forces in World War II. The initial Japanese penetration into the area occurred Jan. 23, 1942, when landings were effected on New Britain and New Ireland, and in the Solomons. On the following March 8, a Japanese convoy landed forces at Salamaua and Lae on the northeast coast of New Guinea. Still later, troops landed at Buna and Gona, tiny shore points in northern Papua. The Japanese then began a concerted drive southward across the Owen Stanley mountains toward Port Moresby. By Sept. 1942 they had passed the crest of the range, taken Kokoda and Kagi, and were threatening Port Moresby, key to the invasion of Australia. They were driven back by an Allied counterattack, Sept. 25. Thereafter, the Allies drove first toward the north coast and then westward along this shoreline until they reached the tip of the island at Sansapor by Aug. 1, 1944. With the Japanese surrender on Sept. 2, 1945, the island was restored to its former owners. (*See* WORLD WAR II.)

BIBLIOGRAPHY.—*Official Handbook of the Territory of New Guinea, etc.* (Canberra, n.d., 1937?).

Dutch New Guinea.—Dutch New Guinea, which lies between 10° S. and the equator, comprises practically half of the entire island of New Guinea. The boundary line between it and British New Guinea starts from the south coast and follows the line 141° E. up to the Fly river, which river then forms the boundary until 141° E. is reached, when the meridian becomes the boundary again, right up to the north coast. The area is 151,789 sq.mi., and the population is estimated at 350,000, of whom 310 are Europeans or Eurasians. The territory is practically undeveloped; save for the extreme western coastal portion opposite Ceram, and parts of the northern coast, its coasts are imperfectly charted, and large stretches in the interior are only superficially explored. The northern half is mainly hilly, with a very high range of mountains traversing it east by west, though along the northern coast and on either side of the Mamberamo river, which flows into the sea at Cape d'Urville, are great alluvial tracts of land; the extreme west is almost wholly hilly; the south very flat, with vast swamps near the coast, especially in the south-west, where Prince Frederick Henry island, separated from the mainland by the narrow and tortuous Princess Marianne strait, is perfectly flat and marshy, and covered with dense forest. Into McCluer gulf (Teluk Berau), which divides the western portion of Dutch New Guinea almost into two, flow several rivers, including the Seljar and Ketero, the former navigable, for small vessels, for 34 and the latter for 23 miles. Along the south-western coast stretch, in succession, from north to south, the Mimika, Utakwa, North-West river, Lorentz, Utumbuwe, Eilanden, Digul and Merauke. Some of these are situated so close to each other that they are connected by channels navigable for small, light-draught boats, several are navigable for distances of from 25 to 50 mi. for steamers of 12 ft. draught, and the Digul the largest, is 6 mi. wide at its mouth and has been ascended for nearly 400 mi. by a steamer of 6 ft. draught. The south-western coast is flat and fairly even, until the Charles Louis mts. are reached, where it becomes high and much indented. Flat tracts alternate with high ground along the western coast, very much indented after McCluer gulf, and the north coast, from Cape Sorong along Little Geelvink bay, to the middle of the coastline of Great Geelvink bay, is generally high, especially where, near Manokwari, the Arfak mts. come very near to the sea. The remaining shores of Geelvink bay, to Cape d'Urville, and beyond, as far as Sarmi point, are low, flat and alluvial, but from here to Humboldt bay it is mostly high, rugged and rocky. The entrance to Great Geelvink bay is blocked by several islands, the northernmost being the Schouten group, Suk, or Supiori, to the west, and Biak, or Wiak, to the east. The former is 17 mi. long and has hills reaching 1,600 ft.; the latter is 45 mi. long and 23 mi. wide, with a hill 800 ft. high at the southern end, otherwise it is only 50 ft., above sea-level. Farther within the bay is the important island of Jobi, or Jappen, 110 mi. long and 15 wide, with a ridge of mountains 2,500 ft. high running along the centre, the south coast being indented with deep creeks, fronted by wooded islets and reefs. Between Ceram and the north-west coast of Dutch New Guinea lies Misol, 50 mi. long and 23 broad (narrow in the west, wide in the east), with numbers of very small islands to the north and south of it. It is flat in the north and hilly in the south, no point being over 1,800 ft., the coast is rocky, but swampy in places, and there are three rivers, navigable for a few miles. Separated from the north-west coast by the narrow Galewo straits is Salwatti, a round island, 30 mi. across, with regular coasts, and limestone hills on the north coast, 1,000 ft. high, but low and swampy in the east, and no rivers of

note: east of Salwatti is the small island of Popa. North of Salwatti, separated by Pitt strait, is Batanta, 40 mi. long and only from 4 to 8 mi. wide, densely wooded and mountainous (highest point 3,676 ft.). Due north of Batanta is the island of Waigiou, 28 mi. wide, nearly 80 in length, and separated from New Guinea by Dampier strait, 30 mi. in width. It is covered with forest.

Commerce and industry in Dutch New Guinea are almost unknown. The people generally live in a very wild state, head-hunting and cannibalism are all too prevalent; some are semi-nomadic, others entirely, and as they live largely on sago, and this is obtainable almost everywhere, in large quantities, with a minimum amount of labour, while the coconut abounds, and the sweet potato, sugar-cane, plaintain, papaya and tobacco are grown with little trouble, there is no incentive to work, apart from hunting the cassowary, pig and kangaroo, for their flesh, and fishing, the only lucrative employments followed being those of hunting the bird of paradise, collecting the wild nutmeg, the mace of which is much esteemed and marketed specially in Macassar, and the preparation of copra. Men and women go about almost entirely naked, the men armed with bow and arrow, axes of polished stone, and daggers of the jaw-bone of a crocodile or the thigh-bone of a cassowary. There are head men of villages, but they have little power, the people of the coast are often at war with those of the scrub lands of the interior, and there is enmity between these and the mountain folk: language varies considerably. There are no extensive roads.

In the whole of South New Guinea there is only one settlement, Merauke, a few miles inland up the Merauke river. A Dutch *Gezaghebber* resides here, there is a small garrison, a hospital, Catholic mission church, and settlement, and a few shops, mostly run by Chinese traders, a wireless station, and a small wharf, where vessels of the Dutch Royal Packet company land passengers and collect copra and other cargo. Merauke was established in 1902, as the result of a military expedition. The nearest Dutch settlement to Merauke is at Kaimana, on the McCluer gulf, 500 mi. distant. Here, and at Kokas and Fak Fak (headquarters for West New Guinea, where there is a *Gezaghebber*), there are small trading stations with Malay, Chinese and Arab settlers; Fak Fak is the most important, where proximity to Ceram and generations of outside influence have resulted in settled and semi-civilized conditions among some of the Papuans. All three places are ports of call for vessels of the Dutch Royal Packet company, also Sorong, on the northwest coast, opposite Salwatti, and Manokwari (Doreh), on the northeast coast, which is the seat of an assistant resident and the headquarters of administration for North New Guinea. Wasior, on Little Geelvink bay, is another port of call, also Sarmi, Demta, Hollandia and Humboldts bay, and here, too, are Chinese and Malay traders, dealing mostly in copra and bird of paradise plumes, and there is some exploitation of the hinterland. The development of Dutch New Guinea will probably be more rapid than that of North New Guinea, for there is good land available and more chance of being able to utilize imported labour, when this can be procured. Trade is being developed with Jappen island, where Dutch Royal Packet vessels call at two ports, Seroei and Wooibaai; and with Biak, of the Schouten islands, the port of which is Bosnik.

A treaty dated 1660 between the Dutch East India company and the three states of Ternate, Tidore and Bachian, acknowledged the company to be "lord of the Papuans or all their islands which are subject to the king of Tidore." This gave the Dutch a nominal sovereignty over the Tidorese fiefs on the islands of Waigiou, Salwatti and Misol, and as on the latter two islands there were kingdoms possessing a vague sovereignty over parts of the mainland of New Guinea, while the suzerainty of Tidore was acknowledged in the neighbourhood of McCluer gulf, eventually the Dutch succeeded to these somewhat shadowy rights. Their first establishment was in 1828, when Fort de Bus was erected, but before this, in 1814, Dutch sovereignty in North-West New Guinea had been admitted, practically, by Great Britain by the convention of 1814, which restored to the Dutch their colonies as they had existed prior to 1803. In 1828 the Dutch government declared North-West New Guinea, as a dependency of Tidore, a part of the Dutch East Indian colonies, which claim was confirmed in 1848, the frontier then being stated to run straight from Cape Bonpland to the north coast. In 1884, when South-East New Guinea was declared a British protectorate, the meridian of 141° E. was acknowledged as the frontier between British and Dutch territory, and later, in 1885, the same meridian was accepted by the Dutch as defining the frontier of German New Guinea. A convention entered into by Holland and Great Britain in 1895 made a slight alteration in the boundary (the Fly river) and made the navigation of the Fly river free to subjects of both powers, except for the carriage of munitions of war. In 1898 Tidorese territory was assigned to the Ternate residency, in 1911 West New Guinea was attached to the Residency of Amboyna. The division of territory is North New Guinea, West New Guinea, and South-West New Guinea, all three being parts of the residency of the Moluccas. The coastline of Dutch New Guinea except for the southeastern part was conquered by the Japanese in World War II. (E. E. L.; X.)

ANTHROPOLOGY

The island of New Guinea and its island-clusters, together with those adjacent island-groups, of which the principal are the Louisiades and the Torres Straits islands, is a region of considerable racial and cultural diversity. The territory of New Guinea, the north-eastern quarter of the island, is, however, still very incompletely surveyed ethnologically, and of the inhabitants of Dutch New Guinea, our knowledge is comparatively slight.

Racial History.—Although there is considerable variety of racial type, the inhabitants of New Guinea belong almost entirely to the ulotrichous (frizzy-haired) branch of mankind. The principal varieties are the Negritos, the Papuans and the Melanesians. The only typical Negritos that have been found in New Guinea are the Tapiro at the source of the Mimika river in the Snow mountains of Dutch New Guinea, and the Pesechem. The Mafulu, the Kai and some others have probably a Negrito element.

The Papuan, the dominant stock in New Guinea, is dark, of short stature and generally long-headed. Evidently, Papuan man occupied not only New Guinea, but also Melanesia in very early times (*see* OCEANIA: *Racial History*), later migrations from Indonesia having on the whole less racial than cultural effects. The Melanesian element in New Guinea is certainly comparatively recent, and appears to be a mixture of Papuan with Indonesian and proto-Malay, a mixture which may in part have taken place in Indonesia. The Melanesian influence is strongest in the north and north-eastern coastal regions; and on the south-east coast of Papua the immigrant nature of this Melanesian type is clear.

Principal Groups.—Taking the whole New Guinea area, and

working from west to east, some of the principal culture-areas (or tribes where these exist) may be enumerated. Belonging to New Guinea rather than Australia we have the islands of Torres Straits with a well-developed and distinctive culture. Two groups on the mainland between the Fly and the Dutch boundary may be mentioned, the Tugeri, partly in British but mainly in Dutch territory where they are known as Marind-Anim (their name for themselves) and the Kiwais. A culture of which little is known occurs in the neighbourhood of Lake Murray, between the Strickland and the Fly; and between the Fly and the Aramia, we have a tribe, the Gogodara, containing many distinctive characters. In the Gulf of Papua, from a little west of the Kikori river to Cape Possession, four main groups are distinguished by Dr. Haddon, Kerewa, Urama, Namau and Elema, and far from the coast on the upper waters of the St. Joseph river the Mafulu show distinctive characters, physically and culturally. To the east of these Papuan districts we meet the farthest westward extension of Melanesian-speaking peoples. There are two main groups of these Papuo-Melanesians, the Western Papuo-Melanesians, the Roro, Mekeo, Motu and others, and the eastern Papuo-Melanesians or Massim, inhabiting the eastern extremity of New Guinea and the islands beyond, including the whole of the Louisiades, except possibly the island of Rossel, the inhabitants of which speak a non-Melanesian language. Passing westward along the north coast, Melanesian-speaking peoples give way for a while to Papuan-speaking peoples, such as the Orokaiva.

In the territory of New Guinea (excluding the Bismarck Archipelago, *q.v.*), the Bukaua, Huon gulf and the adjoining Jabim are Melanesian in culture, while the Tami of the neighbouring islands seem to be fairly pure Melanesian. Farther north the Kai, who inhabit the Rawlinson and Sattelberg ranges, are Papuan with Pygmy admixture. Both Papuan-speaking and Melanesian-speaking peoples occur along the coast farther north and west. Flourishing cultures occur on the Sepik river, and something is known of the Banaro on the Keran river.

In Dutch New Guinea something is known of the Geelvink bay district, where Melanesian-speaking peoples occur. On the west coast we find Papuans on the Mimika river, and at the headwaters of this river are the Tapiro pygmies.

Mode of Life.—With very few exceptions the inhabitants of New Guinea are horticulturists, cultivating coconuts, yams, taro, bananas and a number of other food plants. Sago is also an important food in some parts, constituting the main article of diet in the swampy region of western Papua. Fish are caught by net and spear, and occasionally by hook; and the harpooning of the dugong is an important feature amongst certain of the coastal peoples. The pig, domesticated and wild, is the only important flesh-food, though the wallaby and many birds are caught by various devices. Betel-nut is chewed with lime and pepper-plant, and the use of tobacco is now universal. Kava, the Polynesian drug, is limited to one or two places. Family houses are usually small, and are often built on piles. They may be scattered, as amongst the Massim, or grouped in big villages, as amongst the Motu and Gulf peoples. Club-houses in which initiated males live most of their lives occur in many parts and may be of considerable size; structures of this kind which entail enormous labour occur on the Sepik and in the Papuan gulf. Canoes are simple dugouts, or provided with an outrigger. Double canoes occur amongst the western Papuo-Melanesians. The Motu, joining several canoes together, make vessels of considerable size. For clothing the men usually wear some sort of girdle, and the women a petticoat of shredded palm; the Papuans of the north-west coast of Papua clothe the waist with tapa-cloth. Armlets of cane or of shell are common; necklaces of shell, dogs' teeth or seeds. The septum of the nose is commonly pierced to admit a nose-stick, usually of clam-shell, and the lobes of the ear are pierced and decorated in the east with turtle-shell rings and sapi-sapi beads. Tattooing has an irregular distribution, being confined to women in the case of the Massim, who are tattooed from forehead to thighs. Considerable artistic skill is shown, particularly by the Melanesian-speaking inhabitants, the carved and fretted woodwork of the Massim being of unusual excellence. Pottery is in general use among the Melanesian-speaking peoples. The drum is the commonest musical instrument, though absent from Rossel island in the Louisiades. Slit wooden gongs, with a most limited distribution, are found north of Huon gulf, in the territory of New Guinea, and in Dutch New Guinea. With these gongs are associated sacred flutes, which, however, are also found in the northern division of Papua.

Social Organization.—Although the family (*q.v.*) is an important unit in the social structure of all New Guinea peoples, a wider group, the clan (*q.v.*), seems in general to be more fundamental. Moreover, family relationships are not usually distinguished by name from many more remote relationships, and relationship terms used between persons who can trace genealogical relationship are also used in a systematic way between persons who are unable to trace any genealogical connection. This system, known as the classificatory system, takes a variety of forms in New Guinea, and social organization is unintelligible without an understanding of this system. Within the clan the classificatory system establishes a comparatively small number of relationships, and in general members of the same generation within a clan address one another as brothers and sisters, and the tie uniting members of one clan will be found to be similar to that uniting brothers and sisters by one father or mother. Both matrilineal clans (membership of which is determined by descent through the mother), and patrilineal clans (membership of which is determined by descent through the father), are found in New Guinea. The principal matrilineal area is the Massim district of Papua, and in this area the clans are totemic. (*See* TOTEMISM.) Each clan is associated with four linked totems, bird, plant, fish and snake, and the bird-totem is not eaten by members of the clan. A person will also avoid the bird-totem of his father's clan, the totems of which are necessarily different, since the rule of clan-exogamy (marrying out of the clan) is strictly observed. Amongst the patrilineal Papuans of the west, the clan seems to become of rather less importance, and totemism occurs only in an attenuated form in the Gulf region.

In the east the clan figures as the important unit in the rituals of marriage and death, and the series of feasts more or less connected with these events, which play a dominant part in the life of the Massim. Reciprocal exchanges of pigs and objects of value between persons more or less representative of clans is an important part of all such activities, as in the Big Feast which extends from the Massim as far as the Mafulu. This reciprocity between clans was also shown in warfare, cannibalism being a ceremonial act of revenge on the part of one clan for the death of one of its members by another clan.

In the social organization of the Papuans of the west, as well as the Papuans of the northern division, and the Jabim, Bukaua, Tami islanders and others in the territory of New Guinea, the outstanding feature is the existence of tribal initiation-ceremonies. The Elema tribes commence this initiation of the males at about the age of eight, when the boy is first taken into the club-house of the village and shown the bullroarer, the noise of which has previously been a mystery to him. Only after two or three years is his initiation complete, and the process involves not only various ordeals and instruction for the initiates, but a great deal of ceremonial in which the whole of the village, and maybe other villages, are involved. In other initiation rites the swallowing of novices by a monster and subsequent resurrection is prominent, this occurring both amongst the extreme western tribes of Papua and in the Huon peninsular district of the territory of New Guinea.

Religion.—A cult of the dead occurs throughout New Guinea, and only rarely is a cult of gods associated with it. The Big Feast of eastern Papua is to a large extent a collective celebration of the dead, though in the Soi feast of the Massim a being is continually addressed, who is not strictly an ancestor, and is supposed to have performed supernatural feats in olden times, and to have introduced the pig into New Guinea. This being is related to a number of other superhuman beings who lived in the past, but they can hardly be regarded as objects of a religious cult. On Rossel island, on the other hand, at the extreme east of the Massim area, we find an elaborate god-cult and constant care of the gods, who control the processes of nature by a priesthood.

The religion of the Elema tribes in the west of Papua may be described as an ancestor-cult, the name for ancestor being the same as that for all sacred objects; but some of these ancestors are regarded as deities who temporarily assumed a human form, giving birth to various tribes.

That death results from sorcery or is brought about by ghosts is probably a universal belief in New Guinea. The magic employed by sorcerers for this end is usually of the sympathetic type, some part of the victim being utilized by the sorcerer, or some imitative action being made to the accompaniment of a spell. Divination is also common, and where it is believed that ghosts may cause sickness divination is used to discover whether a ghost or sorcerer is responsible. On Rossel island an alternative cause of death is the desecration of the sacred ground of a god. (W. E. A.)

HISTORY

Exploration.—Although New Guinea may have been seen by Antonio d'Abreu in 1511, its first visitor was apparently Dom Jorge de Meneses, who in 1526 took shelter at "Isla de Versija," either Warsia on the north coast, or Waigiu island. Two years later Alvaro de Saavedra discovered "Isla de Oro," probably one of the Schouten islands, and sailed along the north coast. The name "Nova Guinea" is due to Ynigo Ortiz de Retez (or Rotha) who landed on the north coast in 1546, and thought the natives resembled those of West Africa. The chart of Ortelius (1580) shows "Nova Guinea" as an island seventeen years before the fact was proved by Luis Vas de Torres sailing through the straits now bearing his name.

Dutch navigators, Willem Jansz (1605), Jacques le Maire and Willem Schouten (1616), Jan Carstensz (1623), Gerrit Pool (1636), Abel Tasman and others, appeared after the conquest of the Moluccas. In 1700 William Dampier sailed along the northern coast, and Philip Carteret (1767) and L. A. de Bougainville explored the islands. James Cook re-discovered Torres Straits, and landed in New Guinea near Prince Frederick Henry island (1770). Thomas Forrest (1774) wrote an interesting account of the island (*Voyage*, 1780). Although parts of the coast were surveyed by La Perouse (1788), John MacCluer (1790), D'Entrecasteaux (1793, *Voyage* by Rossel), and also by Duperrey (1823), D. H. Kolff (1826), and Dumont d'Urville (1828), very little knowledge was gained of the country or people.

The Papuan Gulf and shores eastward were visited by F. P. Blackwood (1842–6, *Voyage of the Fly*, by J. B. Jukes), Owen Stanley (1846–50, *Voyage of the Rattlesnake*, by J. Macgillivray), Charles B. Yule (1864) and J. Moresby (1874). In 1875 Schleinitz explored the north coast and islands. During this period scientific observers visited the islands, notably A. R. Wallace (1858), Odoardo Beccari (1871–76), Maria d'Albertis (1871–78), C. B. H. Rosenberg (1869–70, *Bijdragen*, 1875), and Nicholas von Miklucho-Maclay (1871–81). Expeditions were made for the Netherlands India Government by P. van der Crab, E. Teysmann, J. G. Coorengel, A. J. Langeveldt van Hemert and P. Swaan (*Bijdragen*, 1879). Missionaries of the Utrecht Missionary society were at Port Dorey in 1858, and English missionaries have resided in the south-east since 1871. Of these, Samuel Macfarlane (1875), James Chalmers (1877–1901), and George Brown (1875–1897) have described both country and people. Otto Finsch (1882), and Theodore Bevan (1884–87) explored the southern rivers. Since the annexations, explorers and observers have been constantly at work. During and since the administration of Sir William MacGregor (1888–98), large areas of British territory were surveyed, and the natives pacified by a system of patrols (*Annual Reports*). The island was first crossed in 1897. James Chalmers was murdered in 1901. The anthropology has been made known by C. G. Seligman, V. M. Egidi, W. Mersh Strong, R. W. Williamson, B. Malinowski, W. J. Saville, E. B. Riley, G. Landtman, J. H. Holmes, A. C. Haddon and others. In 1922 Leo Austen ascended the Fly river to the Netherlands boundary.

In German territory the Sepik (Kaiserin Augusta) river was visited by Otto Finsch (1885) and the Ramu river by Schleinitz (1887). In 1893 O. Ehlers and N. Piering lost their lives in crossing the island. Other explorations were carried out by C. Lauterbach (1896), Poch (1904), Heine (1908), Full and Friederici (1908). The northern part of Netherlands territory was explored by C. E. A. Wichman, G. A. J. van de Sande, and H. A. Lorentz (1903) and the south by Lorentz (1909–*Nova Guinea* by A. Wichman). South-west New Guinea has been explored (*Netherlands Geographical Society* 1908) and Central New Guinea in 1920 (H. J. T. Bijlers, 1923). In the 1930s a number of expeditions explored the interior (*e.g.*, R. Archbold).

Annexations.—In 1793 New Guinea was annexed by the (English) East India company, who placed a garrison for some time on Manuswari island in Geelvink bay. As suzerain of the sultan of Tidore the Dutch (after 1848), claimed control over the northern coast as far as Humboldt bay. In 1828 they established a fort in Triton bay and took possession of the south-west coast as far as the 141st meridian. Their claim to the western half of the island was admitted by Britain and Germany in 1885. In 1905 the sultan of Tidore ceded his rights to the government.

In 1864 Yule annexed the south coast for the British crown, and Moresby in 1873 took possession of the islands of Eastern New Guinea. The possible dangers to the commerce of Queensland and Australia generally, should the island come into the possession of a foreign power, led to a demand for annexation. The Germans in 1882 having advised their government to annex, the Queensland government in 1883 actually annexed all the mainland opposite their shores and east of the 141st meridian, but, as with the annexations of Yule and Moresby, this action was disavowed by the home government. In 1884 Germany annexed the north-east coast and adjacent islands, and Commodore Erskine proclaimed a British protectorate over the region east of the 141st meridian as far as East cape and the islands to Kosmann island. In 1885 the German New Guinea company was chartered to acquire and occupy those portions of the island not under British or Dutch sovereignty, the mainland being styled Kaiser Wilhelmsland, and the islands the Bismarck archipel. A boundary agreement was made in the same year, the British territory being named British New Guinea. In 1888 the protectorate became a dependency controlled by Queensland and in 1906 was renamed the Territory of Papua. In 1889 the German New Guinea company surrendered their charter. After the capitulations in 1914, the German territory was occupied by an Australian administration. As the Territory of New Guinea, it passed to Australia under mandate from the League of Nations. (See *Political Divisions*, above, for World War II; *see also* WORLD WAR II.)

BIBLIOGRAPHY.—Accounts of voyages published under the explorers' names are not noted here. A few others are mentioned in the text. Many Dutch expeditions are described in the *Bijdragen tot de taal-land-en volkenkunde van Nederl. Indië*, and Tijdschrift Kon. Aardrijkskundig Genootschap. German explorations are recorded in *Nachrichten über Kaiser Wilhelmsland*. English surveys will be found in *Annual Reports on British New Guinea (and Papua)*. Other works are: A. Dalrymple, *Historical Collection* (1770–71); Burney, *Chronological History* (1803); Meyners d' Estree, *La Papouasie* (Paris, 1881).

NEW HAMPSHIRE, popularly known as the "Granite state," is one of the New England group of the United States of America and one of the original 13. The state lies between approximately 42° 40′ and 45° 18′ N., and between 70° 37′ and 72° 37′ W. It is bounded north by the Canadian province of Quebec; east by Maine, by the Salmon Falls river, which separates it in part from Maine and by the Atlantic ocean; southeast and south by Massachusetts; west and northwest by Vermont (from which it is separated by the Connecticut river—the low water mark on the west bank of the Connecticut is New Hampshire's west boundary), and by Halls stream which separates it from Quebec. The state has an area of 9,304 sq.mi., of which 287 sq.mi. are water surface.

Physical Features.—In the north central portion of the state, the White mountains, a continuation of the Appalachian system, rise abruptly in several short ranges and in outlying mountain masses from a base level of 700 to 1,500 ft. The highest, Mt. Washington, attains an elevation of 6,288 ft. The principal ranges, the Presidential, the Franconia and the Carter-Moriah, have a northeastern and southwestern trend. The Presidential, in the northeastern part of the region, is separated from the Franconia on the southwest by the Crawford or White Mountain notch, about 2,000 ft. in depth, in which the Ammonoosuc and Saco rivers find a passage, and from the Carter-Moriah, parallel to it on the east, by the Glen-Ellis and Peabody rivers, the former noted for its beautiful falls. On the Presidential range, which is about 20 mi. in length, are Mount Washington and nine other peaks exceeding 5,000 ft. in height. On the Franconia, a much shorter range, are Mount Lafayette, 5,269 ft.; Mount Lincoln, 5,098 ft.; and four others exceeding 4,000 ft. The highest peak on the Carter-Moriah range is Carter Dome, 4,860 ft.; but seven others exceed 4,000 ft. Separating Franconia and Pemigewasset ranges is the romantic Franconia notch, overlooking which from the upper cliffs of Profile mountain is the Great Stone Face, immortalized by Nathaniel Hawthorne.

The part of the state which lies north of the White mountains is occupied by ridges and wide rolling valleys, the ridges rising occasionally to heights of 2,000 ft. or more. South of the mountains a plateaulike surface—a part of the New England uplands—extends from the intervales of the Connecticut river to the eastern border of the Merrimack valley. Between the Merrimack valley and the sea is the only low surface in the state; a considerable portion of this region is less than 500 ft. above the sea. The seashore, about 18 mi. in length, is mainly a low sandy beach. The only harbour is at Portsmouth near the mouth of the Piscataqua. About 9 mi. from the shore are the bleak and nearly barren Isles of Shoals, divided between New Hampshire and Maine.

The lakes and ponds, numbering several hundred, were formed by glacial action; and the scenery of many of them is scarcely less attractive than that of the mountains. The largest and most widely known is Lake Winnipesaukee, 20 mi. long and from 1 to 8 mi. wide, dotted by 274 islands, mostly verdant. It has clear water and a rather level shore, behind which hills or mountains rise on all sides. The rivers with their numerous falls and the lakes with their high altitudes furnish a vast amount of water power for manufacturing—the Merrimack, in particular, into which many of the larger lakes, including Winnipesaukee, find an outlet.

Fertile soil in New Hampshire is confined largely to the bottomlands of the Merrimack and Connecticut rivers. In the southeastern section is also a moderately productive soil derived largely from the disintegration of slate. Elsewhere south of the mountains, the surface soil is mostly hardpan or till, this being deepest on the drumlins. In the mountain region the soil is mostly a sandy loam composed of disintegrated granite gneiss and organic matter; on the lower and more gentle slopes as well as in the valleys this is generally deep enough for a luxuriant vegetable growth but on the steeper slopes it is thin or the rocks are bare.

Climate.—The winters are usually long and severe, and the summers cool and fine. The mean annual temperature ranges from about 42° F. at only moderate elevations in the White mountain region and farther north to 47° at low altitudes in the southeast. The greatest extremes of temperature occur in the deep mountain valleys where it sometimes rises to 102° or above, in summer, and falls to −38° or below in winter; higher up on the mountains it is never so warm and along the seacoast both extremes are considerably less. The mean precipitation for the entire state is about 40 in. The distribution is even throughout the year, but summer and autumn are slightly more wet than winter and spring. Among the mountains and in the northern part of the state the annual fall of snow is from 7 to 8 ft., but in the southeast corner it is little more than one-half that amount. The prevailing winds are generally northwest, but in the vicinity of the sea they are southeast during summer.

History.—Martin Pring was at the mouth of the Piscataqua in 1603 and, returning to England in the same year, gave an account of the New England coast from Casco bay to Cape Cod bay. Samuel de Champlain discovered the Isles of Shoals and sailed along the New Hampshire coast in 1605, and much more information concerning this part of the new world was gathered in 1614 by Capt. John Smith, who in his *Description of New England* refers to the convenient harbour at the mouth of the Piscataqua and praises the country back from the rocky shore. Under the leadership of Sir Ferdinando Gorges there was formed in 1620 the Council for New England, which procured from King James I a grant of all the country from sea to sea between 40° and 48° N. lat., and which made nine grants bearing upon the history of New Hampshire. The first of these grants was to John Mason, who has been called "the founder of New Hampshire," on March 9, 1622. The name New Hampshire was first applied to a grant which lay between the Merrimack and Piscataqua, and given to John Mason on Nov. 7, 1629. The first settlement of which there is indisputable evidence was established in 1623 by David Thomson at Little harbour, now in the town of Rye. Thomson was the head of a company which was organized for fishing and trading and whose entire stock was to be held jointly for five years. He built a house on Odiorne's point overlooking Little harbour, and, although he moved to an island in Boston harbour in 1626, he may have continued to superintend the business of the company until the expiration of the five-year term. At least there was a settlement here which was assessed in 1628, and it may not have been completely abandoned when colonists sent over by the Laconia company, which had received a grant on Nov. 17, 1629, arrived in 1630. The Laconia company received its first grant under the erroneous impression that the Piscataqua river had its source in or near Lake Champlain, and its principal object was to establish an extensive fur trade with the Iroquois Indians. The company sent over colonists who occupied the house left standing by Thomson and, not far away, built "Mason hall" or the "Great house" in what is now Portsmouth, a name (for the entire settlement) that replaced "Strawberry Banke" in 1653. Edward Hilton with a few associates appears to have established a settlement on Dover point about the time of Thomson's arrival at Little harbour, and in the Hilton grant of 1630 it is stated that he had already built houses and planted there; as early as 1630 this settlement was named Dover. In 1638 the Rev. John Wheelwright, an Antinomian leader who had been banished from Massachusetts, founded Exeter on land claimed to have been bought by him from the Indians. In the same year Massachusetts encouraged friendly Puritans to settle Hampton on the same purchase, and about a year later this colony organized Hampton as a town with the right to send a deputy to the general court. Serious dissensions had already arisen between Puritan and Anglican factions in Dover, and Capt. John Underhill, another Antinomian, became for a time a leader of the Puritan faction. Puritan Massachusetts was naturally hostile to the Antinomians at Exeter as well as to the Anglicans at Strawberry Banke. Under these conditions Massachusetts discovered a new claim for its northern boundary. The charter of that colony was drafted under the impression that the Merrimack flowed east for its entire course, but now an investigation was in progress which was to show that its source in Lake Winnipesaukee was several miles north of any of the four settlements in New Hampshire. Accordingly, Massachusetts resolved to make the most of the clause in the charter which described the northern boundary as three English miles

north of the Merrimack river, "or to the northward of any and every part thereof," to ignore the conflicting grants to Mason and to extend its jurisdiction over the offending settlements.

The heirs of Mason protested, but little was done about the matter during the period of Puritan ascendancy in the mother country. Immediately after the resignation of Richard Cromwell, however, Robert Tufton Mason (a grandson of the original proprietor), who had become sole heir in 1655, began petitioning first parliament and later the king, for relief. The commission appointed by the king in 1664 to hear and determine complaints in New England decided that Mason's lands were not within the jurisdiction of Massachusetts, and made an attempt to set up a government under which his claims could be tried, but this was a failure. Mason then petitioned again, and this time Massachusetts was requested to send agents to England to answer his complaints. They arrived in Dec. 1676, and the case was tried before the lords chief justices of the king's bench and common pleas in April 1677. Mason presented no claim to the right of government, and as to the title to the lands claimed by him the court decided that this was a question between him and the several tenants to be determined by the local court having jurisdiction in such matters. Thereupon Mason, in Jan. 1679, petitioned the king to appoint a governor who should have jurisdiction over all the lands which he claimed, and on Sept. 18 of this year New Hampshire was constituted a separate province with a government vested in a president and council appointed by the king and an assembly chosen by the people. This was the principal outcome of Mason's persistent efforts to establish his rights to the land.

From 1686 to 1689 New Hampshire formed a part of the dominion of New England which, after the first few months, was under Sir Edmund Andros as governor general. There being no provincial authority in New Hampshire at the close of this period, a convention of the leading citizens of its four towns attempted to establish one. Upon the failure of this attempt, a temporary nominal union with Massachusetts was formed, but in 1692 Samuel Allen, the assign of Mason, caused a royal government to be established with his son-in-law, John Usher, as lieutenant governor, and during the remainder of the colonial era New Hampshire was separate from Massachusetts except that from 1699 to 1741 the two had the same governor. The boundary disputes between Massachusetts and New Hampshire were long and bitter. Both provinces granted townships within the disputed territory; Massachusetts arrested men there who refused to pay taxes to its officers, and sought to defer the settlement of the dispute. New Hampshire, being on more friendly terms with the home government, finally petitioned the king to decide the matter, and in 1737 a royal order referred it to a commission to be composed of councillors from New York, Nova Scotia and Rhode Island. This body agreed upon the eastern boundary but evaded deciding the southern one. Both parties then appealed to the king, and in 1741 the king in council confirmed the decision of the commission in regard to the eastern boundary and established a southern boundary very favourable to New Hampshire. The western boundary was not yet defined, and as early as 1749 a controversy over that arose with New York. The governor of New Hampshire granted in the disputed territory 138 townships which were rapidly settled, but there was a reluctance to incur the expense of a contest with so powerful a neighbour as New York. In 1764 New York procured a royal order declaring the western boundary of New Hampshire to be the western bank of the Connecticut river.

At the outbreak of the Revolution New Hampshire had about 80,000 inhabitants, the great majority of whom were with the patriot or Whig party during that struggle. By June 1775 the once popular governor, Sir John Wentworth, was a refugee; on Jan. 5, 1776, the fifth provincial congress established a provisional government; on June 15 the first assembly elected under that government declared for independence; and on Aug. 16, 1777, the important victory at Bennington was won by New Hampshire and Vermont troops under the command of Gen. John Stark, who had a commission from New Hampshire. Six states had ratified the federal constitution when the New Hampshire convention met at Exeter on Feb. 13, 1788, to accept or reject that instrument, and so great was the opposition to it among the delegates from the central part of the state that after a discussion of ten days the leaders in favour of ratification dared not risk a decisive vote, but procured an adjournment in order that certain delegates who had been instructed to vote against it might consult their constituents. Eight states had ratified when the convention reassembled at Concord on June 17, and four days later, when a motion to ratify was carried by a vote of 57 to 47, adoption by the necessary nine states was assured.

The War of Independence left the state heavily burdened with debt and many of its citizens threatened with a debtor's prison. As a means of relief, a number of citizens demanded of the legislature the issue of paper money equal in amount to the state's debt; and, as this was refused, an armed mob numbering about 200 surrounded the meetinghouse in Exeter in which the legislature was in session, toward evening on Sept. 20, 1786. But Gen. John Sullivan (1740–95) was at that time president of the state; and on Sept. 21 he, with 2,000 or more militia and volunteers, captured 39 of the leaders and suppressed the revolt without bloodshed.

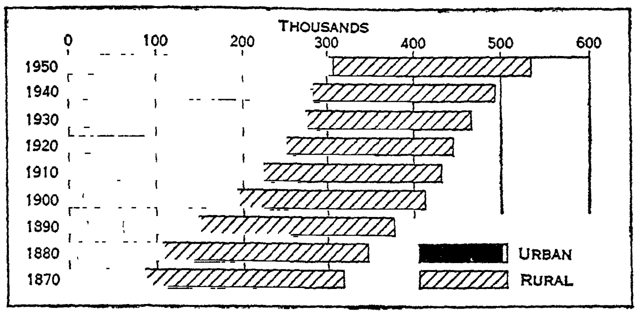
National elections in New Hampshire were carried by the Federalists until 1816, except in 1804 when Pres. Thomas Jefferson won by a small majority; but within this period of Federalist supremacy in national politics the Democrat-Republicans elected the governor from 1805 to 1812 inclusive except in 1809. In 1816 the Democrats won both state and national elections; and out of the transition from Federalist to Democratic control, which was effected under the leadership of William Plumer (1750–1850), a prominent politician in New Hampshire, arose the famous Dartmouth college case. As the trustees of this institution were Federalists with the right to fill vacancies in their number, the Democrats attempted to gain control by converting it into a state university and increasing the number of trustees, but when the case reached the U.S. supreme court that body pronounced (1819) the charter a contract which the federal constitution forbade the state to violate. Heretofore the Federalist regime had taxed the people to support the Congregational Church, but now the Baptists, Methodists and Universalists joined the Democrats, and in 1819 this state support was abolished by the "Toleration act." Because of Daniel Webster's arguments in the Dartmouth college case, and because his party had favoured the support of the Congregational Church by public taxation, he became very unpopular in this his native state. Accordingly, his denunciation of Pres. Andrew Jackson's bank policy added strength to the Jacksonian Democracy, and, later, his Whig connections were the greatest source of the Whig party's weakness in New Hampshire. John Quincy Adams was an intimate friend of William Plumer, the Democratic leader, and carried the state both in 1824 and 1828. The Whigs never won a national or state election, and often their vote was only about one-half that of the Democrats. But the Democrats broke into two factions in 1846 over the question of slavery (*see* HALE, JOHN PARKER); the American or "Know-Nothing" party elected a governor in 1855 and 1856; and then control of the state passed to the Republican party which held it until the presidential election of 1912 and 1916 when the Democrats won. Thereafter the state returned to its Republican tradition until 1936, 1940 and 1944 when it supported Franklin D. Roosevelt. The state government remained Republican although a Democratic governor was elected in 1922.

Population.—The population of New Hampshire in 1790 was 141,885; in 1840 it was 284,574; in 1880, 346,991; in 1910, 430,572; in 1940, 491,524; and in 1950, 533,242. This last figure represented an increase of 8.5% over the population in 1940. The population per square mile in 1950 was 59.1, as compared with 54.5 in 1940 and with 50.7 for the U.S. in 1950.

The urban area of New Hampshire in 1940 comprised 11 cities, the smallest having a population of more than 6,000, and 7 towns (townships) classified as urban under special rule. The population of this area was 283,225, or 57.6% of the state total. The population of the same area in 1950 was 301,249, or 6.4% more than in 1940, and represented 56.5% of the state total.

Prior to the enumeration in 1950, boundaries were set up for the thickly settled suburban area, or "urban fringe," around the

city of Manchester, and also for the larger villages outside this urban fringe, so that they might be enumerated separately from the towns in which they were located. In 1950 the urban area comprised 12 cities, the urban fringe around Manchester and 9 "unincorporated places" (villages for which arbitrary boundaries had been set up) of 2,500 or more. The urban population under this new definition amounted to 306,806, or 57.5% of the state total. Of the seven special-rule towns, one had been incorporated as a city and six were found to contain villages of urban size. The additions just specified were found to contain more inhabitants than were lost to the urban classification by the omission of the outlying parts of the six special-rule towns, so that the urban population of the state under the new 1950 rule was somewhat larger than it would have been under the 1940 rule.



BY COURTESY OF THE U S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEW HAMPSHIRE: 1870 TO 1950
The narrow white space at the end of the black section of the 1950 bar represents the population of the small additional area counted as urban under the new 1950 definition

The number of households in 1950 was 155,174, as compared with 135,960 in 1940. The average population per household had declined from 3.7 in 1940 to 3.4 in 1950.

*Final figures for 1950 based on *new* definition. *See* comment in text.

The population of the state was distributed by colour and nativity in 1950 as follows: 88.9% native white; 10.9% foreign-born white; and 0.2% nonwhite. Of the 58,134 foreign-born white, 60.0% were born in Canada, including 42.9% Canadian-French alone. There were 97.9 males per 100 females in the native white population and 88.9 in the foreign-born; 10.9% of the population was 65 years old or over; and 53.7% of the population 14 years old and over was in the labour force. Of the total number of employed males, 8.9% was engaged in agriculture, 8.7% in construction, 40.0% in manufacturing and 20.6% in transportation and trade and 12.5% in services of various kinds.

Government.—New Hampshire was the first of the original states to establish a government wholly independent of Great Britain. This was designed to be only temporary, but was in operation from Jan. 5, 1776, to June 2, 1784. The constitution provided for a general court consisting of a senate and a house of representatives and made the council a body advisory to the state president; the 1784 instrument was amended in 1792; with the amendments adopted in that year it is in large measure the constitution of today. For 60 years there was no change whatever, and only three amendments, those of 1852 (removing the property qualifications of representatives, senators and the governor), were adopted until 1877, when 12 amendments were adopted—the most important being those providing for biennial (instead of annual) state elections in November (instead of March), and those doing away with the previous requirement that representatives, senators and the governor "be of the Protestant religion." Five amendments were ratified in 1889, four in 1902 and four in 1912. Most important of those adopted in 1912 was one providing for the election of the governor and members of the council by a plurality instead of a majority vote. New Hampshire is the only state in which amendments to the constitution may be proposed only by a constitutional convention, and once in seven years at the general election a popular vote is taken on the necessity of a revision of the constitution. By an act approved on April 9, 1909, provision was made for direct nominations of candidates at primaries. The government of the state was extensively reorganized as a result of legislation passed in 1949.

There is a governor's council of five members, one from each councillor district, which has advisory duties and shares with the governor most of his powers. There is no lieutenant governor. The governor and the councillors are elected for a term of two years. The governor and council appoint all judicial officers, the attorney general, comptroller, important administrative boards and commissions and the medical referees; they have power to pardon offenses; and they may exercise some control over expenditure through the constitutional requirement of the governor's warrant for drawing money from the treasury. The governor may veto within five days, besides Sunday, after it has been presented to him, any bill or resolution of which he disapproves, and a two-thirds vote of the members of both houses is required to pass over his veto. A senate and a house of representatives, which together constitute the general court, meet at Concord on the first Wednesday in January of every odd-numbered year, and at such other times as the governor may appoint for a special session, principally for the making of laws and for the election of the secretary of state and the state treasurer. The senate is composed of 24 members, one from each senatorial district. Membership in the house of representatives varies according to a plan adopted in 1931, by which towns having less than 600 inhabitants elect representatives according to a special schedule. There were 399 representatives chosen in 1950. Both senators and representatives are elected for a two-year term.

For the administration of justice the state has a supreme court and a superior court, each county has a probate court, and some towns as well as the cities have a municipal court. The supreme court consists of a chief justice and four associate justices; the superior court, of a chief justice and five associate justices. The supreme court sits at Concord on the first Tuesday of every month except July and August; while the superior court holds two or three sessions a year in each of the ten counties. Each county has a single probate judge, who has jurisdiction over the probating of wills, insolvency proceedings, decisions regarding adoption of children and similar judicial functions. Supreme, superior and probate judges are appointed by the governor and council to serve until they are 70 years of age. Municipal judges are similarly chosen. Like justices of the peace, they have jurisdiction in criminal cases where the punishment is by fine not exceeding $20, by imprisonment not exceeding six months, or by both, and in minor civil cases. A municipal court has the same jurisdiction as that of justices of the peace, and municipal judges possess, in addition, concurrent jurisdiction with the superior court in certain cases where the title to real estate is not involved and the damage demanded does not exceed $100. Justices of the peace are appointed for a term of five years only, but they may be reappointed. Local affairs are administered by counties (ten in number), towns (townships), village districts and cities. In each county a convention, composed of representatives from the towns, meets every two years to levy taxes and to authorize expenditures for grounds and buildings whenever more than $1,000 is required. For the discharge of other county functions the qualified electors of each county elect every two years three commissioners, a sheriff, a solicitor, a treasurer, a register of deeds and a register of probate; two auditors also are appointed annually by the supreme court. The county commissioners have the care of all county property, as well as of county paupers;

and once every four years they are required to visit each town of their county, inspect the taxable property therein, determine whether it is incorrectly assessed and report to the state board of equalization. In each town a regular annual meeting of the qualified electors is called on the second Tuesday in March for the transaction of miscellaneous business and the election of town officers.

Finances.—The total valuation of property for the purposes of taxation in 1950 was $746,825,197; the total of taxes assessed in cities, towns and unincorporated places was $32,691,619 or $43.10 per $1,000. The chief sources of the income of the state government in 1950 were the gasoline tax, motor vehicle and operators' licence fees, income derived from taxes on beer and taxes on, or the sale of liquor (sold in state liquor stores), the tobacco tax and income derived from the regulation of betting on horse racing. The total income of the state government for the year ending June 30, 1950, was $50,099,272 of which $44,849,272 was revenue and $5,250,000 borrowed money. The total payments for the same period were $49,659,306. The cash balance on hand July 1, 1950, was $4,021,271 as compared with $3,422,728 a year before.

Education.—New Hampshire formed a part of Massachusetts when, in 1647, the general court of that province passed the famous act requiring every town in which there were 50 householders to maintain a school for teaching reading and writing, and every town in which there were 100 householders to maintain a grammar school. During the 19th and early part of the 20th century various experiments for improving the public school system were tried.

The public-school system has at its head a state board of education composed of seven persons appointed by the governor and council. The administrative work is carried on by a commissioner of education, appointed by the board for an indefinite term, a deputy commissioner, nominated by the commissioner and appointed by the board, and a director of technical institutes, appointed by the board. Each town is constituted a school district, and some special districts are organized under special acts of the legislature. For the purpose of inspecting and supervising all institutions in which state money is spent, the several school districts in the state are combined into supervision unions consisting of one or more school districts. The schools are maintained chiefly out of the proceeds of a district school tax, which must not be less than $3.50 on each $1,000 of assessed property. To this is added a "literary fund" (designed originally for founding a college) from various sources. All children between the ages of 8 and 16 are required to attend either a public or an approved private school for the full term unless they are more than 14 years old and have completed the studies prescribed for the elementary schools, or have been excused by the school board on account of physical or mental infirmity. For the year ending June 30, 1950, there were 73,314 attending public schools and 26,429 attending parochial or private schools or approved public academies. Of the total public school enrolment, 52,513 were in the elementary grades and 18,823 in high schools. There were 6,440 in other secondary schools. The total expended on public-school education for the same year was $18,043,423.25.

The only state institutions of higher education are the Plymouth Teachers college (1870) at Plymouth, the Keene Teachers college (1909) at Keene and the University of New Hampshire, organized as a department of Dartmouth college in 1866, but reorganized as the New Hampshire College of Agriculture and Mechanic Arts and removed to Durham as a separate institution in 1893. It was given its present name in 1923 by an act of the legislature. Other institutions of higher learning in the state are Dartmouth college (nonsectarian, 1770) at Hanover and Saint Anselm's college (Roman Catholic, 1889) at Manchester.

Charities and Corrections.—The state charitable and correctional institutions include the New Hampshire school for feeble-minded children, at Laconia; the New Hampshire soldiers' home, at Tilton; the New Hampshire industrial school, at Manchester; the New Hampshire hospital for the insane, and the state prison, at Concord; and the New Hampshire sanatorium for tuberculars, at Glencliff in the town of Warren. The state also makes annual appropriations for the care and education of blind and deaf and dumb persons in institutions outside of the state. Each county has an almshouse and house of correction.

Agriculture.—Agriculture on the farms of New Hampshire still working has been greatly modified, the production of vegetables, fruits, dairy products, poultry and eggs largely supplanting the production of cereals. The total acreage in farms decreased from 3,249,458 in 1910 to 2,017,049 in 1945. During the same period the number of farms decreased from 27,053 to 18,786, and average acreage per farm from 120.1 to 107.4. The value of all farm property, including lands and buildings, had likewise decreased from $103,704,196 to $80,394,869; average value per acre in 1945 was $39.86. Of the total number of farms in the state in 1945 (18,786), 17,880 were worked by owners or part owners, 668 by tenants and 238 by managers. The total value of all farm crops in 1949 was $17,832,000. Hay was the principal crop; in 1949 the acreage was 361,000 and the yield was 391,000 tons, valued at $13,020,000. Apples were the crop second in importance, valued at $1,954,000, and potatoes were third in importance, valued at $1,529,000. Dairying has long been an important industry in New Hampshire. In 1949 the milk production was 337,000,000 lb. and the gross income from dairy products was $19,008,000. The gross income from the poultry and egg production of 1949 was $29,725,000. The livestock on the farms of the state on Jan. 1, 1950, included 10,000 horses, 7,000 sheep, 13,000 swine and 118,000 cattle.

Forests and Fisheries.—Except on the summits of the higher mountains New Hampshire was originally an unbroken forest of which the principal trees were the white pine, hemlock, sugar maple, yellow birch, beech, red oak and white oak in the south, red spruce, balsam and white birch on the upper mountain slopes, and red spruce, white pine, sugar maple, white spruce and white cedar in the other parts of the north. For 1948 the U.S. forest service reported a forestland acreage of 4,847,800—83.9% of all land in the state. Of this forest land, 12% was good saw-timber stand, 26% light saw-timber stand, 37% pole-timber stand and 25% poorly stocked. The federal government owned 585,000 ac. or 12.5% and 96,800 ac. or 2.1% were owned by the state, counties or municipalities. The forests of the state produced, in 1947, 327,882,000 bd.ft. of lumber, 243,093 standard cords of pulpwood and 279,272 standard cords of fuel wood. Total yield of primary timber products (logging waste included) was 108,400,000 cu.ft.

New Hampshire, with only one coastal county (Rockingham), in 1947 was credited with less than 0.1% of New England's fishing yield. The total yield of its fisheries amounted to 707,000 lb., valued at $238,400.

Minerals.—The most important of the mineral products of New Hampshire, which has long been known as the "Granite state," is granite, which is quarried in the southern part of the state in the area of Lake Winnipesaukee; gneiss, near Concord, Merrimack county, near Milford, Hillsboro county and east of Manchester in Rockingham county; in Sullivan county, near Sunapee; and in the east central region in Carroll county, near Conway and Madison. The U.S. bureau of mines reported that the value of stone quarried in New Hampshire in 1949 was $381,141. Clay products ($19,795), peat ($296), noncommercial sand and gravel ($236,895) and other minerals (abrasive stones, beryllium concentrates, feldspar, mica, commercial sand and gravel, etc.) valued at $746,009, make a total value, for all 1949 mineral products of the state, of $1,384,136. Mica, first mined at Grafton, Grafton county, in 1803, was later found in other parts of the state in such quantities that for 60 years New Hampshire was the largest producer of mica in the United States.

Manufactures.—The values of the products for all manufacturing industries of New Hampshire combined for 1924, 1935 and 1947 were $333,124,503; $209,384,111; and $306,932,000 (value added by manufacture) respectively. The number of industrial establishments (1,078, 788 and 1,124) and the number of wage earners (75,310, 54,212, 74,752) showed a corresponding trend. Textiles and leather and leather products represented in 1947 approximately one-half of the total. Cotton goods, the leading industry for more than a century and a quarter after its introduction in 1804, was replaced by woollen goods in the textile in-

dustry. The textile industry in 1947 had 108 mills, employed 20,456 employees and had an output value added by manufacture of $85,318,000. The manufacture of leather and leather products (chiefly boots and shoes) accounted for 115 factories, gave employment to 20,070 and had a product value added by manufacture of $70,107,000. The other leading industries and the value of their products added by manufacture in 1947 were paper and allied products $33,520,000, machinery (except electrical) $32,209,000, lumber and products (except furniture) $22,447,000 and printing and publishing industries $10,960,000. Most of the manufacturing centres of the state are south of Lake Winnipesaukee. An exception is Berlin, the chief manufacturing centre north of the White mountains, important for its manufacture of paper and wood pulp.

Transportation.—With the exception of the Grand Trunk line in the northern part of the state the several steam railways are owned or leased by the Boston and Maine. This company was the first to operate a railway within the state, service being maintained between Boston, Mass., and Dover, N.H., as early as 1842. The steam railway mileage decreased from 1,234 to 951 during the years 1925–46. The amounts spent by the highway department have varied. A total of $12,940,124 was disbursed during the calendar year 1950. This amount included expenditures for construction, maintenance, interest and principal payments on highway bonds, transfers to local units, etc.

NEW HARMONY, a village in Posey county, Indiana, on the Wabash river, about 22 mi. N.W. of Evansville. Pop. (1950) 1,380. It is served by the Illinois Central railway. New Harmony had its beginning in 1814–15, when it became the home of a communistic religious sect known variously as the Harmonists, Harmonites and Rappites, founded in Germany toward the end of the 18th century by George Rapp (1757–1847), a native of Iptingen in Württemberg. Rapp and his followers, who sought to form a community after the manner of the primitive Christian church, were persecuted in Germany, and in 1803–04 emigrated to Butler county, Pennsylvania. There they established in 1805 a community known as Harmony, consisting of about 600 persons, who held their property in common and in 1807 adopted celibacy. In 1814 Rapp sold most of his Pennsylvania land and bought about 24,735 ac. (in the next ten years more than 14,000 ac. in addition) on the Wabash river in Indiana territory. In 1814–15 Rapp and a thousand of his followers settled on the Indiana tract, their headquarters being established at New Harmony or Harmonie as they called it. The settlers, mostly Germans, devoted themselves to agriculture, weaving and leatherworking so industriously that they prospered from the start. Rapp, however, in 1825 disposed of his lands and property to Robert Owen, having returned with part of his followers to Pennsylvania and founded a new community known as Economy, in Beaver county, where he died in 1847. Intent on founding a socialistic community, Owen went to the United States in 1824, and purchased Rapp's lands and livestock for $182,000. He interested several well-known scientists in his settlement, and with them went to New Harmony in the spring of 1826. Within six months the community numbered more than 1,000.

Among the most notable members of the community were Robert Owen's sons, Robert Dale Owen (1801–77), a political leader and diplomat; David Dale Owen (1807–60) and Richard Owen (1810–90), both geologists of note; William Maclure (1763–1840), the founder of the Academy of Natural Sciences at Philadelphia; Thomas Say (1787–1834), "the father of American zoology"; Charles Lesueur, a scientist and antiquarian; and Gerard Troost (1776–1850), a well-known geologist.

The greater part of the settlers, however, were impractical theorists or adventurers. Constitution after constitution was adopted, and with the adoption of each new constitution and with each new religious discussion a group would secede and form a separate community—in 1828 there were ten.

The best known and most successful group was Macluria (like the others, occupying a part of Owen's land), named after William Maclure, who became its directing power.

The whole organization broke up in 1827, and Owen left New Harmony in 1828. The Workingmen's Institute Public library, founded in 1838 by William Maclure, has a collection rich in works dealing with socialism.

NEWHAVEN, a seaport and urban district of Sussex, Eng., 56 mi. S. from London by the Southern Region Railway route, on the English channel at the mouth of the Ouse. Pop. (est. 1938) 7,062. Area 2.8 sq.mi. The port is protected by fortifications. A harbour was first granted to Newhaven in 1713, and during the early 18th century it possessed a large shipping trade. It is a packet station. The tidal harbour is enclosed by two piers and a breakwater, the area being about 30 ac. and the quayage 1,400 yd. There is ordinarily a large traffic with France in wines, spirits, silk, fruit, vegetables and general provisions.

NEW HAVEN, the second largest city of Connecticut, U.S.A., a port of entry, the county seat of New Haven county and the seat of Yale university; in the southwestern part of the state, on Long Island sound, 72 mi. E.N.E. of New York city. It is on federal highway 1, and is served by the New York, New Haven and Hartford railroad, interurban trolleys, motorbus and truck lines and coastwise steamers. Pop. (1950) 163,344; (1940) 160,605; (1930) 162,655.

The city of New Haven occupies 22.45 sq.mi. at the head of a broad, deep bay, into which empty the Quinnipiac, the Mill and the West rivers. New Haven's site is a level, sandy plain, behind which rises a line of hills, terminating in two spurs, East Rock (360 ft. high) and West Rock (400 ft.), respectively 2¼ and 2 mi. from the green. On the central green of 16 ac., reserved for the public when the town was laid out, are three churches built in 1814: Trinity (Protestant Episcopal), United (Congregational) and Center (Congregational; designed by Ithiel Towne). Facing the green are some of the buildings of Yale university (*q.v.*), a large hotel and the principal public buildings. The Harkness tower of the memorial quadrangle of the university can be seen from the green, and near by is the old Grove Street cemetery, containing the graves of many famous Americans. The Yale Bowl (seating 70,896) is in the western part of the city. New Haven has long been called "the city of elms." Parks, playgrounds and public squares cover 2,119 ac. In West Rock park is a cave where the regicide judges Edward Whalley and William Goffe are said to have been hid for several weeks when pursued by royal officers in 1661. Nathan Hale park contains old Fort Hale (used in 1812), with its moat and defenses well preserved. A large tract at Lighthouse point (the eastern end of the harbour) is developed as a municipal bathing beach and seaside park. New Haven is the seat of a state teachers' college (established 1893), Albertus Magnus college for women (Roman Catholic) Larson college (girls), New Haven YMCA·Junior college, Junior College of Commerce, Whitney Art School and Connecticut university college of pharmacy. There are also a number of widely known private academies for boys and girls, including the Hopkins Grammar school, established in 1660. Among the newspapers are the morn-

ing *Journal-Courier* (1766), and the evening *Register* (1812).

New Haven is an important commercial and industrial city. The general offices of the New York, New Haven and Hartford railroad are there, and just outside the city is its Cedar Hill freight classification yard, covering 1,160 ac. The traffic of the harbour amounted to 5,250,489 tons in 1950. There are 375 wholesale houses, doing a large business. The manufacturing industries are widely diversified and highly specialized, with an output in 1949 valued at $250,000,000. Among the leading products are guns, ammunition, hardware, corsets, wire and wire goods, paper boxes, razor blades, plastic products, automobile ignitions and clocks. A coke plant manufactures gas which is piped to towns as far as Hartford. Bank debits in 1949 aggregated $2,158,426,934. The city's assessed valuation for 1949 was $365,038,253. It operates under a mayor and aldermen form of government. New Haven is a leading medical centre.

In the spring of 1638 a company of English Puritans, led by Theophilus Eaton and the Rev. John Davenport, established a settlement there. It was governed under a "plantation covenant" until June 4, 1639, when the "free planters" adopted a theocracy. They agreed that the Scriptures should be their guide in civil affairs, and that only approved church members should be admitted to the body politic; 12 men were appointed to choose 7 men ("7 pillars") who should found the church and admit to its original membership such planters as they thought properly qualified. This having been done, the first general court of which there is record met on Oct. 25. At this court the members of the new church, together with six members of other approved churches, were admitted to citizenship; a magistrate, four assistants, a secretary and a constable were chosen as the civil officers; annual elections and an annual session of the general court in the last week of October were agreed upon; English statute and common law were expressly excluded; and the "worde of God was adopted as the onely rule to be attended unto in ordering the affayres of government in this plantation." As thus founded, New Haven was town and colony combined.

In 1643–44 the towns of Guilford, Milford, Stamford, Branford and Southold on Long Island were admitted to the "New Haven jurisdiction." The government of the jurisdiction was of the strictest Puritan type, but some of the 45 "blue laws" ascribed to it were enactments of other New England Colonies, and some were pure invention. Among those laws which the Rev. Samuel Peters in his *General History of Connecticut* ascribed to New Haven which were wholly or substantially true are the following: "The judges shall determine controversies without a jury"; "married persons must live together or be imprisoned"; "a wife shall be good evidence against her husband"; "no minister shall keep school"; "the selectmen, on finding children ignorant, may take them away from their parents and put them into better hands, at the expense of their parents." Among those in the same list which are wholly or in part spurious are: "No woman shall kiss her child on the Sabbath or fasting day," and "No one shall travel, cook victuals, make beds, sweep house, cut hair or shave on the Sabbath day."

In 1664 New Haven, with the other towns (except Southold) of the jurisdiction, became part of the Colony of Connecticut, and in 1784 it was chartered as a city. From 1701 to 1873 New Haven was one of the capitals of Connecticut. A state house (designed by Ithiel Towne after the temple of Theseus) stood on the green, or market place, from 1827 until 1889. In 1716 the Collegiate School of Connecticut, which developed into Yale university, was moved to New Haven from Saybrook. After 1763 a thriving trade with the West Indies, Newfoundland and neighbouring ports on the Atlantic coast began to develop, which flourished, with some periods of depression, until the War of 1812; and after 1800 commerce sprang up with China, the East Indies, the Pacific and the South Seas. A collector of the port was appointed in 1760. In 1769 the merchants at a public meeting unanimously agreed not to import goods from England, but in June 1770 they renounced the agreement and voted to open the port. When the news of the embargo of Boston arrived, a committee of correspondence was formed at once; and through the Revolution the people supported the American cause with ardour, though there were many Loyalists in the town, 75 of whom had property confiscated. On July 5, 1779, the town was invaded and sacked by Gen. William Tryon, but he was driven out before he could burn it. When the War of 1812 opened there were fully 600 seamen in the city (among them Capt. Isaac Hull), all engaged in privateering or in the regular naval service of the United States. Manufacturing began early. Shoes were shipped from the town in 1647 and ironworks were opened in 1656. The loss of foreign trade through the War of 1812, the opening of the Farmington canal in 1828 and the building of the railroad in 1833–38 gave such impetus to industrial development that manufacturing rapidly became the chief interest of the city. In 1820 the population was 8,327; in 1860, 39,267; in 1900, 108,027. New Haven was the birthplace or the home of many inventors, including Eli Whitney, Eli Whitney Blake, Charles Goodyear, Thomas Sanford, James Brewster, David Bushnell, Samuel F. B. Morse, Elias Loomis, Chauncey Jerome and Henry S. Parmelee; and it was the home of Noah Webster and Willard Gibbs.

NEW HEBRIDES, an island group in the western Pacific, about 50 mi. W. of Fiji and 250 mi. N.E. of New Caledonia. Area 5,790 sq.mi., pop. (1942) about 45,000, including about 40,000 natives, 150 British, 750 French, 2,100 Tonkinese and some other Asiatics. The islands are under a condominium, or joint British and French administration.

Administration.—The islands were placed under joint Anglo-French administration, as provided by the Anglo-French convention of Feb. 1906, which was ratified in Oct. 1906, and the Anglo-French protocol, signed in London in 1914 and ratified only in March 1922. Great Britain and France are represented in the islands by high commissioners, who delegate their powers to resident commissioners stationed in the group. There are British and French courts, together with a mixed court with a judge who is a national neither of Great Britain nor of France. The New Hebrides are south and west of the farthest points reached by the Japanese in their southward advance in 1942 and were therefore not directly drawn into the Pacific hostilities. British high commissioner in 1950: Sir Leslie Brian Freeston. French high commissioner: Pierre Cournarie. British resident commissioner: R. D. Blandy. French resident commissioner: P. Anthonioz.

History.—The islands were sighted by the Portuguese navigator Pedro Fernandez de Quiros in 1606. Believing he had discovered a great southern continent, he named it Australia del Espiritu Santo. The islands were visited by the French explorer Louis de Bougainville in 1768, and received their present name from the British navigator Capt. James Cook in 1774. Their rugged outline suggested the Hebrides Islands off the northern coast of Scotland.

The islands were found to be rich in sandalwood and were opened up to communication with the outside world by the visits of traders and missionaries during the 19th century. Great Britain and France declared the New Hebrides neutral in 1878. Both Great Britain and France found occasion to intervene in protection of the lives of their nationals in clashes with the natives. The islands were placed under the surveillance of a mixed Anglo-French commission of naval officers in 1887.

A more detailed scheme of joint administration went into effect as a result of the convention of 1906. This provided that British and French nationals should have equal rights in all respects and that each power should retain jurisdiction over its own subjects or citizens. It was agreed that there should be no penal settlement and no fortifications on the islands. The second protocol, ratified on March 18, 1922, regulated British, French and native interests, fixed conditions of land tenure and provided regulations for the recruiting of native labour. The sale of drink and firearms to natives and the practice of forced labour are illegal.

Topography and Climate.—Espiritu Santo, with an area of 875 sq.mi., is the largest of the islands. Efaté, with the two excellent harbours of Vila and Havannah, is the seat of the administration, located in Vila. Port Sandwich, largest port in the islands after Vila, is on the island of Malekula (Mallicolo). The islands are of volcanic, not coral, formation and some active volcanoes still exist. Because of their volcanic origin, the islands reach a con-

siderable elevation, Mount Lopevi reaching a height of 4,755 ft. A height of 6,169 ft. has been recorded in Espiritu Santo. The climate is generally hot and damp, especially in the months between November and April. Natural vegetation is luxuriant and abundant.

Ethnology and Education.—The natives are Melanesians of mixed blood, with a minority of Polynesians in some places. As is usually the case in Melanesian lands, the natives are divided into small tribal units, no one of which acknowledges the authority of another. Cannibalism is still found in Espiritu Santo, Malekula and the Pentecost Islands. Education is largely in the hands of Catholic and Presbyterian missions. There are hospitals with foreign doctors and nurses and there are one government school and two Catholic mission schools for the white population. Malaria and various fevers are prevalent in the islands. Infectious diseases like influenza and whooping cough are sometimes brought into the islands by foreigners and take a high toll of the natives whose sanitary standards are low.

Economics and Finance.—The islands produce bananas, sugar cane, oranges, tropical fruits, corn, vanilla and coconuts. There are several British and French trading companies. New Hebrides trade is mostly with Australia and New Caledonia. Principal imports are food, clothing, metal wares and furniture. Exports include copra, cocoa, coffee, cotton and kauri logs. Imports of wine and spirits, arms and ammunition are forbidden, except under special permit.

Imports were £88,800 sterling, exports £107,688 sterling in 1941. Administration revenue in 1942 was £31,048 sterling and expenditure was £20,061 sterling. (W. H. Ch.)

NEW HYDE PARK, a city in Nassau county, N.Y., U.S., in the southeastern part of the state, 15 mi. E. of Brooklyn. It is served by the Long Island railway.

The population by the federal census was 7,323 in 1950 and 4,691 in 1940.

The city has a mayor-council form of government; the mayor is selected for a term of two years by four elected councilmen.

New Hyde Park is known as a residential city. There is a hosiery mill in the city, and there are a number of truck farms in the surrounding areas.

Two weekly newspapers are published there, and the city also has a public library.

NEW IBERIA, a city of Louisiana, U.S., 125 mi. W. of New Orleans, on Bayou Teche and federal highway 90; county seat of Iberia parish. It is served by the Missouri Pacific and the Southern Pacific railways, and by a barge canal connecting with the intracoastal canal. Pop. 16,460 in 1950; 13,747 in 1940. This rich agricultural region is the home of the "Acadians" from Nova Scotia. Near by are Avery, Jefferson and Weeks Islands, all of which have salt mines. On Jefferson Island was the home (Bob Acres) of Joseph Jefferson, and on Avery is a bird refuge. The city was laid out in 1835, chartered in 1839.

The "colony of Iberia" appears in the census reports of the Spanish government for 1785 and 1788 with a population of "190 souls." The name of the city is one of the few Spanish names which remain in southern Louisiana.

A severe yellow fever epidemic struck New Iberia in 1839, and virtually every family there suffered from the disease. A heroine of the emergency was an old Negro slave named Félicité, who indefatigably and skilfully ministered to the sufferers. Her feats became a legend in the community. The city was not freed from the threat of recurrent epidemics until the disease was conquered early in the 20th century.

Although no military engagements took place there, New Iberia fell to the Union forces during the Civil War Red river campaign in 1863.

NEW IRELAND (native *Tombara*), an island of the Bismarck archipelago, lying east of New Guinea, in the Pacific ocean, and northeast of New Britain, practically at right angles to its northern end. It is long, narrow, and mountainous (maximum height, 6,500 ft.), with no rivers of any size. Geologically it is older than New Britain (*q.v., see* also New Guinea), but it has not the definite volcanic appearances of that island. The coast line is fairly even, and there are good harbours at Kaewieng, Namatanai and Muliama. It is divided into two districts, northern (Kaewieng), and southern (Namatanai), the latter including the small island of New Hanover. Kaewieng is a port with a wharf capable of berthing ships up to 2,000 tons. There are fair roads in many places, and ordinarily there is steamer communication with New Britain and the mainland. The natives resemble those of New Britain. New Ireland formed part of German New Guinea; it was captured by Australian forces in 1914, was mandated by the League of Nations to Australia. The island was seen by Jacob Lemaire and William Cornelis Schouten in 1616, recognized as separate from New Guinea by William Dampier, in 1700..

New Ireland was invaded by the Japanese Jan. 23, 1942. Kaewieng became a Japanese naval base second in importance in this part of the Pacific only to Rabaul in New Britain. Japanese shipping there was bombed by United Nations air forces.

NEW JERSEY, the "Garden state," is an Atlantic coast state of the United States lying between approximately 38° 56′ and 41° 21′ N. and 73° 54′ and 75° 35′ W. Except for its 50-mi. northern border with New York, its boundaries are natural waterways, more than 300 mi. of which are navigable: on the east the Atlantic ocean, and the Hudson river which for 22 mi. separates the state from New York; on the west and south the Delaware river and bay which separate it from Pennsylvania and Delaware. New Jersey has an extreme length, north and south, of 166 mi., an extreme width, east and west, of 57 mi. and a total area of 7,836 sq.mi. Its inland water area is 314 sq.mi. The land is 46% in forests, 40% in farms.

Physical Features.—The state's four topographic belts record 1,000,000,000 years of rock forming, mountain building, erosion, submergence, re-emergence, glaciation. Crossing the northwest corner of the state, the folded Appalachian belt includes Kittatinny mountain and valley. The Kittatinny mountain range with northeast-southwest trend, crosses the Delaware river at the Water Gap and continues southwest into Pennsylvania. Where the crest of the ridge enters the state, its elevation is 1,539 ft.; at High Point, 1 mi. S.W., the ridge attains 1,805 ft., the highest point in the state. A short distance to the southwest, in a depression in the crest, is Lake Marcia at an elevation of 1,570 ft. The Water Gap testifies to the power of the river which, holding to its course as the mountain rose, formed a valley 900 ft. wide at the base and 4,500 ft. wide at the top with sides rising impressively to a height of more than 1,200 ft.

Southeast of and parallel to the Kittatinny range, the Kittatinny valley, about 40 mi. long and 12 mi. wide, has an average elevation of 700 ft. The second topographic belt, the highlands, parallels this valley on the southeast. With average altitude of about 1,000 ft., this upland plateau, bisected by streams into a series of ridges extending from northeast to southwest for 60 mi., is 9-18 mi. wide and embraces 900 sq.mi. The third belt, or Triassic lowland, with altitude ranging from sea level to 900 ft., has traprock ridges, the best-known of which is the Palisades on the Hudson. The trap extends to the Kill van Kull channel and includes the First and Second Watchung (or Orange) mountains west of the suburbs known as the "Oranges." Bordered on the northwest by Pompton, Morristown, Lebanon and Highbridge, and on the southeast by a line extending from Woodbridge to Trenton, it occupies about one-fifth of the surface of the state. To the southeast the fourth topographic belt—a coastal plain, bordered on east, south and west by water, with an area of 4,400 sq.mi., highest near its centre—ranges mostly under 100 ft. in altitude. About one-eighth is tidal marsh, lying chiefly between the barrier beaches of the coast and the mainland. The average elevation for the state is 250 ft. These four belts correspond closely to the outcrops of the geological formations: the rocks of the Appalachian belt being Palaeozoic; the formation of the highlands, Archaean; the Triassic lowlands, Triassic; the irregular hills of the coastal plain, Cretaceous and Tertiary. The great terminal moraine of the glacial epoch crosses the northeast-southwest topographic belts of the state in an irregular line west and northwest from Staten Island, N.Y.

The Delaware river, from its junction with the Neversink river to the capes, flows along the western and southern borders of the

state for 245 mi. and has a total drainage area in New Jersey of 2,345 sq.mi. The Hudson drains a small part of the state but has contributed materially to its commercial development. The principal stream of the highlands and Triassic lowland, the Passaic, rising in Morris county, passes through a gap in the traprock at Little falls, descends 40 ft. and at Paterson drops 70 ft. as the Great falls of the Passaic and, bending southward, empties into Newark bay. It drains an area of about 950 sq.mi. The Hackensack river enters the state about 5 mi. W. of the Hudson, flows almost parallel with it and empties into Newark bay, having a length of 34 mi. and a drainage area of 201 sq.mi. The Raritan, the largest stream lying wholly within New Jersey, flows eastward through the centre of the state and drains 1,105 sq.mi. Among the highlands are numerous lakes of which the largest are Lake Hopatcong in Morris and Sussex counties and Greenwood lake partly in New York and partly in New Jersey.

The soils vary greatly: those of the northern and central sections are made up in part of glacial drift; those of the south are sandy or loamy and enriched locally by deposits of marl. The most fertile soils lie in the clay and marl region, a belt 10–20 mi. wide extending in a general southwesterly direction from Long Branch to Salem.

Climate.—Because of the proximity of the ocean in the south and the relatively high altitudes in the north there is a greater variation in climate between the extreme northern and southern sections of the state than would naturally result from their difference in latitude. The mean annual temperature ranges from 49.8°at Sussex in the north to 54.7° at Bridgeton in the south. At Sussex the mean for the winter is 28° with an extreme minimum of −24°, the mean for the summer is 69.7° with extreme maximum recorded of 106°. At Atlantic City the annual mean temperature is 52.9°: for the winter it is 34.8° with an extreme of −9°; for the summer, 71° with an extreme of 104°. The normal annual precipitation is 45.6 in. varying from slightly less than 36 in. at Runyon to slightly more than 50 in. at Toms River and at Paterson. The growing season is 155 days in the Kittatinny mountain region and 203 days on the coast.

History.—The earliest inhabitants of New Jersey of whom there is clear record were the Leni-Lenape or Delaware Indians, of the Algonkin family. In 1758 an Indian reservation, perhaps the first in the U.S., was established at Edgepelick or Brotherton (Indian Mills). When in 1832 the legislature settled the Indians' last claims their spokesman declared, "Not a drop of our blood have you spilled in battle; not an acre of our land have you taken without our consent."

Although in 1524 the Florentine, Giovanni da Verrazano, under French authority, and in 1525 the Portuguese Estevan Gomes, in the service of Charles V, visited what is now New Jersey, voyages to those shores for exploration, trade and settlement really began in 1609 when Henry Hudson, an English navigator employed by the Dutch East India company, sailed up the river which bears his name. Cornelis Jacobson Mey (1614) and Cornelius Hendricksen explored the Delaware. In 1623 permanent homeseekers arrived at New Amsterdam. Some built Fort Nassau near the present Gloucester. On the western bank of the Hudson others had established by 1640 the trading post of Hobocan Hackingh, on the site of Hoboken. From all of these places the Dutch spread into the Raritan valley. Meanwhile, in 1638, 50 Swedish colonists landed on the western bank of the Delaware and built Fort Christina on the site of Wilmington. A triangular fort, called Elfsborg, was constructed in 1643 on the eastern bank near modern Salem. In 1655 Peter Stuyvesant brought these settlements under Dutch control.

On March 12, 1664, Charles II granted to his brother James, duke of York, all lands between the Connecticut river and the eastern side of Delaware bay and all islands between Cape Cod and the Hudson. An expedition left England in May under Richard Nicolls and in August the English flag floated over New Amsterdam. In October, when Sir Robert Carr seized the settlements on the Delaware, the few inhabitants of what is now New Jersey acquiesced. While Nicolls was still at sea, the duke of York, by deeds of lease and release, transferred to Lord John Berkeley, baron of Stratton, and Sir George Carteret (*q.v.*) all that part of his new possessions extending eastward from the Delaware bay and river to the Atlantic ocean and the Hudson river, and northward from Cape May to a line drawn from the northernmost branch of the Delaware, "which is 41° 40′ lat.," to the Hudson river in 41° N. latitude. He accompanied the grant with a unique transfer of political authority over all who should settle within its limits. To this tract the name of Nova Caesarea, or New Jersey, was given in honour of Carteret who governed the Isle of Jersey in 1643–51.

To attract immigrants the proprietors in Feb. 1665 published their "Concessions and Agreement" by which they provided for a governor, a governor's council and an assembly chosen by the freemen and empowered to levy taxes. Land grants were offered to persons embarking with the first governor. Meanwhile Governor Nicolls of New York, ignorant of the grant to Berkeley and Carteret, had confirmed Indian sales to settlers of sites which later became Elizabethtown, Middletown and Shrewsbury. In 1669 trouble between the proprietary governor and the inhabitants of the last two towns over quitrents caused the nullification of the grants made by Nicolls. Four years later the Dutch fleet brought New Jersey under Dutch control, but England reacquired it by the treaty of Westminster, Feb. 9, 1674. The eastern half of the state was restored to Carteret's proprietorship. Berkeley had sold to John Fenwicke and Edward Byllynge, Quakers, his lands which subsequently were acquired by William Penn, Gawen Lawrie and Nicholas Lucas.

By the "quintipartite deed" of July 1676, the province east of the line from Little Egg harbour to a point on the Delaware river in 41° 40′ N. (East Jersey) was assigned to Carteret, and that west of this line (West Jersey), about five-eighths of the whole, to the Quaker associates (first Quaker colony in America). In 1677 230 Quakers from London and Yorkshire founded a settlement which became Burlington. East Jersey was never actually governed under the liberal "Concessions and Agreements," presumably drafted by Penn, because Byllynge's title to the land conveyed to him alone the right to govern. Byllynge commissioned Samuel Jennings as deputy governor with the consent of the other proprietors. Jennings called the first assembly which passed fundamental laws providing for a governor and council. Meanwhile the death of Sir George Carteret gave the governor of New York, then Sir Edmund Andros, another chance to claim the jurisdiction. In 1680 after Philip Carteret, the governor, had been forcibly carried to New York and imprisoned, Andros appeared before the East Jersey assembly as governor, but the deputies refused to pass the measures he recommended. A New York jury freed Carteret of charges of illegal exercise of authority and the duke of York recalled Andros. In 1682 the province which Sir George Carteret had bequeathed to eight trustees to administer for the benefit of his creditors was purchased at public auction by Penn and 11 associates for £3,400. Each sold one-half of his share thus making 24 proprietors whom the duke of York authorized to govern the province. They directed the appointment of the American Board of Proprietors (1684) who with the deputy governor cared for such proprietary interests as approval of legislation and grant of lands. In 1686 Perth Amboy, the newly created port of East Jersey, became its seat of government. After becoming king in 1685, James II—determined to unite New York, New Jersey and the New England colonies—extended accordingly the authority of Andros, already viceroy of New England. In order to save their rights in the soil, the proprietors of East and West Jersey surrendered their claims to jurisdiction but were able to resume them again when Andros was seized by the people of Boston in April 1689 following the news of revolt against James II in England.

In April 1702 the proprietors transferred to the crown all of their rights of jurisdiction but retained their rights to the soil. The provinces of East and West Jersey were then united and governed as a royal province. Until 1738 New York and New Jersey had the same governor; thereafter each had its own. The legislature met alternately at Burlington and Perth Amboy until 1790 when Trenton became the capital. The first four decades under royal government were disturbed by friction between the assembly and the royal governors and by disputes with the proprietors and creditors, accompanied by rioting (1744–54, 1770).

Meanwhile significant innovations in religious outlook were developing in the state. David Brainerd, the Presbyterian missionary, from 1744 to 1747 devoted his life to ministry among the Indians. In 1770, under the instruction of Thomas Potter, the Rev. John Murray established in Ocean county the first Universalist church. Between 1743 and 1772 John Woolman, the Quaker tailor, of Mount Holly, aroused his contemporaries to concern over military conscription, the condition of the poor, the practices of landholders and traders and the inhumanity of slaveholding. Political and religious differences persisted between East Jersey, settled largely by Puritans from New England and Long Island, and West Jersey, settled by Quakers.

When, after 1763, England tried to consolidate its victory over France, the curtailment of paper money, the termination of trade with the West Indies and the inclusion of iron and lumber on the enumerated list stirred unrest. The colonial assembly of New Jersey dissolved in Nov. 1775. From May 26 to July 2, 1776, the second provincial congress met at Burlington, Trenton and New Brunswick, for a time became the supreme governing power and was the fourth assembly to enact a constitution, July 2, 1776. Distinguished for its bill of rights and the predominant position of the legislature, the constitution subordinated representation of population to that of counties and retained property qualifications for suffrage and office holding.

Important battles of the war were fought in New Jersey. Late in 1776 George Washington, commander in chief of the continental forces, unable longer to hold the lower Hudson, retreated to the Delaware near Trenton and, by commandeering all available boats, won for his dispirited troops the river as defense against their pursuers. Recrossing with 2,500 men on Dec. 25, he surprised three Hessian regiments next morning and took 1,000 prisoners and 1,000 stands of arms; outgeneralling Lord Cornwallis, he defeated a detachment of the British commander's army at Princeton on Jan. 3, 1777. The American army went into winter quarters near Morristown. (There, in 1950, a monument was dedicated to Thomas Paine, whose *American Crisis* had inspired the soldiers just before these two crucial battles and whose $500 "mite" in 1780 initiated the fund which relieved the distress of the army again encamped there.) As the British army was retreating from Philadelphia to New York, Washington's forces engaged it in the indecisive battle of Monmouth (June 28, 1778).

Released by the war from the century-old conflict over proprietary titles and quitrents and from the restraints of British mercantilism, New Jersey found its commercial existence threatened by New York city and Philadelphia, and joined movements for a closer federal union. Speaking for the smaller states which objected to representation in a national congress on the basis of wealth or population, one of the New Jersey delegates, William Paterson (1745–1800), presented to the federal convention at Philadelphia the "New Jersey plan" of union, representing the wishes of the smaller states, which objected to representation in a national congress being based on wealth or on population. This merely federal plan, reported from a conference attended by the delegates from Connecticut, New York and Delaware, as well as those from New Jersey (and by Luther Martin of Maryland), consisted of nine resolutions; the first was that "the Articles of Confederation ought to be so revised, corrected and enlarged as to render the federal Constitution adequate to the exigencies of government and the preservation of the Union"; and the actual "plan" was for a single legislative body, in which each state should be represented by one member, and which should elect the supreme court and have power to remove the executive (a council), to levy taxes and import duties, to control commerce, and even, if necessary, to make requisitions for funds to the states. James Madison opposed the plan on the ground that it would not prevent violations by the states of treaties and the laws of nations. On the first resolution only there was a definite vote; on June 19 it was voted to postpone the consideration of this resolution and to report the resolutions (the Virginia plan) formerly agreed upon by the committee of the whole. The New Jersey plan left its imprint in the provision of the constitution for equal representation in the national senate and for the supremacy of federal law. By unanimous vote the state convention at Trenton, summoned by unanimous vote of the legislature, on Dec. 18, 1787, became the third state to ratify the federal constitution. In 1801 Aaron Burr, who had been born in Newark, became vice-president of the United States.

On Aug. 22, 1787, John Fitch demonstrated on the Delaware the first steamboat (31 years later the Vail works near Morristown built the machinery for the "Savannah," the first steamboat to cross the Atlantic). In 1794, under the auspices of Alexander Hamilton's "Society for Establishment of Useful Manufactures," chartered by the legislature in 1791, a calico-printing factory inaugurated at the Great falls of the Passaic the first factory town in the U.S., now Paterson. In 1806 the first interstate railroad bridge was opened at Trenton. This material progress was interrupted by the War of 1812 which in the beginning was so unpopular, especially among the Quakers, that the Federalists carried the elections of 1812. After the war the construction of the Morris (1824–38) and the Delaware and Raritan (1826–38) canals and the completion of New Jersey's first railway, the Camden and Amboy (1834), provided facilities for a widespread industrial development.

Agitation for democratic reform culminated in a constitutional convention at Trenton (May 14–June 27, 1844) which drafted a new frame of government, ratified at the polls on Aug. 13. Thereby New Jersey abolished property qualifications for suffrage, modified the basis of representation in the assembly from county toward population, separated legislative, executive and judicial powers and provided for direct election of the governor. A major experiment in social organization, the North American Phalanx, flourished near Red Bank between 1844 and 1856.

Opinion was divided on the question of slavery. The underground railroad transported fugitives to freedom; but when the Civil War broke out, 18 people in New Jersey were legally still slaves. In 1860 three of the state's electoral votes went to Stephen Douglas and four to Abraham Lincoln. New Jersey was one of the three states which voted for Lincoln's opponent in 1864. It furnished 88,305 men for the Union cause and incurred extraordinary expenditures to the amount of $2,894,385. Ratifications of the 13th and 15th amendments were each first refused by the respective legislatures before being voted by their successors in which the Republican party had gained a majority; in 1868 the Democratic legislature sought in vain to withdraw the ratification of the 14th amendment voted by its Republican-controlled predecessor.

A bitter railway war followed the Civil War. The Pennsylvania railroad was charged with virtually monopolizing the route between New York city and Philadelphia as a result of a 999-year lease through which it had gained control of the properties of companies previously granted monopolistic privileges. In 1873 the state opened the route to other railroads.

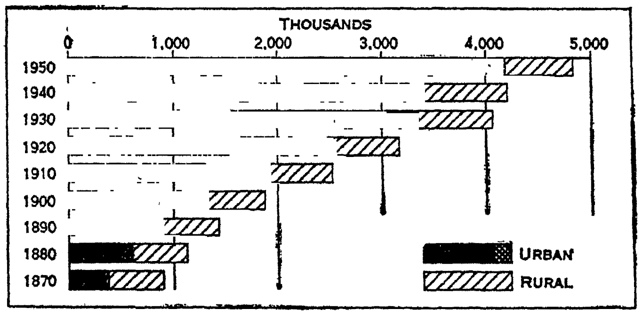
This same period was marked by great cultural, scientific and industrial development. Walt Whitman, in Camden (1873–92), was enlarging *Leaves of Grass*. George Inness, in Montclair and Perth Amboy, was bringing to his countrymen a new sensitivity for the landscape. From 1870 to 1931 in Newark, Menlo Park and West Orange, Thomas Edison was producing inventions evaluated in 1928 by the congress of the U.S. at $15,599,000,000 which included: the mimeograph, indispensable elements for the extensive use of telegraph (1874) and telephone (1876), the dynamo, the storage battery, the talking machine (1877), the incandescent lamp (1879), the electric railway (1880–82), the motion picture (1888–94). In 1881 John Holland launched in the Passaic river the first successful submarine. In 1891 Hudson Maxim demonstrated smokeless powder. With no limit fixed either to capitalization or to bonded indebtedness, with a policy of encouragement of the holding company structure, with a tax rate lower for large than for small corporations, by 1904 New Jersey had chartered 3 of the 7 largest trusts and had "mothered" 150 of the 298 next largest business organizations in the U.S. Growing concern over the effects of industrialism led to direct primaries (1907, 1911), a new ballot form (1911), the election of Woodrow Wilson as governor (1911–13) and the passage in 1913 of the "Seven Sisters" acts for eliminating the power of trusts to create monopoly, limit production,

fix prices and restrain trade. New laws limited public service franchises to 20 years, subject to municipal referendum.

Political power in New Jersey has usually been shared by the two major parties, but between 1914 and 1951 the Democrats never gained control of both houses of the legislature and only twice had control of either. After 1910 six of the nine governors elected were Democrats, as just half had been since the election of the first Republican in 1857. In the presidential elections from 1892 through 1948 the state voted Democratic in 1912 for Woodrow Wilson and in the four elections of Franklin D. Roosevelt.

Following popular rejection in 1944 of the draft constitution which the legislature had passed pursuant to a popular referendum in 1943, the convention, delegates to which had been popularly elected on June 3, 1947, assembled in New Brunswick on June 12. By Sept. 12 they had prepared the new constitution which on Nov. 2 the voters approved. On Jan. 1, 1948, consequently, New Jersey replaced its 103-year-old constitution. For the first time in more than 100 years the electorate in Nov. 1949 could re-elect a governor and for the first time in 40 years the Republicans held the governorship for two successive terms. Legislative sessions in 1948–51 enacted the basic measures for effecting the structural changes required under the new constitution.

Population.—The population of New Jersey in 1790 was 184,139; in 1830 it was 320,823; in 1870, 906,096; in 1910, 2,537,167; in 1940, 4,160,165; and in 1950, 4,835,329. This last figure represented an increase of 16.2% over the population in 1940. The population per square mile in 1950 was 642.8, as compared with 553.1 in 1940 and with 50.7 for the U.S. in 1950.



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEW JERSEY: 1870 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

The urban area of New Jersey in 1940 comprised all incorporated places of 2,500 or more plus 12 townships classified as urban under a special rule which counted as urban any township with a total population of 10,000 or more and a density of 1,000 persons or more per square mile. The population of this area was 3,394,773, or 81.6% of the state total. The population in 1950 of all incorporated places plus the 12 special-rule townships was 3,847,771, or 13.3% more than in 1940, and represented 79.6% of the state total.

TABLE I.—*Population of New Jersey and Its Principal Cities*

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40

*Final figures for 1950 based on new definition. *See* comment in text.

The entire urban population under a new definition set up for 1950, which included also the thickly settled suburban area, or "urban fringe," adjacent to the 13 cities which had a population of 50,000 or more in 1940, and 15 unincorporated places of 2,500 or more outside this fringe, amounted to 4,186,207 or 86.6% of the state total.

The number of households in 1950 was 1,374,422, as compared with 1,100,260 in 1940.

The average population per household had declined from 3.8 in 1940 to 3.5 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 80.3% native white; 13.0% foreign-born white; and 6.6% nonwhite, practically all Negro. There were 97.2 males per 100 females in the 1950 population, as compared with 99.0 in 1940; 8.1% of the population was 65 years old or over; and 55.8% of the population 14 years old and over was in the labour force.

Of the total number of employed males, 3.2% was engaged in agriculture, 8.6% in construction, 37.7% in manufacturing, 9.8% in transportation, communication and other public utilities; 18.3% in wholesale and retail trade and 16.6% in service activities of all kinds, including public administration.

Government.—Through the constitutions of 1776, 1844 and 1947, New Jersey moved from a government of legislative dominance to one of separation of powers and a strengthened executive. The third constitution was notable for changes in the bill of rights, the administration and the judiciary. For the first time a state granted women constitutional recognition of equal rights. Discriminatory treatment and segregation "because of religious principles, race, color, ancestry or national origins" was prohibited in the militia and public schools. (In 1948 the legislature vested in the division of civil rights responsibility for administering all protections of civil rights in education, health, recreation and public accommodations.) Labour was guaranteed the right to organize and bargain collectively. The suffrage is vested in all U.S. citizens, 21 years old and over, resident in the state for one year and in the county five months preceding the election.

The governor alone is chosen by state-wide electorate. Following a four-year term he may be re-elected but an interval of four years must elapse before further re-eligibility. If the governor dies, resigns or is removed from office, the president of the senate or the speaker of the assembly succeeds him. Since the executive departments were limited to 20, the legislature in 1948 consolidated more than 80 agencies into 13 departments, the heads of which the governor appoints with senate approval. He likewise appoints the chief justice and associate justices of the supreme court and judges of all other courts with jurisdiction extending to more than one municipality. The legislature appoints the auditor. Other appointments and promotions in the state and its subdivisions are subject to constitutional provision for competitive examinations and the merit principle.

The senate has 21 members, one for each county, chosen approximately one-half each biennium. The assembly has 60 seats apportioned according to population, provided that each county has at least one member (two-year term). The legislature meets annually. The governor may (from 1875) veto any item in appropriation bills. Two-thirds of all members in each house may override his veto. After 10 days during the session or 45 after adjournment, bills become law without his signature. Amendments to the constitution must first be passed either by three-fifths of all of the members of each house or in two successive legislative years by a majority of all of the members of each house, then ratified by a majority of the legally qualified voters voting thereon.

The American Judicature society in 1948 reported that the reorganized judiciary "attains most of the objectives for which (they) and others have contended for the past thirty-five years." The supreme court consisting of a chief justice and six associate justices has administrative direction over the superior court (not less than 24 members), the county courts and such courts as the legislature may establish. Reappointment of a member of the supreme or superior court after his initial seven-year term is for an indefinite period. Retirement at 70 is compulsory. The supreme

court replaced the court of errors and appeals. A superior court with appellate, chancery and law divisions replaced the chancery, supreme and circuit courts. County courts with law and probate divisions replaced courts of common pleas, oyer and terminer, quarter sessions and special sessions. Judges are appointed for five years. The legislature in 1948 retained the juvenile courts and the district courts of criminal jurisdiction, reorganized the district courts of civil jurisdiction and established municipal courts to replace the following courts: police, recorders, family, magistrates, justices of peace, city district and small cause. In place of the court of pardons, the governor alone grants pardons. The constitution provides that power of local government be liberally interpreted. A broader area of home rule became available under the Optional Charter act of 1950. First to form a commission for interstate co-operation (1935), New Jersey has a diversity of compacts with other states, and participates in the interstate agency, the Port of New York authority (1921).

Finances.—The division of taxation in the department of the treasury in 1948 superseded the department of taxation which in 1944 had replaced the state tax department (1931). The director supervises eight bureaus administering respectively the following taxes: motor fuels, public utility and local, cigarette, railroad, beverage, transfer inheritance, corporation, outdoor advertising. The net assessed valuation of real and personal property exclusive of bank and trust company stock in 1950 was $5,944,408,870. In the state fund, cash receipts for the year ending June 30, 1950, were $218,487,528 and disbursements $166,554,540. Bonded indebtedness on July 2 was $76,090,000, all in serial bonds.

TABLE II.—*Distribution of All Federal, State and Local Taxes in New Jersey, Exclusive of Pay Roll Taxes, 1948*
(amounts in thousands of dollars)

Source: Commission on State Tax Policy.

The distribution of total expenditures of state and local governments in 1949 was: state purposes, 20.5%; county, 16.8%; municipalities, 37.6%; school districts, 25.1%. Relying upon special taxes for general state purposes (in 1949, 73% from taxes on cigarettes, alcoholic beverages, pari-mutuel racing and inheritances), the state maintained the lowest per capita state tax collection. Local government services depended primarily upon the general property tax, assessed and administered locally, which in 1949 amounted to 66.8% of total state and local revenue. The tax policy commission (1945) issued in 1950 its fifth basic study on the tax position of the state.

Education.—A total of 699,076 pupils enrolled in public schools during 1948–49, an increase of 6,314 over 1947–48. Children of migratory workers were brought under the school law. Employment of a child under 16 years of age while public schools are in session is illegal. The high schools had 164,070 enrolled, with an average of more than 700 pupils per school. The school system included: 556 districts with 800 kindergartens, 1,544 elementary schools, 153 high schools of four years or less, 72 junior and 48 senior high schools; a school for the deaf at West Trenton and a manual training and industrial school at Bordentown; five junior colleges; teachers colleges at Trenton (1855), Upper Montclair (1908), Newark (1855), Paterson (1855), Glassboro (1917) and Jersey City (1929). Rutgers university (1766, New Brunswick) by legislative act in 1945 became the "state university." New Jersey College for Women, New Brunswick, affiliated with Rutgers, opened in 1918.

A 12-member board (six-year term) and a commissioner of education (five-year term) are responsible for elementary, secondary and vocational education, junior colleges, higher education, the state library, the state museum and the civil rights division. The total expense of maintaining the public day schools in 1948–49 was $140,667,766 or a yearly average per pupil in average day attendance of $251. The investment in school property averaged $670 per pupil. Salaries for teachers including superintendents, principals and supervisors totalled $95,408,953. Eighty-seven per cent of the total school income was derived from the local property tax.

The second oldest public library in the U.S. opened in Trenton in 1750, the third oldest high school, in Newark in 1838. The free public-school system was achieved in 1871.

The department supervised in 1950 the licensing of 300 private nursery, child care and kindergarten schools. Industrial schools in Newark, Hoboken and Trenton received some state aid. Roman Catholic elementary schools enrolled 129,399 and high schools, 22,286 in 1949. Four junior colleges operated under private auspices. Private institutions of higher education having 1,000 or more students are: Princeton university (1746, Princeton), Seton Hall university (1856, South Orange), Rider college (1865, Trenton), Stevens Institute of Technology (1870, Hoboken), Newark College of Engineering (1881, Newark), Upsala college (1893, East Orange), Fairleigh Dickinson college (1941, Rutherford). Among the theological seminaries in the state are: New Brunswick, oldest in the U.S. (1784, Dutch Reformed, New Brunswick), Princeton (1812, Presbyterian), Drew (1867, Methodist, Madison), Bloomfield (1868, Presbyterian, Bloomfield), Immaculate Conception (1927, Roman Catholic, Ramsey).

Public Welfare.—The following 20 institutions were co-ordinated in 1950 under the department of institutions and agencies: the Diagnostic centre at Menlo Park; the Arthur Brisbane Child Treatment centre at Allaire; mental hospitals at Trenton, Greystone Park and Marlboro; for the mentally deficient, homes at Vineland, New Lisbon, Woodbine and schools at Vineland and Totowa; the Glen Gardner Sanatorium for Tuberculous Diseases; a village for epileptics near Skillman; reformatories near Clinton and at Annandale and Bordentown; reform schools near Jamesburg and at Trenton; the state prison at Trenton and prison farms at Rahway and Leesburg; a home for disabled soldiers at Menlo Park and for disabled veterans and their families at Vineland; a firemen's home at Boonton. About 5.1% of the aged population received old-age assistance.

Agriculture.—With only 3.1% of its population (1945) engaged in agriculture, the state supplied its own food needs directly or by exchange of surpluses. Favourable climate, stretches of good soil, heavy fertilization, abundant water supply for canneries, deep freezes and dehydrating plants, an unparalleled market easily accessible, the development of farmer-owned marketing co-operatives under state supervision kept agriculture a major industry in 14 of the 21 counties. The 26,226 farms in 1945 (84.4% owner-operated) comprised 1,818,103 ac. and were valued at $292,980,843. The average size of a farm in 1945 was 69.3 ac. and the average value per acre was $161.15; in 1948 the gross average cash income per farm was $12,370. During 1912–50 the index of estimated value of farm real estate rose for New Jersey 97%. Receipts from farm marketings in 1948 were distributed as follows: livestock and products, 58%; crops, 41%; government payments, 0.3%. Among the state's agricultural products in 1950 having a total value of $311,473,000, eggs led ($77,154,000) and with poultry meat ($24,200,000) contributed nearly 33% of the total value of farm products. Of the 14,634,000 chickens on farms, 9,930,000 were layers. Milk, second in value, brought $61,600,000. The average value per head of cattle was $285. The third most valuable agricultural commodity was vegetables. Grains, valued at $21,800,000, during 1943–50 displaced nurseries ($17,500,000) for fifth place. Compared with an average of 803,000 ac. in 1939–48, 799,000 ac. were harvested in 1950, of which 260,000 yielded 467,000 tons of hay, 177,000 ac., 9,588,000 bu. of corn; 78,000 ac., 1,677,000 bu. of wheat; 44,000 ac., 12,980,000 bu. of white potatoes (7,439,827 bu. in 1940). Of livestock having a value exceeding

$1,000,000 on Jan. 1, 1950, there were: all cattle, 228,000 ($63,-156,000); milch cows, 164,000 ($55,760,000); hogs, 69,000 ($2,-242,000); chickens, 14,636,000 ($30,000,000). The agricultural experiment station (1880), under Rutgers college (from 1924, Rutgers university), and the extension service (1912) fostered scientific agriculture. By 1949 New Jersey was one of eight states completely covered by soil conservation districts.

Manufacturing.—Of the total income in 1948, 34.4% came from manufacturing pay rolls. With resources of timber, sand, clays, copper and iron, New Jersey early developed shipbuilding, brick, terra cotta, pottery (*c.* 1684) industries, iron (1676), copper and glass (1740) works. The water resources of deep rivers, protected harbours, falls, canals and subsoil reserves aided industry in achieving that dominance which it held after 1880. Location in the centre of the commercial, financial and industrial region from Boston to Baltimore having 25,000,000 people and 23% of the national income, together with a growing market within the state (retail sales aggregated, in 1948, $4,470,800,000) encouraged industries which require cheap transportation and easy access to large markets.

TABLE III.—*Leading Industries of New Jersey, 1950*

Industry	Wage earners	Value in dollars
Chemicals and allied products	59,760	744,601,000
Electrical machinery	70,867	393,992,000
Food and kindred products	35,803	354,821,000
Machinery (except electrical)	51,761	334,610,000
Textile-mill products	56,734	326,239,000
Apparel and related products	65,694	252,037,000
Transportation equipment	34,490	221,725,000
Primary metal industries	33,013	216,426,000
Petroleum and coal products	13,307	212,807,000
Paper and allied products	18,086	154,568,000

In production of chemicals New Jersey led the U.S. and employed 13.1% of all in that industry. Of its 148,000 business establishments in 1950, 10,755 were manufacturing concerns which added $4,177,080,000 in the process of manufacturing (5.6% of U.S. total). Wages paid to 601,748 employees amounted to $1,-644,207,000. Aided by a high proportion of war-supply contracts, by 1947 New Jersey had risen from an industrial rank of seventh in 1939 to sixth place among the states. During 1939–50, however, its rate of expansion fell relative to that of the U.S.: number of establishments in the U.S. increased 30.7%, in New Jersey 25.7%; average number of wage earners in U.S. 51%, in New Jersey 38.8%; total wages in U.S. 232.7%, in New Jersey 215.4%; value added by manufacture in U.S. 201.5%, in New Jersey 174.1%. Employees were about equally distributed, in 1948, among durable goods industries (45.9%) and nondurable (48.9%). The chief manufacturing centres were Newark, Jersey City, Camden, Trenton, Bayonne and Paterson. The succession of inventors who enlarged the economic life of the state included John Fitch, John Stevens and his son Robert, Seth Boyden, John Wesley Hyatt, Hannibal Goodwin, Hudson Maxim and, most prolific of all, Thomas A. Edison. In a basement laboratory Allan B. DuMont of Upper Montclair developed the cathode ray television tube which led to his first experimental telecasts in 1938 and first commercial television station in 1948.

Labour.—New Jersey labour played a leading part in the establishment of the Knights of Labor (Uriah Smith Stevens, 1869), Labor day (Peter J. Maguire) and the events culminating in the Congress of Industrial Organizations. The oldest recorded strike in the U.S. occurred in 1828 in the Paterson cotton mills; for the first time the workers in the U.S. faced the state militia. New Jersey was the first state to enact maximum hour (1892) and employer liability laws (1911) and the third state to enact full workmen's compensation coverage (1949). A labour-management institute was established at Rutgers university by legislative act (1947) to enlist co-operation between the public, unions and management in basic research in industrial relations. In New Jersey the American Federation of Labor had its greatest strength in electrical, chauffeurs and teamsters, building constructing, culinary alliance, ladies' garment and chemical trades. C.I.O. strength lay especially in textiles, steel, automobile, electrical and radio machinery and rubber industries.

Minerals.—With a total value of $51,092,000 in 1948, mineral products included: zinc (76 short tons) $20,710,000; clay products (other than potteries and refractories) $8,149,000; sand and gravel, $7,490,000; limestone and sandstone for buildings and traprock for road construction, $6,376,000. The extraction and processing of iron ore in New Jersey, beginning about 1675, became a major support for the Revolutionary armies and the chief industry of the state by 1850; it declined in relative importance, however, after the Civil War. The 448,489 long tons produced in 1949 had a value of $4,468,575 or 11.6% of the total value of minerals produced in that year ($38,584,000).

Transportation.—Railways reaching New York city directly from the south and west and reaching Philadelphia from the north and east cross the state. Except for the Pennsylvania railroad, these lines have their terminals on the west bank of the Hudson in Jersey City, Hoboken or Weehawken, whence passengers and freight are ferried to New York. Electric railway tunnels under the Hudson connect Hoboken and Jersey City with New York; the latter have additional connections through the Holland and Lincoln tunnels. The 2,011 mi. of railroads (Dec. 31, 1948), 1,771 mi. of state highways, 6,556 mi. of county and 19,663 mi. of municipal roads and streets carry daily 1,000 passenger and 300 freight trains and the traffic of 1,440,773 automobiles, buses and trucks. Of the vehicles using the highways, streets and roads, the highway department estimated passenger cars at 79.4%, trucks at 19.7% and buses at 0.9% (1949). The New Jersey Turnpike authority (1948) undertook completion of New Jersey's part in an express highway to connect New York city with Washington, D.C.

The Newark airport, earliest major air terminal in the U.S., and that at Teterboro, which in 1948 and 1949 respectively came under the Port of New York authority, are the two best-known of New Jersey's 94 airports, 12 of which were commercial, 68 municipal and 5 military.

A great volume of water-borne commerce clears annually through the ports of Hoboken, Jersey City, Bayonne, Newark, Perth Amboy and Paulsboro.

BIBLIOGRAPHY.—For descriptive material *see* bibliographies in *Bulletins* no. 177 and 301 of the United States Geological Survey; the *Annual Reports* and especially the *Final Report* of the New Jersey Geological Survey; and the *Annual Reports of the New Jersey State Museum.* For population, occupations, etc., *see* the volumes of the 16th U.S. Census and the reports of the 17th (prior to March 15, 1951; the biennial Census of Manufactures; the *Year Book* of the U.S. Department of Agriculture; Homer Hoyt, *An Economic Survey of New Jersey* (1950). History: The most important sources are: D. G. Brinton, *The Lenape and their Legends* (1885); J. F. Jameson (ed.), *Narratives of New Netherland 1609–1664* (1909); Albert Cook Myers, *Narratives of Early Pennsylvania, West New Jersey and Delaware, 1630–1707* (1912); New Jersey Historical Society, *New Jersey Archives,* 41 vol. (1880 *et seq.*); *see* also the *Collections* and other publications of the New Jersey Historical Society.

Among valuable secondary accounts of the early period are: L. B. O'Callaghan, *History of New Netherland* (1846); John Romeyn Broadhead, *History of the State of New York* (2nd vol. 1853, 1871).

Extensive classified bibliographies have been published in: Federal Writers' Project of WPA, *New Jersey* in the "American Guide Series" (1939); New Jersey Department of Public Instruction, *New Jersey, Its History, Resources, and Life* (1940); New Jersey History Committee, *Outline History of New Jersey* (1950). (N. W. B.)

NEW JERSEY TEA (*Ceanothus americanus*), a North American shrub of the buckthorn family (Rhamnaceae), called also redroot, native to dry open woods and gravelly banks from Maine to Manitoba and southward to Florida and Texas. Its low, branching stems, one to three feet high, which spring from a dark red root, bear ovate, three-ribbed, somewhat downy, toothed leaves and attractive white flowers in umbel-like clusters. During the Revolutionary War the leaves were used as tea. (*See* CEANOTHUS.)

NEW JERUSALEM CHURCH or NEW CHURCH, the community founded by the followers of Emmanuel Swedenborg (*q.v.*). Swedenborg himself took no steps to found a church, but

having given a new interpretation of Scripture, it was inevitable that those who accepted his doctrine should separate themselves and organize a society in accordance therewith. Those who received them fully during Swedenborg's lifetime were few and scattered, but courageously undertook the task of dissemination, and gave themselves to translating and distributing their master's writings. Two Anglican clergymen were conspicuous in this work: Thomas Hartley (d. 1784), rector of Winwick, and John Clowes (1743–1831), vicar of St. John's, Manchester. Hartley translated *Heaven and Hell* (1778) and *True Christian Religion* (1781); Clowes, who taught New Church doctrine in the existing churches and was opposed to the forming of new organizations, translated 17 volumes, including the *Arcana Coelestia*, and published more than 50 volumes of exposition and defense. Through his influence Lancashire became the stronghold of the Swedenborgians.

In 1782 a society for publishing Swedenborg's writings was formed in Manchester, and in Dec. 1783 a little company of sympathizers with similar aims met in London and founded the Theosophical society, among the members of which were John Flaxman the sculptor, William Sharpe the engraver and F. H. Barthélemon the composer. In the early days most of them worshipped at the Female Orphan asylum, St. George's, whose chaplain, Rev. Jacob Duche, like Clowes at Manchester, preached the doctrines from his own pulpit.

In 1785 and 1787 J. W. Salmon and R. Mather conducted an open-air missionary tour in the midlands and the north with some success. Five prominent Wesleyan preachers adopted the new teaching and were cut off from their connection, a step which led, in spite of remonstrance from Clowes and others, to the formal organization of the New Jerusalem Church on May 7, 1787.

The first organized congregation of Swedenborgians met in a church in Great Eastcheap in Jan. 1788; and in April 1789 a general conference of British Swedenborgians was held in Great Eastcheap church, followed by another and by the publication of a journal, the *New Jerusalem Magazine*, in 1790. In the provinces the first church was at Birmingham (1791), followed by one at Manchester and another at Liverpool (1793). The Accrington church, the largest in Great Britain, was founded in 1802. Many of the early converts to the New Church were among the most fervent advocates of the abolition of slavery, one was the medical officer of the first batch of convicts sent to Botany Bay.

In 1815 the conference took up the question of home missionary work, and its agents were able to found many branches of the church. In 1813 the Manchester and Salford (now the North of England) Missionary society was founded, chiefly to provide preachers for the smaller churches in its area; in 1857 a National Missionary institution was founded and endowed, to which most of the local ones became affiliated. Other denominational agencies have been concerned with the printing and circulation of Swedenborgian literature, a training college for the ministry (founded in 1852), and a Ministers' Aid fund (1854), and an orphanage (1881). The constitution of the New Church is of the Independent Congregational type; the conference may advise and counsel, but cannot compel the obedience of the societies. Returns for 1928 showed 70 societies with about 6,300 members.

The New Church in Europe.—In Sweden the Philanthropic Exegetic society was formed by C. F. Nordenskiold in 1786 to collect documents about Swedenborg and to publish his writings. The introduction of alchemy and mesmerism led to its dissolution in 1789, but its work was continued by the society "Pro fide et charitate," which existed from 1796 to 1820. For many years the works of Swedenborg and his followers were proscribed, and receivers of his writings fined or deprived of office, but in 1866, when religious liberty had made progress, the cause was again taken up; in 1875 the society of "Confessors of the New Church" was formed in Stockholm, and propaganda has been carried on in most of the towns of Sweden, as also in Norway and Denmark. In Germany the great name is that of Immanuel Tafel (d. 1863), librarian of Tübingen, who not only edited, translated and published, but in 1848 founded a "Union of the New Church in Germany and Switzerland" which held quarterly meetings. In Switzerland, on the contrary, there is an organized body of the New Church. In France about 1838 J. F. E. Le Boys de Guays began his masterly translation of all Swedenborg's theological works; and nearly every European country has some known adherents.

In America.—About 1784 James Glen, a London Scot, delivered lectures in Philadelphia and Boston and circulated some of Swedenborg's works. Francis Bailey, state printer of Pennsylvania, was attracted by them and became active in their promulgation. During the next ten years a number of prominent men gave their support to the teaching, which spread inland and southward.

The first society for worship was formed in Baltimore, Md., in 1792 (reorganized 1798), though a short-lived one had preceded it at Halifax, N.S., in 1791. Other churches grew up in Philadelphia, Cincinnati, Boston and New York, and the general convention, which later met annually, was formed at Philadelphia in 1817.

In Australia, etc.—The formation of societies in Australia began at Adelaide in 1844. Melbourne and Sydney followed in 1854, Brisbane in 1865. New Zealand has a church at Auckland (1883). Mission churches have been established in Japan, the Philippine Islands and British Guiana; and in 1910 David W. Mooki organized a church for the natives of South Africa.

See L. P. Mercer, *The New Jerusalem in the World's Religious Congresses of 1893; Minutes of the General Conference of the New Church* (annual); *Journal of the Annual Session of the General Convention of the New Jerusalem in the United States of America.*

NEW KENSINGTON, a third-class city of Westmoreland county, Pennsylvania, U.S., on the Allegheny river and the Pennsylvania railroad, 18 mi. N.E. of Pittsburgh. Pop. 25,146 in 1950; in 1940 it was 24,055 by the federal census. It is a coal mining centre, and has important manufactures (including aluminum, glass, malleable iron and car springs, conduits, plastics and textiles).

The borough was founded in 1891, incorporated in 1892 and took on a city status in 1930.

NEWLANDS, JOHN ALEXANDER REINA (1838–1899), English chemist, was born in 1838.

He was one of the first to propound the conception of periodicity among the chemical elements. His earliest contribution to the question took the form of a letter published in the *Chemical News* in Feb. 1863. In the succeeding year he showed, in the same journal, that if the elements be arranged in the order of their atomic weights, those having consecutive numbers frequently either belong to the same group or occupy similar positions in different groups, and he pointed out that each eighth element starting from a given one is in this arrangement a kind of repetition of the first, like the eighth note of an octave in music.

The law of octaves thus enunciated was at first ignored or treated with ridicule as a fantastic notion unworthy of serious consideration, but the idea, subsequently elaborated by D. I. Mendeleyev (*q.v.*) and other investigators of the periodic law, took its place as an important generalization in modern chemical theory.

Newlands was of Italian extraction on his mother's side, and fought as a volunteer in the cause of Italian freedom under Giuseppe Garibaldi in 1860. He died in London on July 29, 1898.

He collected his various papers on the atomicity of the elements in a little volume on the *Discovery of the Periodic Law* published in London in 1884.

NEW LONDON, a city of southeastern Connecticut, U.S., on the west bank of the Thames river, at its junction with Long Island sound, and a port of entry. It is on federal highway 1 and is served by the Central Vermont and the New York, New Haven and Hartford railways. Pop. (1950) 30,551 (about 80% native white); in 1940 it was 30,456 by federal census. The city lies on sloping ground which commands wide views of the sound and the surrounding country from its higher points, and has a fine natural harbour.

At the entrance to the harbour, on either side of the river, stand Fort Trumbull and Fort Griswold, which during the American Revolution guarded the approach to the harbour. New London was a rendezvous for privateers during the Revolutionary War and the first naval expedition was organized in its harbour in 1776. In 1781 New London was nearly totally destroyed by fire at the

hands of the British, but a new community replaced the older settlement. There are many piers and wharves along the harbour including a state pier more than 1,000 ft. long with depressed railroad tracks.

New London was founded in 1646 by John Winthrop the younger. In 1658 the modern name was substituted for the original Indian name "Nameaug," and the Pequot or Monhegin river became the Thames. The city was incorporated in 1784. In the 18th century New London had a large trade with the West Indies, Gibraltar and the Barbary states but this declined after the War of 1812. It was also an important whaling and sealing port.

The Connecticut College for Women, United States Coast Guard academy, Admiral Billard academy and Mitchell college are located there. The city is a seaside summer resort and the home of several yacht clubs. Among points of special interest are the old town mill (1650), Shaw mansion, Hempsted house (1678), Huguenot house (*c.* 1759), New London County courthouse (1784), Ye Ancientest Burial Place (1653), the Whaling Museum and the Nathan Hale school.

Industrial production includes tools, turbines, textiles, printing presses, cigarette papers, paper boxes, machines, radio and television receiving sets, collapsible tubes, chucks and gears, wood products and chemicals

NEW LONDON, a city of Wisconsin, U.S., on the Wolf river, in Outagamie and Waupaca counties. It is on federal highway 45 and is served by the Chicago and North Western and the Green Bay and Western railways. Pop (1950) 4.922. It is a dairying region and has various manufacturing industries.

NEW MADRID, a city and the county seat of New Madrid county, Mo., U.S., on the right bank of the Mississippi river, about 35 mi. S. by W. of Cairo, Ill. Pop. (1950) 2,726; (1940) 2,450. It is served by the St. Louis Southwestern railway and by river barges. The city is a shipping point for a rich grain, cotton, livestock and lumber region. Among its manufactures are lumber and lumber products. The municipality owns its waterworks.

Because of the encroachments of the Mississippi river, the site of the first permanent settlement of New Madrid is said to lie now about 1½ mi. from the east bank of the river, in Kentucky. This settlement was made in 1788, on an elaborately laid out townsite, and was named New Madrid by its founder, Col. George Morgan (1742–1810), who, late in 1787, had received a grant of a large tract of land on the right bank of the Mississippi river from Don Diego de Gardoqui, Spanish minister to the United States. The tract lay within the province of "Louisiana," and the grant to Morgan was a part of Gardoqui's plan to annex to that province the western American settlements. Earthquake shocks in 1811 and 1812 caused a general emigration.

New Madrid was occupied by Confederate troops under Gen. Gideon J. Pillow, on July 28, 1861, and after the surrender of Fort Donelson (Feb. 16, 1862) the troops previously at Columbus, forming the Confederate left flank, were withdrawn to New Madrid and Island No. 10 (in the Mississippi about ten miles south). Early in March, Maj. Gen. John Pope and Commodore A. H. Foote proceeded against the positions on the left bank; New Madrid, then in command of Gen. John P. McGown, was evacuated on the 14th; Adm. Henry Walke (1808–96), commanding the "Carondelet," ran past the batteries of Island No. 10 and the shore batteries on April 4, and Lieut. Com. Egbert Thompson, commanding the "Pittsburgh," on the 7th; meanwhile the Federals under the direction of Col. Josiah W. Bissell (b. 1818), of the engineer corps, had, with great difficulty, constructed an artificial channel to New Madrid across the peninsula (swamp land) formed by a great loop of the Mississippi; troops were conveyed by transports through this channel below the island, Federal batteries having been established on the right bank of the river; the retreat of the Confederates downstream was effectually blocked; they evacuated the island on April 7, and on the 8th the garrison and the forces stationed in the shore batteries, a total of about 7,000, under Gen. W. W. Mackall, was surrendered at Tiptonville.

NEWMAN, FRANCIS WILLIAM (1805–1897), English scholar and miscellaneous writer, younger brother of John Cardinal Newman, was born in London on June 27, 1805. He was educated at Ealing, and at Oxford, where he was elected fellow of Balliol in 1826. Conscientious scruples respecting the ceremony of infant baptism led him to resign his fellowship in 1830, and he went to Baghdad as assistant in the mission of the Rev. A. N. Groves. In 1833 he returned to England on behalf of the mission, but finding himself suspected of heterodoxy, he became classical tutor in an unsectarian college at Bristol. In 1846 he became professor in University college, London, where he remained until 1869. In 1847 he published anonymously a *History of the Hebrew Monarchy.* In 1849 appeared *The Soul, her Sorrows and Aspirations,* and in 1850, *Phases of Faith, or Passages from the History of my Creed*—the former a tender but searching analysis of the relations of the spirit of man with the Creator; the latter a religious autobiography detailing the author's passage from Calvinism to pure theism. It is on these two books that Newman's fame rests, though he was a versatile writer on many subjects. He wrote on logic, political economy, English reforms, Austrian politics, Roman history, diet, grammar, the most abstruse departments of mathematics, Arabic, the emendation of Greek texts, and languages as out of the way as the Berber and as obsolete as the dialect of the Iguvine inscriptions. In treating all these subjects he showed signal ability but, wherever the theme allowed, an incurable "crotchetiness"; and in his numerous metrical translations from the classics, especially his version of the *Iliad,* he betrayed an insensibility to the ridiculous.

His character was vividly drawn by Thomas Carlyle in his life of John Sterling, of whose son Newman was guardian: "a man of fine attainments, of the sharpest-cutting and most restlessly advancing intellect and of the mildest pious enthusiasm." It was his great misfortune that this enthusiasm should have been correlated, as is frequently the case, with an entire insensibility to the humorous side of things.

His last publication, *Contributions chiefly to the Early History of Cardinal Newman* (1891), was severely criticized. He died at Weston-super-Mare on Oct. 7, 1897. *See* T. G. Sieveking, *Memoir and Letters of Francis W. Newman* (1909).

NEWMAN, JOHN HENRY (1801–1890), English cardinal and leader of the Tractarian movement, was born in London on Feb. 21, 1801, the eldest son of John Newman, banker, of the firm of Ramsbottom, Newman and company. At the age of seven Newman was sent to a private school conducted by Dr. Nicholas at Ealing.

At the age of 15 he was conscious of an "inward conversion," an incident which throughout life remains "more certain than that he had hands or feet." In 1816 he matriculated at Trinity college, Oxford.

After graduation in 1821 he took pupils and read for a fellowship at Oriel, to which he was elected in 1822. Two years later he was ordained in the Anglican ministry and became curate of St. Clement's, Oxford. For a year he was vice-principal of the St. Alban's hall, but in 1826 he became tutor at Oriel. In 1827 he was appointed vicar of St. Mary's (to which was attached the chapelry of Littlemore) and in 1831–32 was select preacher before the university.

In 1832 a difference with Edward Hawkins, provost of Oriel, on the "substantially religious nature" of a tutorship, led to his resignation from that post. He then went for a tour on the Mediterranean with R. H. Froude, but at that time was still strongly Protestant in his views, as his comments on his stay in Rome show. During this tour he wrote many of the poems in the *Lyra Apostolica,* and "Lead, Kindly Light."

Tractarian Movement.—He was at home again in Oxford on July 9, 1833, and on the 14th John Keble preached at St. Mary's an assize sermon on "National Apostasy," which Newman afterward regarded as the inauguration of the Oxford movement. In the words of Dean Church, it was "Keble who inspired, Froude who gave the impetus and Newman who took up the work"; but the first organization of it was due to H. J. Rose, editor of the *British Magazine,* who has been styled "the Cambridge originator of the Oxford movement." It was in his rectory at Hadleigh, Suffolk, that a meeting of High Church clergymen was held, July 25–29 (Newman was not present), at which it was resolved

to fight for "the apostolical succession and the integrity of the Prayer-Book." A few weeks later, Newman started, apparently on his own initiative, the *Tracts for the Times,* from which the movement was subsequently named "Tractarian." Its aim was to secure for the Church of England a definite basis of doctrine and discipline, in case either of disestablishment or of a determination of High Churchmen to quit the establishment. The teaching of the tracts was supplemented by Newman's Sunday afternoon sermons at St. Mary's, the influence of which was very great during the next eight years. In 1835 Pusey joined the movement, which, so far as concerned ritual observances, was later called "Puseyite"; and in 1836 its supporters secured further coherence by their united opposition to the appointment of Hampden as regius professor of divinity. His Bampton lectures (in the preparation of which Blanco White had assisted him) were suspected of heresy, and this suspicion was accentuated by a pamphlet put forth by Newman, *Elucidations of Dr. Hampden's Theological Statements.*

At this date Newman became editor of the *British Critic,* and he also gave courses of lectures in a side chapel of St. Mary's in defense of the *via media* of the Anglican Church as between "Romanism" and popular Protestantism. His influence in Oxford was supreme about the year 1839, when, however, his study of the monophysite heresy first raised in his mind a doubt as to whether the Anglican position was really tenable on those principles of ecclesiastical authority which he had accepted; and this doubt returned when he read, in Wiseman's article in the *Dublin Review* on "The Anglican Claim," the words of St. Augustine against the Donatists, *securus iudicat orbis terrarum,* words which suggested a simpler authoritative rule than that of the teaching of antiquity. He continued his work, however, as a High Anglican controversialist until he had published, in 1841, *Tract 90,* the last of the series, in which he put forth, as a kind of proof charge, to test the tenability of all Catholic doctrine within the Church of England, a detailed examination of the XXXIX Articles, suggesting that their negations were not directed against the authorized creed of Roman Catholics, but only against popular errors and exaggeration. This theory, though not altogether new, aroused much indignation in Oxford, and, at the request of the bishop of Oxford, the publication of the *Tracts* came to an end. At this date Newman also resigned the editorship of the *British Critic,* and was thenceforth, as he himself later described it, "on his deathbed as regards membership with the Anglican Church." He now concluded that the position of Anglicans was similar to that of the semi-Arians in the Arian controversy; and the arrangement made at this time that an Anglican bishopric should be established in Jerusalem, the appointment to lie alternately with the British and Prussian governments, was to him further evidence of the nonapostolical character of the Church of England. In 1842 he withdrew to Littlemore, and lived there under monastic conditions with a small band of followers, their life being one of great physical austerity as well as of intense reflection and prayer. To his disciples there he assigned the task of writing lives of the English saints, while his own time was largely devoted to the completion of an essay on the development of Christian doctrine, by which principle he sought to establish the identity of the teachings of the Christian Church throughout the centuries with those of the Roman Catholic Church. In Feb. 1843 he published, as an advertisement in the *Oxford Conservative Journal,* an anonymous but otherwise formal retractation of all the hard things he had said against Rome; and in September, after the secession of one of the inmates of the house, he preached his last Anglican sermon at Littlemore and resigned the living of St Mary's.

Reception into the Catholic Church.—But still an interval of two years elapsed before he was formally received into the Roman Catholic Church (Oct. 9, 1845) by Father Dominic, an Italian Passionist. In Feb. 1846 he left Oxford for Oscott, where Bishop Wiseman, then vicar-apostolic of the Midland district, resided; and in October he proceeded to Rome, where he was ordained priest. Four years later, he was given the degree of D.D. by the pope, *honoris causa.* At the close of 1847 he returned to England as an Oratorian, and resided first at Maryvale (near Oscott); then at St. Wilfrid's college, Cheadle; then at St. Ann's, Alcester street, Birmingham; and finally at Edgbaston, where spacious premises were built for the community, and where (except for four years in Ireland) he lived a secluded life for nearly 40 years. Before the house at Edgbaston was occupied he had established the London Oratory, with Father Faber as its superior. In 1850, at the Corn exchange in Birmingham, he delivered a course of lectures on "The Present Position of Catholics in England," in the fifth of which he protested against the anti-Catholic utterances of Dr. Achilli, an ex-Dominican friar, whom he accused in detail of numerous acts of immorality. Popular Protestant feeling ran very high at the time, partly in consequence of the recent establishment of a Roman Catholic diocesan hierarchy by Pius IX, and criminal proceedings against Newman for libel resulted in an acknowledged gross miscarriage of justice. He was found guilty, and was sentenced to pay a fine of £100, while his expenses as defendant amounted to about £14,000, a sum that was at once raised by public subscription, a surplus being spent on the purchase of Rednall, a small property on the Lickey hills, with a chapel and cemetery, where Newman is buried.

In 1854, at the request of the Irish bishops, Newman went to Dublin as rector of the newly-established Catholic university there. But conditions were not favourable and complications became so great that after four years he retired, the happy outcome of his stay there being a volume of lectures entitled *Idea of a University,* containing some of his most effective writing. In 1858 he projected a branch house of the Oratory at Oxford; but this was opposed by Manning and others, as likely to induce Catholics to send their sons to that university, and the scheme was abandoned. In 1859 he established, in connection with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the English public schools, an important work in which he never ceased to take the greatest interest. But all this time (since 1841) Newman had been under a cloud, so far as concerned the great mass of cultivated Englishmen, and he was now awaiting an opportunity to vindicate his career. In 1862 he began to prepare memoranda for the purpose.

Works.—The occasion came when, in Jan. 1864, Charles Kingsley, reviewing Froude's *History of England* in *Macmillan's Magazine,* incidentally asserted that "Father Newman informs us that truth for its own sake need not be, and on the whole ought not to be, a virtue of the Roman clergy." After some preliminary sparring between the two, Newman published, in weekly parts, his *Apologia pro vita sua,* a religious autobiography of unsurpassed interest, the simple confidential tone of which "revolutionized the popular estimate of its author," establishing the strength and sincerity of the convictions which had led him into the Roman Catholic Church.

In 1870 he put forth his *Grammar of Assent,* the most closely reasoned of his works, in which the case for religious belief is maintained by arguments differing somewhat from those commonly used by Catholic theologians; and in 1877, in the republication of his Anglican works, he added to the two volumes containing his defense of the *via media* a long preface and numerous notes in which he criticized and replied to sundry anti-Catholic arguments of his own in the original issues. At the time of the Vatican Council (1869–70) he thought the time inopportune for a definition of Papal infallibility, and in a private letter to his bishop (Ullathorne), surreptitiously published, he denounced the "insolent and aggressive faction" that had pushed the matter forward. But he made no sign of disapproval when the doctrine was defined, and subsequently, in a letter nominally addressed to the duke of Norfolk on the occasion of Mr. Gladstone's accusing the Roman Church of having "equally repudiated modern thought and ancient history," Newman affirmed that he had always believed the doctrine, and had only feared the deterrent effect of its definition on conversions on account of acknowledged historical difficulties.

In 1878 his old college (Trinity), to his great delight, elected him an honorary fellow, and he revisited Oxford after an interval of 32 years. At the same date died Pius IX. His scholarly suc-

cessor and illustrious patron of education, Leo XIII, was encouraged by the duke of Norfolk and other distinguished Roman Catholic laymen to make Newman a cardinal, the distinction being a marked one, because he was a simple priest and not resident in Rome. The offer was made in Feb. 1879, and the announcement of it was received with universal applause throughout the English-speaking world. The "creation" took place on May 12, with the title of St. George in Velabro, Newman taking occasion while in Rome to insist on the lifelong consistency of his opposition to "liberalism in religion." After an illness that excited apprehension he returned to England, and thenceforward resided at the Oratory until his death, Aug. 11, 1890, making occasional visits to London, and chiefly to his old friend, R. W. Church, dean of St. Paul's, who as proctor had vetoed the condemnation of *Tract 90* in 1841.

Newman's influence as controversialist and preacher was very great. Some hundreds of clergymen, influenced by the Tractarian movement of which for 10 or 12 years he was the acknowledged leader, made their submission to the Church of Rome. And the influence continued to be felt. Practically all English converts since 1845 partly attribute their conversion to Newman. Newman's works were translated into several European languages. The accompanying schools of thought, the "Credo in Newmanum," were especially characteristic of France and Germany before Sept., 1939. The attempts of the "Modernists" to make a protagonist of Newman failed, as is evident from Pius X's letter to Bishop O'Dwyer and from the tribute paid to Newman by Pius XI. Many anthologies from his writings appeared, especially in the United States, where, too, a large number of societies, etc., were named in his honour. Several of his works were edited for collegiate study, and similarly his sermons as homiletical models. Passages from his devotional writings were adapted to the form of petition and published as Newman prayerbooks. A movement was started to promote his being declared "Venerable," the first process towards canonization. Newman had a vivid sense of man's personal relationship with God. As he expressed it . . . "alone with the Alone," two beings in all creation, God and himself. All else was a reflection of the Supreme Being. His sincerity of purpose was acknowledged by the English people slowly but in the end generously, in their happiness over his being chosen a cardinal. He was a man of magnetic personality, with an intense belief in the apostleship of his own career; and his character may be described as strong, with an almost feminine sensitiveness to impressions. As a poet he had inspiration and genuine power. "The Dream of Gerontius" is generally recognized as a masterpiece. His prose style is fresh and vigorous.

There is at Oxford a bust of Newman by Woolner. His portrait by Ouless is at the Birmingham Oratory, and his portrait by Millais is in the possession of the duke of Norfolk, a replica being at the London Oratory. Outside the latter building, facing Brompton road, is a marble statue of Newman as cardinal.

Bibliography.—The early authorities for Newman's life are his *Apologia* and the *Letters and Correspondence* edited by Miss Mozley. The letters and memoranda dealing with the years 1845–90 were entrusted by Newman to the Rev. W. Neville as literary executor. These were used in the authoritative work, *The Life of John Henry Cardinal Newman*, 2 vol. (1912; 3rd ed., 1927), by W. P. Ward. T. Mozley, *Reminiscences chiefly of Oriel College, and the Oxford Movement*, 2 vol. (1882); R. W. Church, *The Oxford Movement, Twelve Years, 1833–1845* (1891); and R. H. Hutton, *Cardinal Newman* (1891), should be consulted. *See* also *Cardinal Newman's Works*, 40 vol. (with index by J. Rickaby, 1874–1921); P. Thureau-Dangin, *La Renaissance Catholique en Angleterre au XIXe siècle*, 3 pt. (1899–1906; trans. and rev. by W. Wilberforce, 2 vol., 1914); L. Leslie, "Cardinal Newman," in *Great Catholics*, ed. C. C. H. Williamson (1938); C. F. Harrold (ed.), *A Newman Treasury* (1943). Adverse criticism will be found in the writings of E. A. Abbott (*e.g.*, *The Anglican Career of Cardinal Newman*, 1892).

(A. W. Hu.; D. Ol.)

NEWMARKET, a market town 13½ mi. N.E. of Cambridge, England, on the Bury branch of the North-Eastern Railway route. Pop. of urban district (1938) 9,207, and of rural district (1938) 18,820. Area of former, 8.6 sq.mi. For administrative and parliamentary purposes the town and urban district are in West Suffolk, though the rural district is in Cambridgeshire. Newmarket has been celebrated for its horse races from the time of James I, though at that time there was more coursing and hawking. Charles I instituted the first cup race there.

The racecourse, which lies southwest of the town, has a full extent of four miles, but is divided into different lengths to suit various races. It intersects the Devil's ditch or dyke (sometimes also known as St. Edmund's dyke) an earthwork consisting of a ditch and mound about seven and one-half miles long. It starts southeast of the Swaffham-Burwell road, and the ditch has a depth of 15 ft., the slope from the top of the dyke to the bottom of the ditch measures 62 ft., while the over-all breadth of dyke and ditch is 37 yd. It is surmised that it belongs to the Iron Age, and that the builders were the Iceni.

Roman remains have been found in the neighbourhood, and in later times the dyke formed a part of the boundary of East Anglia. (*See* C. Fox, *Archaeology of the Cambridge Region*, 1923.)

NEW MEXICO, popularly known as the "Sunshine state," is located in the southwestern part of the United States. The southern boundary varies from 31° 20′ to 32° N. lat. The eastern boundary is 103° W. from Greenwich; the western, 109° W. It is bounded north by Colorado; east by Oklahoma and Texas; south by Texas and the republic of Mexico; and west by Arizona. It has an extreme length north and south of 400 mi., an extreme width east and west of 358 mi. and a total area of 121,666 sq.mi., of which 155 sq.mi. are water surface.

Physical Features.—The borders of the state are characterized by high plateaus cut by deep canyons, while in the central part faulted mountains surround comparatively level areas filled with alluvial deposits. Between the Rio Grande and the Pecos valley the mountains form a more continuous range than on the west side of the river where the elevated areas form the main continental divide.

The Sangre de Cristo mass is a part of the Colorado mountains which extend into New Mexico slightly east of the north central part of the state and east of the Rio Grande. South of this northern mass two series of ridges extend to the southern boundary: the one near the Rio Grande, called in places from north to south the Sandía, the Manzano, the San Andrés, the Oscura and the Organ mountains; while the eastern group consists of the hills of Pedernal, the White, the Sacramento and the Guadalupe mountains.

On the west side of the Rio Grande the San Juan mountains dominate the country north of the Chama river. A second somewhat smaller mass lies between the Chama and the Jemez river, the Jemez mountains. Across the Puerco the Mount Taylor mountains carry the main divide in a southwestern direction to the Zuñi mountains, which are continued farther south in one of the largest mountain masses of the state, the Mogollons, with the San Mateo and the Magdalena as outlying ridges in the direction of the Rio Grande, and the Black range forming the southeastern part. In the extreme southwestern part of the state the western mountains terminate in several parallel ridges; the Burro, the Pyramid, the Big Hatchet and the Peloncillo mountains. The altitude ranges from 2,876 ft. above sea level to

13,306 ft.

The major divides following the tops of the ranges and high plateaus run generally north and south. Of the most important there may be mentioned the divides between the Pecos and the Canadian valleys; between the Pecos and Tularosa valleys; between the Tularosa and the Rio Grande; and between the Rio Grande and the San Juan, Little Colorado and Gila valleys.

The rivers are the only important bodies of water that make up a part of the physiography of the state. In the northeastern part of the state, in Union county, two of the branches of the Arkansas river have their sources. These are the Cimarron and the North Canadian rivers. A third branch of the Arkansas, the Canadian, flows through Colfax, Mora, San Miguel and Quay counties.

As the Canadian drains the eastern part of the Sangre de Cristo range, so the Pecos river receives the water from the southern part of the range and flows in a southerly direction across the state.

The Rio Grande is the only important river in New Mexico that does not have its source within the state. It enters New Mexico in a deep canyon a short distance to the east of the 106th meridian, and flows south through the centre of the state. On the western side of the continental divide the principal rivers are the San Juan, Little Colorado and Gila, tributaries of the Colorado which flows to the Gulf of California.

The principal characteristics of the soils of New Mexico are: a large amount of mineral matter; a small amount of organic matter; deep soils; and a marked degree of productivity when irrigated.

Climate.—The climate is relatively dry with considerable variation in temperature. The extremes range from 110° F. to −29°. The average winter temperature is about 39° in the south and 29° in the north; for the summer the figures are about 77° and 68°. The average rainfall is 8.57 in. The northwestern quarter of the state has an average rainfall of 7 in. to 20 in. or more, varying with the altitude, and the northeastern quarter experiences 14 in. to 25 in. or more.

The winds blow from the south and west with occasional winter variations to the north and northwest in the northwestern quarter. The average relative daytime humidity varies from 36% to 70% at Roswell, in the southeast, to 41% and 59% at Santa Fe, in north central New Mexico. The skies are generally clear and sunshine is abundant.

Flora and Fauna.—The physiographical conditions of New Mexico determine, in a measure, the distribution of plants and animals. Six life zones are represented in the state, caused by variation in altitude which is a striking characteristic of mountainous areas.

The Lower Sonoran is the zone of mesquite, occupying the valleys of the southern part of the state. For agricultural purposes it is the most important of the zones, because of the long growing period and the high temperatures.

The woody plants of this region include the creosote bush, the Spanish bayonet, the screw bean, the desert willow and valley cottonwood. Cactuses in a variety of species are a part of the flora of this zone.

Among the mammals there are a number of species of rats, mice, squirrels, rabbits, skunks and bats. There are also the jaguar, the New Mexico desert fox, the Mearns coyote, the Mexican badger and the New Mexico weasel. The birds are numerous.

The Upper Sonoran, the largest of the zones, ranks first in economic wealth. It embraces the grazing lands that include about three-fourths of the state, or 92,000 sq.mi. The grasses that give this zone its value are the grama, the galleta, buffalo and porcupine.

Several species of deer, coyotes, antelopes, wolves, prairie dogs and mountain sheep are common to the area.

The Transition zone, covering about 10,000 sq.mi., is the section of the state important for timber. Very little agriculture is carried on, but there is good range for stock. The Merriam elk, Rocky mountain lion, Mexican mountain lion, the mountain bobcat, mountain coyote, Mexican wolf, black bear, grizzly bear, otter and mink are found in this zone.

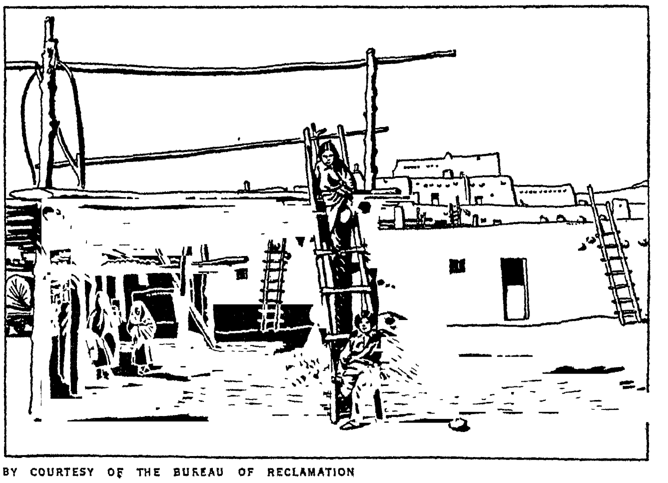
The Canadian zone is about one-fifth the size of the Transition. Its importance lies in the water supply that it stores for the regions of lower altitude. Its lowest parts on the cold slopes are at an altitude of 8,500 ft. The trees found are the Bristol cone pine, the western white pine, Douglas spruce and the balsam.

The Hudsonian is a very narrow zone along the timber line on the upper slopes of the high mountains with an area of 300 sq.mi. The trees and shrubs include the Siberian juniper, Englemann's fir, Parry's fir, several species of currants and sedges. The mammals are few, being mountain sheep, Rocky Mountain woodchuck, the grey and dusky rock cony.

The Arctic-Alpine is the smallest of the life zones represented in New Mexico. The area is above the timber line, at about 12,500 ft. Among the plants are the Colorado poppy, several species of saxifrages, sedges and rushes, the dwarfed closed gentian, alpine larkspur, alpine sagebrush. Few mammals enter the region.

History.—In the period 1525–43 explorations extending from Florida to the California coast paved the way for the later colonization of Florida and New Mexico in the latter part of the 16th century, Texas in the early part of the 18th and California in the latter part of that century. The first of the expeditions was that of Pánfilo de Narvaez. The treasurer of this expedition, Cabeza de Vaca, wandered across the continent to New Spain in the years 1528–36.

The appointment of Antonio de Mendoza as first viceroy of New Spain in 1535 marked the beginning of a period of improved organization in the continental possessions of Spain. Early in 1539 Friar Marcos de Niza was chosen by the viceroy to investigate the land north of Culiacán and inaugurate a new policy in Indian affairs. When Friar Marcos left Culiacán, March 1539, he was accompanied by Estevan, as guide, who was one of the four survivors of the Narvaez expedition. The party reached the vicinity of the Zuñi pueblos, in western New Mexico. In



BY COURTESY OF THE BUREAU OF RECLAMATION

EXTERIOR VIEW OF TAOS, SHOWING ONE OF THE TWO SIX-STORY PUEBLOS AND THE LADDERS BY WHICH IT IS ENTERED

the following year the well-equipped expedition of about 300 soldiers under Francisco Coronado arrived by the same trail. The Zuñi pueblos were conquered and the expedition established winter headquarters near the present town of Bernalillo. The Grand canyon of the Colorado was discovered and other parties explored the Rio Grande valley and the country as far east as the present state of Kansas.

An expedition was organized by the Franciscan friar, Augustín Rodríguez, in the summer of 1581 for the purpose of converting the Indians of the lands to the north of Mexico. A year later Antonio de Espejo led an expedition to rescue the friars of the Rodríguez party, who had remained in New Mexico without protection after the return of their military escort to Mexico. (The name New Mexico seems to have been applied to the pueblos of the Rio Grande valley in the summer of 1582, although the name applied by the members of the Rodríguez expedition, San Felipe, and the name given by Espejo, Nueva

Andalucía, were probably sometimes used.) Near the close of the century a contract was made with Juan de Oñate for the colonization of New Mexico.

The expedition was assembled in the vicinity of Santa Bárbara in Aug. 1597, and after several delays proceeded up the Rio Grande. The first settlement was made at San Juan de los Caballeros in the Chama river valley, July 11, 1598. The construction of the first church in New Mexico was completed and mass was celebrated on Sept. 9, 1598. The present capital of New Mexico, Santa Fe, was founded in 1610.

New Mexico remained a frontier mission field during the 17th century. Twenty friars were serving by 1624; the churches numbered 43; and the number of Christian Indians 34,000. The total Spanish population at the end of the century was only 2,000, which shows that the colony had not become an important source of wealth.

The differences between the Indian culture and the Spanish European manner of life were the principal causes of the revolt of the Pueblos in 1680. The Pueblo Indians were willing to accept the God of the Christians as an additional protecting power, but they could not give up their own beliefs concerning the spirits of the universe without completely destroying their organized tribal life, because every phase of their existence is affected by their conceptions of the relation of the tribe to the world.

The Spanish settlers abandoned their holdings and retreated southward to El Paso. Diego de Vargas effected a reconquest of the province between 1692 and 1696. Albuquerque was founded in 1706 and by 1799 had a population of 4,020. The total population of the province at the close of the 18th century was about 30,000; 20,000 Spanish and 10,000 Indians.

The internal affairs of New Mexico prior to 1821 were not affected to any great degree by the revolutionary developments which took place during this period in Spain and Mexico. New Mexico became a political subdivision of the Mexican republic; granted independence from Spain by the treaty of Córdoba, Aug. 24, 1821.

Trade with the U.S. settlements in the Missouri valley, which had been discouraged during the Spanish regime, was legalized in 1821. An annual caravan set out from Missouri in the spring of the year. The value of the merchandise carried on the outward journey increased from $15,000 in 1822 to $450,000 in 1843. The Santa Fe trade was a success because merchandise could be freighted across the plains to the markets of New Mexico and sold for a lower price than goods could be brought from Vera Cruz by way of Chihuahua.

The republic of Texas claimed the Rio Grande as its western boundary. The prosperous Sante Fe trade, which would be a rich source of taxation, encouraged Texas to assert this claim. An expedition was organized in 1841 which arrived in New Mexico in a disorganized condition and surrendered to Gov. Manuel Armijo at Anton Chico. A second expedition in 1843 also failed.

Upon the outbreak of war with Mexico the army of the west under command of Col. Stephen Watts Kearny, occupied Las Vegas Aug. 15, 1846, and took formal possession of the country. The capital was occupied three days later and a military government was established which ruled the territory for five years. The civil government was retained for two years during which period a rebellion broke out resulting in the assassination of Gov. Charles Bent at Taos, on Jan. 19, 1847. The territory of New Mexico was created by act of congress, Sept. 9, 1850, extending from the 103 meridian of longitude on the east to the territory of California on the west.

The present boundaries were fixed by 1863 with the formation of the territory of Arizona from the western half, and the territory of Colorado from a northern portion two years earlier.

At the outbreak of the Civil War the territory was invaded by a Confederate force, under command of Brig. Gen. H. H. Sibley, which marched up the Rio Grande valley and occupied the capital. The Union army under command of Col. E. R. S. Canby, with reinforcements from Colorado, won the decisive battle of the campaign at Apache canyon, on March 28, 1862. The period following the U.S. occupation was marked by the solution of the nomadic Indian problem and the economic development of the territory. A reservation was established in 1868 for the Navajo Indians in the northwestern part of the territory; the Mescalero Apache were settled in the southern part of the territory in 1873; and the Jicarilla Apache in the northern part in 1880. The legal status of the Pueblo Indian was complicated by the treaty of Guadalupe Hidalgo and later decisions of the U.S. supreme court.

THE STATE ART MUSEUM AT SANTA FE

The building of railways into the west, the increasing population, and the quieting of the Indians resulted in a great increase in cattle and sheep. The overflowing cattle herds of Texas were used to stock the ranges in New Mexico and the States to the north. The Goodnight-Chisom trail up the Pecos valley was followed by the overland drives to the ranges in Colorado and Wyoming; and to the railway shipping points in Kansas. Conflicts occurred between the cattle and sheep raisers over water and the use of the open range. The most bitter of these was the Lincoln county war which started in 1877 and lasted about three years.

The Atchison, Topeka and Santa Fe railway was extended to Albuquerque in 1880. A year later connection was made with the Southern Pacific railway at Deming, which placed the territory on a transcontinental line.

With the advent of the railways mining and irrigation developed; the population increased and a public-school system was established in 1891.

The Spanish and Mexican land grants in New Mexico have constituted one of the most difficult land problems in the history of the state. The treaty of Guadalupe Hidalgo confirmed the grants but lack of accurate documents made difficult the settlement of conflicting claims.

Constant efforts were made to secure statehood. The Enabling act was passed by congress on June 20, 1910, a constitution was drafted and approved, and on Jan. 6, 1912, the state was formally admitted to the union. In politics during the first half of the 20th century New Mexico voted Democratic except in 1918, 1920, 1926 and 1928.

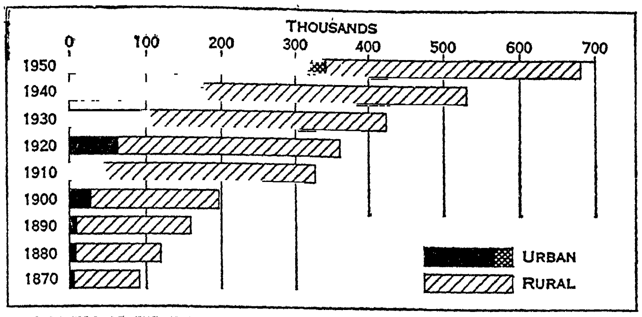
Population.—The population of New Mexico in 1850 was 61,547; in 1880 it was 119,565; in 1910, 327,301; in 1940, 531,818; and in 1950, 681,187. This last figure represented an increase of 28.1% over the population in 1940. The population per square mile in 1950 was 5.6, as compared with 4.4 in 1940, and with 50.7 for the U.S. in 1950.

Of the 1950 population, 314,636, or 46.2%, lived in incorporated places of 2,500 or more, as compared with 33.2% in 1940, when these places constituted the urban area. The entire urban population, under a new definition set up for 1950, which included also five unincorporated places of 2,500 or more, amounted to 341,889, or 50.2% of the state total.

The number of households in 1950 was 177,128, as compared with 129,475 in 1940.

The average population per household had declined from 4.1 in 1940 to 3.8 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 90.0% native white; 2.5% foreign-born



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEW MEXICO: 1870 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

white; and 7.5% nonwhite, mainly Indians. There were 104.2 males per 100 females in the total population, and 103.6 in the native white population alone.

Four and nine-tenths per cent of the population was 65 years old or over, and 50.4% of the population 14 years old and over was in the labour force.

Of the total number of employed males, 22.8% was engaged in agriculture, 6.5% in mining, 14.4% in construction, 6.6% in manufacturing, 7.2% in transportation and 16.4% in wholesale and retail trade.

*Final figures for 1950 based on new definition. *See* comment in text.

Government.—With slight amendments the constitution adopted in 1911 remains the basis of the state government. Amendments may be proposed by a majority of the members in each house and must then be voted upon by the people at the next general election or a special election called not less than six months after adjournment of the legislature.

The state legislature is composed of a senate and house of representatives having 31 (beginning in 1953) and 55 members respectively. Regular sessions are held in odd-numbered years, beginning the second Tuesday in January. Representatives are elected for two years and senators for four. Special sessions can be called by the governor, and must be called by him on request of three-fifths of the legislators. The governor possesses the veto power which can be overridden by a two-thirds vote of the legislative members present and voting in each house. The people have the right of referendum.

A direct primary system was established in 1938. In 1949 it was changed to a preprimary nominating convention. The state has two representatives and two senators in the national congress.

The constitution provides for 11 elective administrative officers, namely, governor, lieutenant governor, secretary of state, auditor, treasurer, attorney general, commissioner of public lands, superintendent of public instruction and three corporation commissioners, all serving two years. They may succeed themselves for one term but are not afterward eligible for re-election until a two-year period has elapsed, except the lieutenant governor who may succeed himself indefinitely.

State boards and commissions numbered about 80 in 1950. Newer bodies included a board of examiners in the basic sciences for the healing arts, a fair employment practices commission, a commission on alcoholism, an economic development commission, a five-member state highway commission with overlapping six-year terms, and five-member bipartisan boards of regents with six-year overlapping terms for educational institutions.

There are five supreme court justices elected one at a time for terms of eight years each. Nine district courts (but 12 judges) hold two regular sessions each year at the county seat. The district judge is elected for six years. There are probate and juvenile courts in each county and justices of the peace in each precinct.

Finance.—The cost of state government nearly trebled in terms of dollars during the decade 1938 to 1948, increasing from $22,300,354 to $61,220,990. The assessed value of property subject to taxation increased during the decade from $312,442,485 to $482,441,779.

The adoption of a constitutional amendment limiting property taxation to 20 mills made necessary a sales tax in 1935, a severance tax in 1937, a compensating tax in 1939 and a tobacco tax in 1943.

In 1948 the gross state debt was $22,704,896, chiefly highway debentures. Because of that fact, the gasoline tax was raised from five cents to seven cents per gallon, with the increase earmarked for retirement of the highway indebtedness. The total of all receipts was $64,537,264, including $8,892,788 from the five-cent gasoline tax; $13,433,200 from the 2% sales tax; and $8,321,960 from oil and gas rentals and royalties.

There were 48 banks with total deposits of $275,578,000.

Education.—Previous to 1891 when the general public-school system of New Mexico was established, education was carried on mainly by private and religious agencies which established mission schools and academies. Progress in the public-school system was slow from 1891 until 1911 when statehood was granted, but was rapid thereafter, as is shown by the increase in expenditures for public schools.

The governing authority of the public-school system is the state board of education consisting of the governor, the superintendent of public instruction, who is elected for two years, and five members, who are appointed by the governor. During the period 1937–38 to 1947–48, enrolment increased from 129,877 to 136,097 in the public schools; expenditures from $9,001,045 to $22,940,958; and property valuation from $15,635,022 to $38,696,093. There were, in 1947–48, 868 schools, a marked decline for the decade; 982 buses transported about 33,000 students daily at a cost of $1,715,769. Teachers must have ordinarily a minimum of one year of college work; their average annual salary in 1950 was $2,287 in the rural schools and $2,854 in the city. Free basic elementary textbooks are supplied. A broad curriculum is provided; in the elementary schools it includes safety instruction and special attention for handicapped children. Summer workshop training for teachers was introduced in higher institutions. In addition to the public schools, there were 57 private and parochial schools in 1950 employing about 375 teachers for instructing approximately 13,500 pupils. The state maintains a contributory teacher retirement plan.

The University of New Mexico, in Albuquerque, is organized with a graduate school and eight colleges: arts and sciences, engineering, education, fine arts, pharmacy, business administration, law and general. It had a faculty of about 300 and an enrolment of about 4,800 annually at mid-century. Work is offered in summer session, field session, extension division, naval reserve officers' and air force reserve officers' training corps. The Ph.D. degree is granted in certain departments.

The New Mexico College of Agriculture and Mechanic Arts, near Las Cruces, offers work in schools of arts and sciences, engineering and agriculture. The latter includes the extension service, experiment station, regulatory services and instructional services. It is a land-grant college staffed with a faculty of about 150 and a student enrolment of about 1,700 at mid-century. The M.A. degree is granted.

The New Mexico School of Mines, in Socorro, includes the college division, bureau of mines and mineral resources and the research and development division. At mid-century it had a faculty of about 45, and the student enrolment was limited to about 300. The bachelor and a professional degree are granted.

New Mexico Highlands university (formerly New Mexico Normal university), Las Vegas, had a faculty of about 70, and an additional group of instructors in technical trades. The M.A.

degree is granted and extension work is offered. The university operates on the quarter system.

Eastern New Mexico university (formerly Eastern New Mexico college), Portales, had a faculty of about 60 in 1950. It is organized into schools of liberal arts and sciences, business and economics, music, teacher education and vocations. The B.A. degree is granted.

New Mexico Western college (formerly New Mexico State Teachers college), Silver City, offers work in liberal arts, teacher training and vocational training. It had a faculty of about 60 in 1950. The M.A. degree is granted.

The New Mexico Military institute, Roswell, is supported in part by state funds. High school and senior college work is offered.

A school for the blind is maintained in Alamogordo and a school for the deaf in Santa Fe.

Charities and Corrections.—The state supports a penitentiary, established at Santa Fe in 1884, and a prison farm of 2,000 ac. acquired in 1939 for outdoor rehabilitation; a hospital for the insane at Las Vegas, established in 1889; a miners' hospital at Raton, 1903; an industrial school for boys, originally established at El Rito in 1903 and moved to Springer in 1909; a girls' welfare home, Albuquerque, 1919; a school for mental defectives, Los Lunas, 1925; and the Carrie Tingley Crippled Children's hospital, Hot Springs, 1937.

Agriculture and Livestock.—The area east of the Rio Grande valley contains about four-fifths of the cropland harvested in the state. The valley and region to the west has an acreage of about 330,000, principally in the middle Rio Grande valley and Catron county northward.

In Curry, Roosevelt, Quay, Harding, Union and Colfax counties an average rainfall of approximately 14.3 in. permits considerable dry farming, while over the rest of the state crops are dependent almost entirely upon irrigation and confined to those river valleys where it is practicable: the Rio Grande, Pecos, San Juan, Gila, Canadian and their tributaries.

The estimated value of the major crops of New Mexico in 1949 was $90,051,000; the total cropland, including minor crops, was 1,830,000 ac. For the period 1938–47 the average acreage for leading crops was: grain sorghums, 190,000; winter wheat, 305,000; corn (maize), 177,000; dry beans, 196,000; cotton, 115,000; all hay, 217,000. The average annual production: grain sorghums, 2,663,000 bu. or 12.5 bu. per acre; winter wheat, 3,580,000 and 11.4; corn, 2,474,000 and 14.0; dry beans, 642,000 bags and 308 lb. per acre; cotton, 119,000 bales, 497 lb. per acre; all hay, 453,000 tons, 2.09 per acre.

The leading cash crop, cotton, was valued in 1948 at $38,249,000 in lint and $6,650,000 in cottonseed. For the same year all hay was valued at $14,022,000; dry beans, $2,938,000; grain sorghums, $4,486,000; corn, $3,024,000; and winter wheat, $6,397,000. Minor crops were: potatoes, $446,000; oats, $718,000; and barley, $703,000. Apples to the amount of 750,000 bu. were raised; peaches, 74,000 bu.; and 9,180,000 lb. of peanuts.

The chief farm animals in New Mexico are horses, mules, cattle, sheep and hogs. Their average annual value for the years 1939–48 was $94,720,000 and in 1949, $180,384,000. The number of horses and mules declined steadily during the period; they averaged respectively 114,000 and 9,000 head, but in 1949 numbered only 84,000 and 6,000. The average number of cattle for the period was 1,275,000, at an average value of $56.30 per head; in 1949 the number was 1,178,000 worth $149,606,000. Sheep averaged 1,888,000 at $8.40 per head; in 1949 1,393,000 were worth $23,820,000. Hogs averaged 103,000 at $17.30, but were estimated at 66,000 in 1949, worth $1,907,000.

The total estimated cash crop value for 1949 was $90,051,000; for livestock the total was $180,384,000.

Mining.—The high point in gold production was reached in 1915 with 70,681 oz. It dropped during World War I, reached a high point again in 1938, then declined to 3,249 oz. in 1949 worth $113,715. Silver reached a high point of 2,005,531 oz. in 1915 and 1,400,876 oz. in 1939, then declined to 380,855 in 1949 with a value of $344,693.

Copper has been a leading mineral; 160,200,000 lb. were produced in 1942, declining to 110,776,000 lb. in 1949, valued at $21,822,872. Lead ranged above an annual production of 20,000,000 lb. during the depression years 1929–33, then declined to 9,304,000 lb. in 1949, worth $1,470,032. Zinc reached a production of 119,048,000 lb. in 1943, then declined to 58,692,000 lb. in 1949, valued at $7,277,808.

Coal production slowly declined from 3,709,000 tons in 1913 to 980,000 tons in 1949 valued at $4,998,000. Newer sources of mineral wealth are petroleum, potash and natural gas. Petroleum production increased from 38,854,000 bbl. in 1937 to 47,932,000 bbl. in 1949. Potash was valued at $7,026,609 in 1941 and $33,529,132 in 1949. The estimated value of gas was $985,000 in 1940 and $5,365,000 in 1949.

Manufactures.—Without taking into account changes in classification of manufactures by the bureau of the census, and fluctuations during depression and recovery, manufacturing increased slowly in the first half of the 20th century. In 1899, 174 establishments employed 2,578 persons, paid them $1,290,000 and added $2,062,000 to value by manufacture. Comparable figures for 1947 were: 432; 7,590; $18,222,000; and $55,486,000. The great increase occurred after the census of 1939; for instance, value added by manufacture was only $8,640,000 in the latter year.

The chief industries in 1947 were food and kindred products; 144 establishments added $7,898,000 in value by manufacture. Lumber and products (except furniture) were 92 and $8,250,000. Printing and publishing industries; 78 and $3,729,000. Chemicals and allied products; 10 and $13,738.

Transportation.—Six railroads operate in New Mexico; the most important is the Atchison, Topeka and Santa Fe. Commercial air transportation is provided by one transcontinental and three regional lines (Albuquerque is the junction airport). Improved surface highways increased from about 2,100 mi. in 1929 to 9,154 mi. in 1948. A motorized state police was established in 1933 and a state driver's licence has been required since 1937. The ports of entry, established to collect the commercial mileage tax instituted in 1933, were placed under the state police and called registration stations.

NEW MILFORD, an incorporated city of Bergen county in northeastern New Jersey, U.S.A. It is about 13 mi. N.E. of Paterson and about 10 mi. W. of the Hudson river. The altitude is 15 ft.

New Milford is on state highway 200 and is served by the New Jersey and New York railroad which is part of the Erie system. The population was 3,215 in 1940 and 6,018 by the federal census of 1950.

The city is governed by a mayor and a city council; the mayor

is elected directly by the people for a two-year term, the six city councilmen for three-year overlapping terms. There is a sewage treatment plant which is municipally owned and operated. New Milford is served by the Dennis Memorial library. Close by the city is the Oradell reservoir.

NEWNAN, a city of western Georgia, U.S., the county seat of Coweta county; on federal highway 29, 40 mi. S.W. of Atlanta. It is served by the Atlanta and West Point and the Central of Georgia railways.

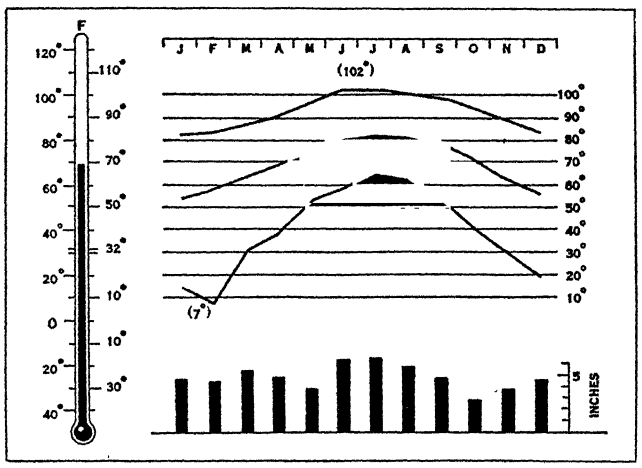
The population was 8,190 in 1950 and was 7,182 in 1940. It is a shipping point for agricultural products.

NEW ORLEANS, a city of Louisiana, U.S., situated on the east bank of the Mississippi river about 107 mi. from its mouth. It was originally on a bend in the river and from that fact its popular name, "Crescent City," was derived.

Physical Features.—The soil is an alluvial deposit from the river and, therefore, has its greatest elevation at the river bank, where the ground behind the levees is from 10 to 15 ft. above the mean level of the Gulf of Mexico; but the lower parts of the city are below gulf level. Built on the narrow ridge of land at the river bank, the growing city first expanded along the river front and later, the cypress swamps between the river and Lake Pontchartrain having been cleared and drained, covered a distance of from 4.5 to 7.3 mi.

The river approaches New Orleans flowing eastward, turns rather abruptly to the south at the upper municipal limits, then eastward as it passes the modern city, and finally northward in one of the sharpest bends to be found in the lower river, near the site of the original city or *vieux carré.*

The difficulties involved in building a city on such a site as that of New Orleans were great. Drainage, sanitation and a satisfactory water supply were realized nearly two centuries after the establishment of the first settlement, and in the interim yellow fever



WEATHER GRAPH OF NEW ORLEANS. THE THERMOMETER INDICATES THE NORMAL ANNUAL MEAN TEMPERATURE. THE MIDDLE CURVE SHOWS THE NORMAL MONTHLY MEAN TEMPERATURE; THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED IN EACH MONTH. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

and cholera took frightful tolls. Modern engineering and sanitation finally triumphed, and modern New Orleans became one of the healthiest cities of the world.

The boundaries of the parish of Orleans and the city of New Orleans are the same, with a land area of 199.4 sq.mi. The boundary line is very irregular, but may be given approximately as Lake Pontchartrain on the north, the Rigolets and Lake Borgne on the east, the parish of St. Bernard and the Mississippi river on the south and Jefferson parish on the west.

The city gradually expanded by spreading along the higher lands near the river bank.

New Orleans is noted for its mild and balmy winters; the summers are uniformly warm but extreme heat is unknown, and the highest temperature recorded by the weather bureau is 102° F., while a temperature of 100° F. is seldom reached, because of the cool breezes from the Gulf of Mexico. Mean temperatures are:

January	54.5°	July	82.4°
February	57.2	August	82.3
March	63.0	September	79.4
April	68.9	October	70.4
May	75.2	November	61.9
June	80.9	December	55.7
Yearly average			69.3

The rainfall averages 56.77 in., well distributed through the year.

Population.—The population of New Orleans was 567,257 in 1950, 494,537 in 1940, 458,762 in 1930, and 387,219 in 1920. The increase in the decade 1940–50 was 14.7%; 1930–40, 7.3%; 1920–30, 18.5%. Every country in Europe is represented in the inhabitants. The Italians are the most numerous; other nationalities of great numerical strength are Irish, Germans, English and French. The French, because of the creole element, feel perfectly at home, speaking their own language, and living among sympathetic surroundings. The creoles are the descendants of the French and Spanish settlers of Louisiana. When the city passed under the U.S. flag the Americans built up a quarter for themselves, upstream from the *vieux carré,* the upper boundary of which was Canal street.

The line is not as strictly drawn now as in earlier years, as many creoles have settled in the newer portions of the city and some Americans have moved to the French quarter. This change was more pronounced in the third decade of the 20th century during which time a lively interest in the old quarter developed into a movement to preserve those buildings and other historical sites of the city.

Water Supply, Drainage and Sewerage.—The entire city, except for its levees, is below the river high-water mark while a large portion of it is below that of Lake Pontchartrain. Combined with these difficulties New Orleans has heavy rainfall; occasionally more than 3 in. in 1 hr., 7 in. in 5 hr. and 9 in. in 12 hr., having been experienced. As a result of the occasional excessive rainfalls, it has been necessary to provide large canal systems to convey the water to and from the pumping plants, and eight pumping stations for the removal of storm water have been built. The average annual rainfall is more than 56 in.; the topography is such that the runoff must be removed by pumping. The capacity of the drainage pumps is 27,000 cu.ft. per second; this is sufficient to remove the water from a lake 10 sq.mi. in area and 8.6 ft. deep in 24 hr.

Some drainage water is pumped more than once; altogether this is the greatest aggregation of drainage pumps to be found anywhere in the world.

The sewage of the city is collected separately from the drainage and is finally discharged into the Mississippi, where the dilution is so great that it is not noticeable farther downstream. Like the drainage, the sewage has to be pumped, much of it through two or more lifts, and this is accomplished by electric pumping stations operating automatically.

In the early days of the colony the turbid water from the Mississippi was carried from the river and settled in large earthen jars. Wells were used to supply water for household purposes but not for human consumption. In 1810, a first attempt was made to established waterworks. In 1833 the Commercial bank was organized for the purpose of establishing waterworks in New Orleans and iron pipes replaced the early wooden ones. In 1869 the city bought the system from the company, issuing bonds for that purpose; but lack of funds and bad management obliged the city in 1877 to give a monopoly to the New Orleans Water-Works company. The river water was too muddy to be useful for most purposes and cisterns were preferred, although a time of drought often caused scant supply.

To solve the problems involved and to study the methods of treatment for purification of the river water, an experimental plant was established in 1900, and a process adopted for softening by the use of lime and small amounts of sulphate of iron, producing a coagulation whereby the fine clay particles are brought together into large masses that will settle out in a few hours, or which are large enough to be completely removed by the filters. By this

process, first put into operation in 1909, New Orleans has had continuously an abundant supply of clear, pure water of the highest quality.

Later additions to the water purification plant increased its capacity to a normal production of 112,000,000 gal. per day and to a maximum of 160,000,000 gal. if necessary.

Streets, Bridges and Parks.—The streets of the *vieux carré* or old French city are narrow, but in the newer portions there are many wide avenues and boulevards, some of which were originally canals. Some of the avenues, such as St. Charles, Esplanade, Claiborne and others, were originally laid out with sufficient width for a street on each side, accommodating traffic in both directions and with a "neutral ground" between, which has been used for street car tracks and planted with trees.

New Orleans is situated on the Old Spanish trail which extends from San Diego, Calif., to St. Augustine, Fla. It is at the southern end of the Jefferson highway which runs to Winnipeg, and the Colonial highway which leads to New York. The Jackson and Mississippi Valley highways lead to points in the middle west and the Mississippi valley.

Early in the year 1928 the New Orleans-Pontchartrain bridge was opened to traffic. This concrete structure, nearly 25,000 ft. in length, was built by a private corporation at a cost of $5,500,000.

A more direct line to the Gulf coast was created shortly after by building bridges across Chef Menteur and the Rigolets by the Louisiana Highway commission.

New Orleans is well supplied with parks. Audubon park, with 234 ac., is situated in the upper portion of the city and contains a statue of Audubon. The original area of City park was about 1,400 ac., later developed and beautified further. The area was added to by hydraulic dredging on the lake shore front between West End and beyond Bayou St. John on the east. A large municipal yacht harbour was constructed at West End. Many miles of boulevards and driveways, with parks and bathing beaches, were also developed as residential areas. Most of the military installations constructed in this area during World War II were later disbanded, only a naval air base and Camp Leroy Johnson remaining. The old New Orleans airport on the lake was replaced in 1946 as the municipal terminal by the Moisant International, located 10 mi. W. of the city and covering 1,360 ac. It was served in 1950 by eight lines: Capital, Chicago & Southern, Eastern, National, Delta, Mid-Continent, Pan American and Taca.

Gas and Electricity.—Electric cars were first used in New Orleans in 1893. At that time there were several independent competing lines which were later consolidated into a modern, efficient system. In the 1940s these were replaced in part by buses. The New Orleans public service supplies electricity and natural gas for power, lighting and domestic use.

Port.—New Orleans is one of the largest North American ports, accommodating more than 80 steamship lines. Roughly 3,000 vessels enter the port annually. Foreign trade alone in 1949 amounted to 7,005,800 tons, with a value of $1,226,000,000, making it the second port in the nation. Water-borne commerce for the same year totalled 29,889,400 short tons. The limits of the port include a frontage of 41 mi. on both sides of the Mississippi and 11 mi. on the Industrial canal, which extends 5 mi. from the river to Lake Pontchartrain; 11 mi. of publicly owned wharves, steel sheds, cotton warehouses, grain elevators and other facilities are maintained. Located in the city is the nation's second foreign trade zone, and the construction of a shorter tidewater ship canal to the Gulf was approved by the U.S. engineers.

Transportation.—All railroad lines entering New Orleans terminate there: the Gulf Coast Line; Gulf, Mobile and Ohio; Illinois Central; Louisiana and Arkansas-Kansas City Southern; Louisville and Nashville; Missouri Pacific; Southern; Southern Pacific; Texas Pacific; and two short local lines to the delta below the city. Construction began in 1950 on a central union station and a complete rerouting of tracks.

The Federal Barge line supplies freight service to points on the Mississippi and Warrior rivers.

Commerce and Industry.—In 1948 there were 724 businesses producing products with a value added by manufacture of $222,995,000. Bank debits in 1949 were $8,345,725,000; in the same year property valuation was $619,249,761.

Education.—The New Orleans public-school system in 1949–50 consisted of 173 schools with a total attendance of 69,241. Of these 61 were kindergarten, 84 elementary, 13 high schools, 12 evening and 3 trade. Included were 54 separate schools for Negroes, with an attendance of 31,684. In addition there were 122 nonpublic schools, both private and parochial (mostly Catholic), 83 at the elementary level and 28 at the high school, with a total attendance of 38,364. The school population of the city below the college level, therefore, was divided into three roughly equal groups: white public schools, Negro public and nonpublic. There were 28 nonpublic high schools in contrast to 13 public. More than 5,000 students attended night school, slightly more than half of whom were Negroes.

Both the Catholic Church and the Lutherans operated their own systems. Uniform textbooks purchased by the state department of education were supplied to all nonpublic schools, and their classes were conducted under a curriculum approved by the department. Largest of the strictly private schools was Newman, founded in 1903, which is coeducational. The Delgado Trades school, opened in 1921, was the first of its type. The public school budget for 1949–50 was $10,200,000.

Tulane University.—The history of Tulane university dates back to the foundation of the medical college in 1834. It was chartered in 1835 and in the following year issued the first degree in medicine conferred in the southwest. The constitution of 1845 provided for the establishment of a university in New Orleans, embracing the medical college to which law and academic departments were to be added.

In 1882 Paul Tulane, for many years a merchant in New Orleans, gave liberally for the higher education of "the white young persons in the city of New Orleans." His entire donations reached the sum of $1,050,000. He died at Princeton, N.J., in 1887. In 1884 the board of administrators of the Tulane educational fund received from the legislature complete and perpetual control of the University of Louisiana. This act was ratified in 1888 and again in the constitutions of 1898, 1913 and 1921.

H. Sophie Newcomb Memorial college is the women's department of Tulane university. Tulane university had a total enrolment of 7,698 in all departments during the 1949–50 session, exclusive of the summer school, which numbered 1,902 more. Its endowment in June 1950 was $14,272,547.

Loyola University.—In 1904, the Jesuit fathers opened a school opposite Audubon park. A collegiate course was added and in 1912 the legislature granted them power to confer "degrees in arts and sciences and all the learned professions, such as are granted by other universities in the United States."

Monuments, Public Institutions and Customs.—The Delgado Art museum in City park was established by a gift from Isaac M. Delgado in 1911. There is a nucleus of an art collection containing many works of great merit. The annual exhibition of the Art association is an important event. The Cabildo houses an important historical museum containing much of interest and value pertaining to the history of Louisiana and New Orleans. The Presbytery, facing Jackson square on the side of the Cathedral of St. Louis, contains a valuable museum of natural history, principally relating to Louisiana. The Confederate Memorial hall contains relics of the Civil War. It is located on Camp street. The Tulane university museum occupies the entire third floor of Gibson hall; it contains petrological, palaeontological, zoological and anthropological sections. New Orleans has become one of the cultural centres of the United States and the mecca for writers, painters, sculptors and artists in all fields. Several galleries exhibiting contemporary art are to be found in the *vieux carré*. A civic symphony has been established and the Philharmonic society brings the great contemporary musicians and concerts to the city. The Metropolitan Opera comes annually, thus reviving interest in French opera which was originally heard in New Orleans long before it was heard in New York. The Middle American research institute, created in 1924 as a department of Tulane university, has a museum and library,

VIEWS OF THE NEW AND OLD CITY OF NEW ORLEANS

1. Air view of New Orleans, showing at the left Canal street, the centre of the retail business district, and the skyscrapers of the modern city. In the distance is the Mississippi river
2. Historic Jackson Square, formerly the Place d'Armes, in the old French Quarter. On the left side of the St. Louis Cathedral, built in 1794, is the Spanish Cabildo, now part of the Louisiana State Museum, and on the right is the Presbytere, construction on which was started in 1794. On adjoining sides of this Square are the so-called Pontalba apartments built by the Baroness de Pontalba in 1849

field work and publications as its primary activities. The library of 40,000 items and the museum contain manuscripts, documents and other material relating to Mexico and Central America from expeditions and purchases which are being constantly increased. The institute has a permanent endowment of $300,000. The New Orleans spring fiesta was organized in 1937 and has created tourist interest in art, architecture, gardens and local traditions. New Orleans has been enriched by the liberal planting of azaleas and camellias, resulting in increased interest in gardening and landscaping.

New Orleans has a number of excellent hospitals: the Baptist; Charity; City (for mental diseases); Eye, Ear, Nose and Throat; Hôtel Dieu; Soniat Memorial-Mercy hospital; the Flint-Goodrich hospital of Dillard university for Negroes; Ochsner foundation; Sara-Mayo; Metarie; and the U.S. marine and U.S. veterans' hospitals, Illinois Central hospital and the Touro infirmary.

In 1950 construction began on a new $14,000,000 veterans' hospital.

More than 50 newspapers and periodicals are published in New Orleans, including two morning and two afternoon papers. The *New Orleans Picayune* was founded in 1837, the *Daily Times* in 1863, the *Daily Democrat* in 1875. The two latter formed the *Times-Democrat* in 1881 and this and the *Picayune* became the *Times-Picayune* in 1914. The *Daily Item* began publication in 1877, later becoming the *New Orleans Item* and in 1924 publishing the *Morning-Tribune* and the *Sunday Item-Tribune*, suspended in 1941 but resumed later. The *Daily States*, started in 1880, was purchased by the Times-Picayune Publishing company in 1933 as an afternoon and combined Sunday publication.

There are some 300 churches in New Orleans, representing different denominations. Roman Catholic churches are the most numerous.

The French opera house, designed by Gallier, was erected in 1859 at the corner of Bourbon and Toulouse streets. It was a distinctive and widely known centre of artistic and social life in New Orleans for many years. The Mardi Gras balls were held there until the building was destroyed by fire in 1919.

The carnival season extends from Twelfth Night to Lent, and its climax is reached in the festivities of Mardi Gras, the eve of Ash Wednesday. The ancient custom of celebrating the carnival was brought to New Orleans by the Latin peoples, and especially by the young creoles who studied in Paris and returned to live in New Orleans. Beginning with Twelfth Night there is a series of brilliant balls, and during the last week the balls of Momus, Proteus and Comus, preceded by gorgeous pageants, bring the season of mirth to a conclusion. On Mardi Gras, Rex parades the streets and at night the final parade is that of Comus.

Among writers and historians of note associated closely with New Orleans should be mentioned: John James Audubon, C. E. A. Gayarré, Alcée Fortier, Grace King, Mary Ashley Townsend, Lafcadio Hearn, George W. Cable, Mollie Moore Davis, Lyle Saxon and Harnett Kane.

Government.—The city government was at first carried out by a mayor and administrators, seven in number. Finally, in 1912, by act of the legislature, the commission form of government was adopted; the mayor became commissioner of public affairs. Four other commissioners had charge of public finances, public safety, public utilities and public property. In 1950, upon the re-election of Mayor deLesseps Morrison, a hostile legislature restored a semialdermanic system, increasing the number of commissioners to seven, each elected by a separate municipal district.

History.—The city of La Nouvelle Orléans was founded by a French governor of Louisiana, Jean Baptiste Le Moyne, Sieur de Bienville, and was named in honour of the regent, the duc d'Orléans. The island of Orleans was chosen for the site, on an elevation along the east bank of the river and about 107 mi. from its mouth, between the head of Bayou St. John and the river. Among the advantages of this site were the higher land, accessibility by two main waterways (the Mississippi and the lakes), and by Bayou St. John for the small craft of that day. On the other side of the river it was not far to Bayou Barataria, which later was destined to become the rendezvous of the famous pirates, Jean and Pierre Lafitte, and which offered access to the gulf without stemming the current of the Mississippi.

There is some doubt as to the exact date of the founding of New Orleans, but it is generally given as 1718. It was then proposed that John Law's famous company, which had obtained charter for the territory from France, should move its headquarters from the barren coast country to the new site. New Orleans thus became the capital of the Colony in 1722. At this time the city had but 100 houses and 500 inhabitants. It was laid out in approximately a parallelogram, 4,000 ft. long on the river by 1,800 ft. in depth, divided into regular squares 300 ft. on each side. In 1724 the streets were named. The houses were rude cabins of split cypress boards, roofed with cypress bark. They were separated from one another by willow copses and weed-grown ponds swarming with reptiles. Two squares on the river front near the centre of the city were set apart for military and ecclesiastical uses. The front was the Place d'Armes, now Jackson square; the rear one was early occupied by a church. In 1726 a monastery was erected to the east of the church for the Capuchin monks, who had arrived two years earlier. A company of Ursuline nuns came to New Orleans in 1727. At the same time the Jesuits arrived and received a large tract of land from Bienville, the French governor. This tract, bounded by what is now Common, Tchoupitoulas, Annunciation and Terpsichore streets, was later added to by donation and purchase and extended to Felicity street. Here the Jesuits cultivated myrtle, the wax of which was then a staple article of commerce; the orange, the fig, indigo and probably sugar-cane. These became staple crops. The Order was suppressed for political reasons in 1763 and its great plantation confiscated by the king of Spain.

Many storms and disasters occurred during the early years of the city. In 1719 the river rose to a great height and the site was completely inundated to a depth of a few inches. In 1722 a hurricane destroyed 30 houses and damaged crops. German colonists who had settled on the banks of the Arkansas managed to reach New Orleans and there prayed Bienville to send them back to their homes. He persuaded them to establish themselves along the river above the city, and thus was formed the nucleus of the German settlement, which to this day is called the German coast.

There were few women of good character in the Colony in the early days; and many of the better class of settlers, missing their home life, desired to return to France. It thus became imperative that if the settlement was to survive, the men must have good wives to make homes for them. When Bienville left the Colony in 1724, he promised to send a load of good women as soon as possible. In 1727 the "Casket Girls" (*Filles à la cassette*) arrived and were placed under the care of the Ursuline nuns whose convent had been established in the same year. They were first domiciled in Bienville's former home, but in 1730 their own house on Chartres and Ursuline streets was completed. This is one of the oldest buildings in the United States west of the Alleghenies.

In 1763 the Treaty of Paris was concluded between France and England. By this treaty England gained all the territory east of the Mississippi except the Isle of Orleans. On Nov. 3, 1762, Louis XV. had, by the secret treaty of St. Ildefonso, given the Isle of Orleans and all of Louisiana west of the Mississippi to his cousin, Charles III. of Spain. It was not until Oct. 1764 that the French king notified governor Abbadie of the transfer of the Colony, nearly two years previously, to Spain, and ordered him to surrender Louisiana to accredited Spanish commissioners when they should present themselves. There was sorrow and dismay when these tidings were received. In 1783, the Treaty of Paris confirmed Spain in possession of this territory and granted free and open navigation of the Mississippi river to the subjects of Great Britain and the United States. In 1788, and again in 1794, fires destroyed large portions of the city. By the first, 19 squares were devastated, and 856 houses were burned. The second fire destroyed 212 houses and caused a loss estimated at $2,600,000. Rebuilding with brick instead of wood, resulted in a more permanent city.

During this period the Spanish Governor, Almonaster y

Rojas, was the greatest benefactor of New Orleans; he gave freely of his private fortune for many purposes. He rented in perpetuity the squares flanking the Place d'Armes and erected a row of brick buildings to be used as shops and retail stores. These were replaced in 1845 by the Pontalba buildings, which bear the name of their builder, Baroness Pontalba, a daughter of the governor. He rebuilt the Charity hospital, which had been destroyed by a hurricane, and a chapel for the Ursuline nuns. Through his generosity the cathedral was completed in 1794; it was constructed of bricks and had much the same appearance as to-day except in details of the belfry and towers. A town-hall, or hall of the Cabildo, presented to the city in 1795, was used as a meeting place of the Spanish Cabildo. It was here that the formal transfer of Louisiana from France to the United States took place.

Before the cultivation of sugar-cane the staple crop of Louisiana had been indigo; but it did not prove successful. In 1794 Etienne de Boré succeeded in making granulated sugar. His plantation is now within the city limits. By the Treaty of Madrid, signed in Oct. 1795, Spain and the United States agreed that New Orleans should be open to the Americans as a port of deposit for three years; the produce was to be free of duty but a reasonable price for storage was to be paid. The commerce of New Orleans increased greatly, the levee was the scene of noisy, bustling business.

The purchase of Louisiana by the United States in 1803 had a further beneficial effect on trade. The first half of that year showed an increase of 37% in tonnage over that of 1802; exports exceeded $2,000,000 and imports $2,500,000. The flat-boat trade with the upper valley also increased enormously. Above the *vieux carré* commercial houses were erected and this newer portion of the city gradually became a business centre. Above the Terre Commune, Common street, was Madame Gravier's plantation, a part of the former Jesuit grant. Many of the street names are reminders of the first owners or of the first use of the locality. Gravier street bears the name of its original owner; Poydras that of a philanthropist; Magazine was so named because of the great tobacco warehouses on Magazine and Common, and Camp street because of a slave camp between Poydras and Girod. An aristocratic suburb was along the Bayou St. John road. Below the old city the Marigny plantation was settled by the French.

In 1805, New Orleans was incorporated as a city and the people exercised their right of suffrage for the first time in electing aldermen. Between 1803 and 1810 the population more than doubled with the arrival of many whites, mulattoes and slaves from Cuba, Santo Domingo and other islands of the West Indies. The creoles of those islands had much in common with the creoles of Louisiana—many were of French ancestry, they had the same religion, language and political ideas, and had met with the same political misfortunes. The creoles were numerically so strong that they dominated the city.

On Jan. 10, 1812, the "New Orleans," a steam propelled vessel built by Nicholas Roosevelt, arrived on her maiden trip from Pittsburgh.

The War of 1812 found New Orleans without adequate defences; Wilkinson was ordered to occupy that part of Florida west of the Perdido river; the Creek Indians massacred 350 whites at Ft. Mimms, Miss.; drunken Choctaws roamed the streets of New Orleans; Barataria bay was held by the Lafittes and their band of piratical smugglers, who appeared daily in the city. Claiborne had great difficulty in raising the quota of 1,000 men called for by the President, but finally accomplished it. Congress ordered Jackson to proceed to New Orleans for its defence.

Commerce on the Mississippi was greatly stimulated by the advent of steam navigation. In 1817, 1,500 flat-boats and 500 barges brought the produce of the valley to New Orleans. Four years later 287 steamboats, 441 flat-boats and 174 barges moored along the water front of the city. The American section became the market for cotton, tobacco, pork, beef, corn and flour, while the old city retained control of coffee, indigo, sugar, rice, foreign fruits and wine. In the year 1825, the imports and exports of the city were valued at $17,000,000, and by 1835 at more than $53,000,000, a part of the increase being due to the extraordinary rise of prices throughout the country. The population was cosmopolitan. In 1815 it numbered 33,000 and in 1820 had advanced to 41,000. Commerce increased more rapidly than population because of the absence of manufacturing; between 1830 and 1840 trade advanced 75% and the population only 20%.

In 1847–48 the exports of domestic products from New Orleans exceeded those of New York, although the total exports were less than those of the northern city; but imports at New Orleans were far less.

In 1842 receipts from the interior were valued at $45,700,000 and in 1851 they had increased to $107,000,000. One tenth of the arrivals were now steamships. This trade was carried on in spite of the danger from bars on entering the river; in the space of a few weeks, in 1852, 40 ships went aground at the entrance to the river. The terrible yellow fever epidemics of 1853–55 reduced the volume of trade, which was regained, however, and a high-water mark reached in 1857, to be followed by a financial crash which was disastrous to the business houses of New Orleans.

Louisiana seceded from the Union on Jan. 26, 1861. New Orleans was recognized as a strategic point by the authorities at Washington and two expeditions started to secure the Mississippi for the Union: Grant was to descend the river and Farragut and Butler were to ascend it. The city had sent 5,000 soldiers to the defence of the northern line of the Confederacy but the Southern Government seemed oblivious to the importance of holding New Orleans. While Grant was endeavouring to push his way down stream, Farragut was entering the river from the gulf with a fleet of 43 vessels. The assistance asked by Gen. Lovell could not be given by the Confederacy. An attempt was made to obstruct the passage of the Federal fleet by cables put across the river below the city, but New Orleans was captured by Farragut on April 25, 1862 and the city front blazed with the fire from thousands of bales of cotton and hogsheads of sugar and molasses which were burned to prevent their falling into the hands of the Federals.

Gen. Benjamin T. Butler with 15,000 soldiers took charge of the city on May 1, 1862. Mayor Monroe was removed from office and a military commandant appointed in his place. The city council was replaced by the bureau of finance and the bureau of streets and landings. Butler's rule in New Orleans was execrated by the people of the city and he was removed before the year expired.

The Republican Congress decided that the Southern States should be regarded as conquered territory, reconstructed and admitted to the Union. First of all the new freemen were to be secured in the enjoyment of their citizenship and suffrage. The white men of the State were virtually deprived of the ballot by all the restrictions placed upon its exercise. In the wake of the war came a host of undesirables seeking fortunes by easy means They became known as "carpet baggers," and their Southern friends and associates were known as "scalawags." In New Orleans they gained control of the city government through leadership of the voting population—largely composed of the newly enfranchised negroes. The property of the city disappeared; extravagant expenditures reached $6,961,381 by 1872 and the bonded indebtedness $21,000,000, paying up to 10% interest.

The citizens of New Orleans formed the "White League" for the expulsion of the "carpet-bag" government and for restoring white supremacy. To frustrate their plan an order was issued forbidding a citizen to keep a firearm even in his home. It was rumoured that a ship was to arrive on Sept. 14, 1874, with a cargo of ammunition and the metropolitan police formed at the foot of Canal street with mounted cannon to prevent the citizens from reaching the vessel. The White League formed at Poydras street and moved out to the levee; a skirmish followed in which the metropolitan police were worsted, suffering considerable loss. By gradual successes the White League restored white control.

Improvements made but slow progress during restoration times and for many years after; the city undertook the operation of the water works in 1869; a drainage system was proposed in 1871 but proved too expensive to be carried out; in 1871 the board of park commissioners bought the Upper City park, now Audubon park. The population in 1860 was 168,755 and had

increased by 1870 to 191,418. During this decade many freed Negroes had come to the city from the country districts. In 1870 the fifth and sixth districts were added by the annexation of the town of Algiers on the opposite bank of the river and of Jefferson City (formerly Lafayette), a town adjoining the fourth district. In 1874 Carrollton was admitted as the seventh municipal district, and New Orleans attained its present limits.

In the spring of 1927, New Orleans was saved from a great Mississippi river flood by blasting the levee at Poydras, about 15 mi. below the city, on April 29. This operation sacrificed the adjacent parishes of St. Bernard and Plaquemines at a cost to the city of approximately $5,000,000. To avoid similar danger in the future a spillway was constructed about 35 mi. above the city to remove 250,000 sec.-ft. of water from the river during excessive floods and deliver it into Lake Pontchartrain.

A railway and highway bridge across the river at New Orleans was completed in 1935. (W. B. G.; G. M. CA.)

The Battle of New Orleans.—This was the final engagement of the American War of 1812 (*q.v.*), fought on Jan. 8, 1815, between the forces of the United States, under Maj.-gen. Andrew Jackson, and those of Great Britain under Maj.-gen. Sir Edward Pakenham. The abdication of Napoleon in April 1814 made it possible for Great Britain to give more attention to her American antagonist. The Gulf of Mexico region was selected for the attack, and late in 1814 a fleet of 50 vessels and an army of nearly 10,000 veterans were dispatched to the region of the Mississippi river. The British advance was made by way of Lake Borgne and the Villere canal to the bank of the Mississippi where the advance-guard appeared on Dec. 23, 1814. Jackson was wholly surprised by this movement but with a superior force made an immediate (Dec. 24) attack with such effect that the British decided to wait for the main army and their artillery. This gave Jackson time to fortify a dry canal and to receive additional reinforcements.

At last, in the early morning of Jan. 8, 1815, a direct attack was made on the now strongly entrenched line of the defenders at Chalmette, near the Mississippi river. It failed disastrously with a loss of about 2,000 out of 9,000 British troops engaged, among the dead being Pakenham and Maj.-gen. Gibbs. The British attack on the right bank had been successful but Gen. Lambert, Pakenham's successor, was unwilling to take the responsibility of any further fighting. The expedition was soon abandoned, and by the end of the month the troops embarked for England. The American loss proved to be 71, out of a total of about 4,000 engaged on both sides of the river. The battle of New Orleans had no bearing on the outcome of the war as peace had been made at Ghent 15 days before the battle was fought, but news of the battle and the peace reached Washington almost together. (*See* WAR OF 1812.)

NEW PHILADELPHIA, a city of eastern Ohio, U.S.A., 75 mi. S. by E. of Cleveland, adjoining Dover, on the Tuscarawas river and federal highway 21, at an altitude of 890 ft.; the county seat of Tuscarawas county. It is served by the Baltimore and Ohio and the Pennsylvania railways. The population of New Philadelphia was 12,948 in 1950, 12,328 in 1940 and 12,365 in 1930 by the federal census. Coal and fire clay abound in the immediate vicinity, and the city has important manufactures, including mine equipment, enamelled ware, decorative metal stampings, malleable iron castings, earth-moving machines, plastic products, pottery and adhesives.

On May 3, 1772, a company of Christian Indians which was led by the Moravian missionary, David Zeisberger (1721–1808), came from western Pennsylvania, and three months later John Heckewelder (1743–1823) arrived with 200 more Indians. They laid out the town of Schoenbrunn at the "big spring" a little southeast of the present city of New Philadelphia, built the first church and the first schoolhouse in Ohio and more than 60 dwellings of hewn timber, but were obliged to abandon the settlement in 1777 on account of the hostility of the neighbouring Indians. The site of Schoenbrunn, discovered in 1923, was bought by the Ohio state archaeological and historical society. Other missions were planted in this region at Gnadenhütten (1772), Lichtenau (1776) and Salem (1780). On March 7 and 8, 1782, the 96 peaceful Christian Indians at Gnadenhütten were tricked and brutally massacred by a force of 100 whites sent out from Ft. Pitt under Col. Williamson. At Zoar, 5 mi. N. of New Philadelphia, a settlement was made in 1817 by 225 Germans under the leadership of Joseph Bimeler. In 1824 they organized a communistic society, which lasted until 1898. New Philadelphia was founded in 1804 by John Knisely, from Pennsylvania. It was incorporated as a village in 1815 and chartered as a city in 1896.

NEW PLYMOUTH, municipality and seaport on the west coast of the North Island, New Zealand, capital of the provincial district of Taranaki, 251 mi. N.N.W. of Wellington by rail. Pop. (1953) 22,500 (24,700 including urban areas). The town is noted for its parks and gardens, and the district, sometimes called "the garden of New Zealand," produces cereals and fruit and is one of the chief dairy centres of New Zealand. The settlement was founded in 1841 by the Plymouth company under the auspices of the New Zealand company, and chiefly consisted of emigrants from Devonshire and Cornwall. On the seashore are extensive deposits of ironsand. Mount Egmont (8,260 ft.), 18 mi. from New Plymouth, is well-known for its winter sports.

NEWPORT (Welsh, *Casnewydd*), a municipal, county and parliamentary borough, seaport and market town of Monmouthshire, a county of England which for most administrative purposes is still part of Wales. Newport lies on the Usk, 5 mi. from its confluence with the Severn, and is 12 mi. N.E. of Cardiff and 24 mi. S.W. of Monmouth by road. Pop. (1951) 105,285. Area 12.3 sq.mi. It lies chiefly on the right (west) bank of the river, and on the east, north and west it is sheltered by a line of hills.

An ancient mesne borough and castle, it occupied an important position on the Welsh marches. The town, which is not mentioned in Domesday, grew up round the castle built early in the 12th century. Giraldus Cambrensis, writing in 1187, calls it *Novus Burgus*, probably to distinguish it from Caerleon, whose prosperity declined as that of Newport increased. From Robert Fitz Hamon (d. 1107) the lordship passed to the earls of Gloucester and Stafford and the dukes of Buckingham.

The town received its first charter in 1227, and Hugh le Despenser, who held the lordship for a short time, obtained in 1323 a charter of liberties for the burgesses, granting them freedom from toll throughout England, Ireland and Aquitaine. The earl of Stafford granted a further charter in 1385, confirmed by his grandson in 1427, which gave the burgesses the right of self-government and of a merchant guild. On the attainder of the duke of Buckingham in 1483 the lordship lapsed to the crown, of whom it was held in the 16th and 17th centuries by the Pembrokes, and in the 19th by the Beauforts. The town was incorporated by James I in 1624. In 1385 the borough obtained a market lasting 15 days from the vigil of St. Lawrence (Aug. 10). The charter of 1624 granted two fairs. Newport was the scene of a serious Chartist riot in 1839. The town became a county borough in 1891 and returns one member of parliament.

The old parish church of St. Woollos (since 1921 the cathedral church of the Anglican diocese of Monmouth) stands on Stow hill. Originally it consisted only of the present nave, a fine specimen of grand, though unadorned, Norman architecture; but a massive square tower (of the time of Henry III) and a chancel were added later; a large western Early English lady-chapel is interposed between the nave and the tower.

The castle was greatly altered in the late Perpendicular period and was restored in 1929–30. The old Dominican monastery is entirely rebuilt and occupied as a private residence; but there are a few fragments of a house of White Friars. The town has a

museum and an art gallery. Newport increased rapidly in the later part of the 19th century owing to its situation on a fine tidal river which renders it an outlet for the eastern section of the South Wales coalfields.

There are the Alexandra, North and South, docks with a quayage of 7,839 and 17,189 ft. respectively, and the Town (Old) dock with a quayage of 4,853 ft. The Alexandra docks, opened in 1875, enclose a sheet of water 28¾ ac. in extent. The average depth of water in both Alexandra docks is 45 ft. at spring tides and 35 ft. at neap tides. In the Old dock, begun in 1842, the depths are 30 ft. and 20 ft. respectively. There are two dry docks connected with the Alexandra docks, one being 523 ft. long and 74 ft. wide and the other 453 ft. long and 64 ft. wide. There are three other dry docks, all of them entered from the river. The town grew rapidly during the first quarter of the 20th century under a town planning scheme, and extensive building was carried out at Somerleyton and St. Julian's.

A transporter bridge, opened in 1906, gives 177 ft. clearance and a road bridge, 60 ft. wide, forms the main gateway for traffic from London to South Wales. There is an impounding reservoir at Talybont, Breconshire, with a capacity of 2,567,000,000 gal. Newport's industries were greatly diversified in the 1940s. In 1953 the biggest electrical power station in Europe was completed at Uskmouth and plans were approved for a shipbuilding yard at Newport capable of building the largest type of tanker.

NEWPORT, a market town, municipal borough and county town of the Isle of Wight, England. Pop. (1951) 20,426. Area 24.3 sq.mi. It is near the centre of the island, at the head of the wide estuary of the Medina river, 5 mi. S. from its mouth at Cowes. Industries include plastics and woodwork, milling, brewing and mineral water manufacture. Newport is the centre of the island's agriculture and its harbour is used for import and export business. The church of St. Thomas of Canterbury was rebuilt in 1854 in the Decorated style; the county hall was built in 1938 and the town hall (1816) was designed by John Nash. The grammar school was founded in 1614. The Albany barracks, Parkhurst prison and Camp Hill Borstal institution, the last two in Parkhurst forest, lie north of the town. Newport was probably a Roman settlement, then known as Medina; remains of a villa in good preservation were found in 1926. There are no traces of Saxon occupation and no evidence that Newport became a borough before the reign of Henry II. The first charter was granted by Richard de Redvers between 1177 and 1184, and a second, by Isabel de Fortibus, was confirmed by successive kings. The borough was incorporated by James I in 1608 and the final charter, by which Newport was governed until 1835, was granted by Charles II in 1661. It was represented in parliament in 1295, but no other return was made until 1584, when it regularly sent two members. From 1867 to 1885 it sent one but in 1885 its representation was merged in that of the island. The Saturday market dates from 1184, and there is a Tuesday market. Owing to its facilities for trade, Newport early superseded Carisbrooke (*q.v.*) as the capital of the island.

NEWPORT, a market town and urban district in the Wrekin parliamentary division of Shropshire, England, 19 mi. E.N.E. of Shrewsbury by road, on the borders of Staffordshire. Pop. (1951) 3,744. Area 1.2 sq.mi. It is the centre of a wide agricultural area, with markets for cattle, corn and provisions. Newport is not mentioned in Domesday, but at the Conquest was part of the manor of Edgmond, which William I gave with the rest of Shropshire to Roger, earl of Shrewsbury. Henry I is thought to have founded the borough, at first called New Borough, and the site was probably chosen partly because of the fisheries (Aqualate mere, 1 mi. E. is the largest lake in Staffordshire) which are mentioned in Domesday. Henry II granted all the liberties, rights and customs which the town enjoyed under Henry I; Henry III granted the borough, with the manor of Edgmond, to Henry de Audley. Confirmation charters were granted by Edward I in 1287 and Edward II in 1311. The town was incorporated in 1551 by Edward VI whose charter was confirmed by James I in 1604; but the corporation was abolished in 1883, and a local board was formed which gave place in 1894 to an urban district council. The church of St. Nicolas, Early English and Perpendicular, has a fine tower. Newport possesses a grammar school founded in 1656. To the south of the town are the ruins of Lilleshall abbey, founded in 1145 for Austin canons and presented to the nation in 1950.

NEWPORT, a city of Campbell county, Kentucky, U.S.A., on the Ohio river, opposite Cincinnati and adjoining Bellevue, Dayton, Southgate and Ft. Thomas and separated from Covington only by the Licking river. It is on federal highway 27 and on state highways 8 and 9, and is served by the Chesapeake and Ohio and the Louisville and Nashville railways, trolley and bus lines and river steamers. Population 1940 census, 30,631; 1950, 31.044. It is a residential suburb of Cincinnati and also an industrial area largely given to metal fabrication.

Two miles back from Newport is the city of Ft. Thomas (a U.S. military post, established in 1888 to supersede Newport barracks [1804] and a city of the same name); pop., 10,870 in 1950. A Veterans administration hospital is located on the post.

Newport was laid out in 1791, incorporated as a town in 1795 and chartered as a city in 1834.

NEWPORT, a city of Rhode Island, U.S.A., 30 mi. S. by E. of Providence, occupying the southern end of the island of Rhode Island (or Aquidneck); a port of entry, the county seat of Newport county, a place of great historic interest, and a fashionable summer and autumn resort. Pop. (1950) 37,564; (1940) 30,532, an increase of 5.1%.

From the harbour on the west the city rises to a gently rolling plateau with maximum elevations of about 250 feet. The climate is mild and equable throughout the greater part of the year. The "Old Town," with its narrow streets and 18th century houses, climbs the hill back of the harbour.

At the head of Washington square, or the Parade, stands the old State house (or Colony house, when it was built in 1739), now an historic shrine where Washington, Adams, Monroe and other presidents have been entertained. Near by is the Vernon house (built in 1758, and occupied by Rochambeau during the Revolution), which still has its beautiful mahogany balustrades, panelled chimney pieces and delft-tiled hearths. Rare Chinese murals have been found behind panelling. Trinity church (1725) has a beautiful white spire, tipped with a golden crown. At the head of Touro street (named for Isaac Touro, an early rabbi of Dutch nativity) is the Hebrew cemetery (established in 1677) and farther down the street is a fine synagogue (1763), said to be the oldest in America. The old Friends' meetinghouse, part of which dates from 1699 (the first one built on American soil), is now a recreation centre. In Touro park, near the upper end of Bellevue avenue, is the old stone mill, frequently attributed to the Norsemen but probably erected by Benedict Arnold for a corn mill. Near by is the Redwood library, incorporated in 1747 (a development of the Philosophical society founded in 1730), occupying a building erected in 1750, and named for Abraham Redwood (d. 1788), a Friend who contributed £500 for books. A little farther on is the Casino, and from this point Bellevue avenue, extending south to the ocean, is bordered on both sides with the summer "cottages" of wealthy New Yorkers—palatial structures representing almost every possible style of architecture, set in ancient trees and modern gardens, behind high stone or brick walls or grilled fences. On Conanicut island, west of Newport, is the old town of Jamestown (pop. [1950] 1,757), also a summer resort. Newport's inner harbour, formed by a deep indentation in the western shore, has a depth of about 18 ft. and is almost landlocked.

It is guarded by Ft. Adams on the point forming its western boundary. On Goat island, lying in the entrance of the harbour, is the U.S. torpedo station; and on Coasters Harbor island, farther north, off which the old frigate "Constellation" is moored, are a training station of the U.S. navy, a naval war college and, near by, a naval hospital. Newport is an important naval base.

Newport was founded in 1639 by John Clarke, William Coddington and other Antinomians, who had been driven out of the Massachusetts Bay colony, but first settled at Portsmouth on the northern end of the island in 1638.

In 1640 Portsmouth and Newport united and elected Codding-

ton as governor. In 1644 the two towns with Providence formed a government under a parliamentary charter. In 1647 Warwick was included but the southern towns formed a separate government in 1651. They were reunited in 1654, and a liberal charter was obtained in 1663 from King Charles II.

The first newspaper was published in 1732 by James Franklin (a brother of Benjamin), whose son James in 1758 established the *Mercury,* still published. Between 1739 and 1760 great fortunes were made in the "triangular trade" with Africa and the Barbados, in which rum from Newport was exchanged for slaves in Africa, who were exchanged for sugar and molasses in the Barbados, which were brought back to Newport to be made into more rum. In 1770 Newport's foreign trade was greater than that of New York, but it was entirely destroyed by the Revolution, when the town was in the hands of the British from Dec. 1776 to Oct. 25, 1779. After the evacuation of the British it was occupied by French troops under Rochambeau, and in 1780–81 it was a station of the French fleet. Newport was chartered as a city in 1784; resumed the town form of government in 1787; was again chartered as a city in 1853; and secured a new charter in 1906. Until 1900 it was one of the capitals of Rhode Island. The influx of wealthy New Yorkers began after the Civil War.

NEWPORT, a city of northern Vermont, U.S.A., a port of entry and the county seat of Orleans county; situated at the southern end of Lake Memphremagog, 6 mi. from the Canadian border. It is on federal highway 5, and is served by the Canadian Pacific and the Quebec Central railways, and in summer by lake steamers. Pop. (1950) 5,217. It is a summer resort, a centre for winter sports, a shipping point for maple sugar and farm products, and has several industries. It was founded about 1810 and incorporated as a city in 1918.

NEWPORT NEWS, a city and a port of entry of southeastern Virginia, U.S., on the north side of Hampton Roads and the James river, opposite Norfolk; in Warwick county, but independent of it. It is on federal highway 60; is the tidewater terminus of the Chesapeake and Ohio railway; and is served also by air, bus and truck lines, several ferries and numerous steamship lines.

The origin of the city's name has aroused much discussion. Records of the Virginia company of London placed settlers "along the bankes of the great river between Kequotan and Newportes Newes" in 1619. Off Newport News was fought the first ironclad naval engagement in history, the battle of the "Monitor" and "Merrimac" on March 9, 1862.

Newport News remained a village until 1880, when it was chosen by Collis P. Huntington as the Atlantic deep-water coal-shipping terminal for the Chesapeake & Ohio Railway system. It is the country's principal coal-shipping terminal. The city was laid out in 1882 and incorporated in 1896. Pop. (1950) 42,358.

The harbour, spacious and well protected, is connected with the ocean by a channel 600 ft. wide and 35 ft. deep. Nearly a mile of the water front, at the southern end of the city, is occupied by the great railway terminal, covering 337 ac., and comprising 125 mi. of track, storage space for 5,000 cars, warehouses with 1,725,000 sq.ft. of floor space, and piers specially equipped for handling bunker and cargo coal and other commodities. Farther north on the river are the shipyards, among the largest in the world. There were built many famous U.S. fighting ships and merchant vessels. During World War I Newport News was an important port for supplying Great Britain, France and Italy, and also served as a major supply and embarkation port for U.S. forces. During World War II it was the headquarters of the Hampton Roads port of embarkation.

Newport News is one of the four cities forming the port of Hampton Roads, the principal coal and tobacco port of the United States. Other important items in the export trade are grains and preparations, dairy products, semimanufactures of cotton, oilseeds, lumber, iron and steel manufactures, machinery and vehicles, petroleum, coke, coal tar products and industrial chemicals. In the import trade residual fuel oil looms large, with fertilizer materials, gypsum rock, meat products, inedible molasses, crude rubber and allied gums, unmanufactured tobacco, burlap and jute bagging, mahogany logs, standard newsprint paper, nonmetallic minerals and manganese and chrome ores all representing important items.

NEWQUAY, a seaport and watering place of Cornwall, England, 14 mi. N. of Truro by rail. Pop. of urban district (1951) 9,928. It is on Newquay bay, sheltered to the west by Towan head. The harbour, artificially constructed, and equipped with a jetty and piers, admits vessels of 200 tons. China stone and China clay are exported and coal is the chief import.

NEW ROCHELLE, a city of Westchester county, New York, U.S.A., on Long Island sound and federal highway 1 (the Boston Post road); 16 mi. N.E. of the Grand Central station in New York city. It is served by the New York, New Haven and Hartford and electric railways. The population was 59,725 in 1950, 58,408 in 1940 and 54,000 in 1930. New Rochelle is primarily a residential suburb of New York, with some fine old colonial dwellings still standing, and many beautiful modern residential districts of parklike contour. It is the seat of the College of New Rochelle (Roman Catholic; 1904). The city has an area of 9.9 sq.mi., 9 mi. of water front, and a rolling surface reaching an altitude of 289 ft. Zoning ordinances are in effect, and there is a city-planning commission. Besides three city parks covering 83 ac., there are within the city limits parks, parkways and bathing beaches (including Glen island) aggregating 385 ac., owned by the county. There is comparatively little manufacturing, except for local consumption.

On the landward side the city is fringed by residential suburbs, including Larchmont, Pelham and Pelham Manor. The farm given by the state to Thomas Paine at the close of the Revolution is marked by a monument on the road to White Plains, and the farmhouse is now a museum. On David's island, 2 mi. S.W. of New Rochelle, is Ft. Slocum, a U.S army post. The first settlement of importance on the site of New Rochelle was made in 1688 by Huguenots, some of whom came from La Rochelle. The village was incorporated in 1847 and in 1899 it became a city.

NEW ROMNEY, a municipal borough in the Ashford parliamentary division of Kent, England, and one of the Cinque Ports, 75 mi. E.S.E. of London by the S. Ry. Pop. (1951) 2,356. Area 2.4 sq.mi.

Its harbour was the cause of the early importance of Romney, as it was called before 1562–63, and the annual assembly of the Cinque Ports, called the Brodhull, was held there owing to its central position. At the time of Domesday the archbishop of Canterbury and the bishop of Bayeux were joint lords. Romney owed the maritime service to the king of supplying five ships to serve for 15 days in the year. A confirmation of liberties was granted by John in 1205. The town was incorporated by Edward III and was represented in the parliament of 1265. It returned two members from 1366 to 1832, when it was disfranchised. After Elizabeth's charter of 1562–63 the town was officially New Romney. Important documents relating to the Cinque Ports are in the Guild Hall at New Romney. It lies on Romney marsh, part of a level extending from Winchelsea in the southwest to Hythe in the northeast, which was within historic times in great part covered by an estuarine inlet of the sea. The river Rother, which now has its mouth at Rye harbour, formerly entered the sea here, but had its course wholly changed during a great storm in 1287, and the gradual accretion of land led to the decay, not only of New Romney, but of Winchelsea and Rye as seaports. Romney marsh itself is protected by a seawall, and its guardianship and drainage are in the hands of a special corporation dating from 1462. New Romney, which is now over a mile from the sea, has a large sheep fair in August, but little other trade. Of the five churches mentioned in Domesday only the Norman church of St. Nicholas remains. The Romney, Hythe and Dymchurch railway, of 15 in. gauge, incorporated in 1926, is one of the smallest public railways in existence.

NEW ROSS, a town of Co. Wexford, Ireland, on the Barrow, 2 mi. below its junction with the Nore, 102 mi. S.S.W. of Dublin by the Great Southern railway. Pop. (1946) 4,894. St. Alban built the abbey of Rossmactreoin, which gave rise to the ancient

city Rossglas. There are remains in Rosbercon of a 13th century Dominican foundation. According to Camden, New Ross was founded by Isabella, daughter of Strongbow and wife of William Marshal, afterward earl of Pembroke. A charter granted to it by Roger Bigod in the reign of Edward I was extended by James I and James II. In 1269 the town was surrounded by walls. The fortresses were dismantled by Cromwell, but some remains are extant. The Barrow is crossed by a swivel bridge. The inland water communications reach to Dublin by means of the Barrow and the Grand canal. The Nore is navigable to Inistioge. New Ross has breweries and tanyards, a salmon fishery, and exports agricultural produce. The urban district includes Rosbercon.

NEWRY, a seaport, urban district and market town in County Down, Northern Ireland, on the Newry water and Newry canal at the head of Carlingford lough, 38 mi. S. of Belfast by road. Pop. (1951) 13,264. Area 1.09 sq.mi. The site of an abbey founded in 1175, Newry was granted by Edward VI to Sir Nicholas Bagenal, marshal of Ireland. It had an important strategic situation on the route through the "Gap in the North" by which armies attempted to penetrate Ulster from Dublin, Drogheda and Dundalk. In 1689 Newry was set on fire by the duke of Berwick when in retreat before Schomberg. Charters were granted to the town by James I and James II and until 1898 a portion of Newry belonged to County Armagh. The town is picturesquely situated and contains some very attractive Georgian buildings. Spinning and weaving of linen is carried on in Newry and the adjacent village of Bessbrook, and Newry's many industries also include cotton spinning and weaving and the manufacture of waterproofs, dehydrated potato preparations and other food products. Granite is quarried in the vicinity.

NEWS AGENCY, an agency which supplies news to newspapers, periodicals, clubs, associations or private persons, by telegram, in manuscript, proof, by tape machine or duplicated; less frequently by telephone. A news agency does not itself publish news but supplies information privately to its subscribers.

The paramount virtue of the news agency is that, by supplying material to a large number of subscribers, it spreads the cost of collecting such information among all those taking the service and so puts it on an economical basis: no newspaper could, on its own, afford to maintain the kind of coverage which a great news agency such as the Press association provides. All newspapers rely chiefly on the agencies for the receipt of what may be called formal or expected news: *e.g.*, market returns, city quotations, honours lists and election results.

For general news the agencies cover a larger area than any one journal could. At any one of the smaller London police courts, for example, an interesting or scandalous case may at any moment come up without warning. No private reporting staff could hope to catch every such case but an agency man is almost certain to be in attendance. If, again, it is known that a case or a function is expected in a town where the paper concerned has no correspondent, a "special" may be ordered from an agency. An outstanding example of routine agency work is the coverage given by the Press association's representatives of the dozens of football matches that take place all over the United Kingdom each Saturday between August and May: interest in the games is widespread, but no single newspaper possesses the resources in cash or manpower to enable it to have representatives at each of the many matches of which it will expect reports.

In Great Britain the dominant news agency is the Press association, or the P.A., which is owned co-operatively by the British newspaper press, national and provincial, although its services are available to all. It has special parliamentary and law-court reporting divisions.

The P.A. disseminates home news only. Overseas news is put out by Reuters, with which the P.A. is linked. Although Reuters supplies only overseas coverage to its subscribers in the United Kingdom, it takes the P.A.'s home-news service for dissemination to its subscribers in other countries. There is also a P.A.-Reuters Features and a P.A.-Reuters Photos organization.

Also active in Great Britain on a large scale are the Exchange Telegraph Co., Ltd.: the Associated Press, Ltd., London end of the Associated Press of America (the P.A.'s equivalent in the United States); the British United Press, Ltd., which is associated with the United Press of America; and the International News service.

The Press association and Reuters are established in a large modern building at 85 Fleet street, which also contains the London offices of many of the overseas news agencies. These have clients in Great Britain but are for the most part concerned with the transmission of news from the United Kingdom to their several national newspapers.

Among the important national news agencies of countries outside the United Kingdom are Agence France-Presse, the U.S.S.R.'s Tass (Telegrafnaya Agentsia Sovietskogo Soyuza) and the Irish News agency.

The true news agencies must not be confused with the numerous feature agencies which submit general and specialist articles on a free-lance basis. There are also many governmental and "propaganda" agencies which supply news on a broadcast scale for which no fee is charged: thus most commonwealth and foreign countries maintain services in Great Britain to put out regular daily or weekly bulletins carrying items of a "national" character to which they are anxious to give publicity (such news sheets are mailed off free to editors, who may make use of them from time to time but are aware that, in many cases, they are not of a disinterested character). (K. R. V.)

United States.—The oldest and largest of U.S. news agencies is the Associated Press. Its forerunner was an informal, unincorporated group of New York newspapers which agreed in May 1848 to obtain in one telegraphic dispatch the foreign news brought by ships arriving at Boston, first U.S. port of visit by transatlantic vessels. This co-operation was successful, and the principle was gradually extended. Shortly after an 1856 reorganization, the group came to be called Associated Press of New York; mutual itself, it sold its service to various regional groups. In 1882, however, the Western Associated Press obtained a share in management; ten years later N.Y.A.P. perished in a realignment in which the modern A.P., incorporated as Associated Press of Illinois but operating in both the east and the west, was set up in opposition to the United Press (1882–97). An antimonopoly suit by the *Chicago Inter Ocean* in 1900 caused the dissolution of this corporation, which was immediately supplanted by a new one under New York's more lenient laws. A prosecution for violation of the Antitrust act, founded on complaints of the *Chicago Sun,* was successful in 1942–45; thus blackballing of new members by old ones, and practices similar in effect, were no longer possible. By the 1950s A.P. had some 1,700 members, as well as about 1,000 radio and television stations which were associate members. Though a mutual, it pays many local correspondents connected with member papers.

United Press associations was formed in 1907 by E. W. Scripps as a merger of two of his own agencies and one independent. Under Roy W. Howard's aggressive management (1908–20), the U.P. had obtained more than 1,400 clients before the outbreak of World War II, 130 of them in Latin America and 320 in Europe and Asia. Though not a co-operative, its clients share its news efforts.

International News service was organized by W. R. Hearst in 1909 for morning papers. After repeated shuffling of Hearst services, INS emerged in 1928 as a round-the-clock service. By the 1950s it was said to have in the neighbourhood of 1,000 clients, some in foreign countries.

Besides these three great agencies, there were in the 1950s more than 100 news services, all of which were, in one way or another, more limited in scope. Some were restricted geographically. Some were specialized, as Science service, Religious News service, Educational Newsfeatures, Daily Sports News service, Associated Negro Press. Several large newspapers syndicated their own correspondence through special agencies such as the Chicago Daily News Foreign service, Chicago Tribune Press service and Chicago Tribune-New York News syndicate, New York Times syndicate, and New York Herald Tribune News service.

Reuters was allied with A.P., exchanging its United Kingdom domestic report for A.P.'s corresponding report from the United

States; but each retains the right to market its report in the other's territory as foreign news, and thus Reuters served some 30 U.S. papers with its foreign report at mid-20th century. Canadian Press, founded 1910 as Canadian Press Ltd., exchanged reports with A.P. from its beginning.

Many of the news agencies mentioned handle features as well; likewise the great feature syndicates handle much straight news, as North American Newspaper alliance (NANA) and Newspaper Enterprise association (NEA). The service of the former includes the report of the Kemsley Foreign News service. McGraw-Hill's World News is an agency established 1945 to serve magazines.

Pictures are often quite as much news as word reports. By the 1950s there were some 75 agencies distributing news pictures located in various U.S. cities, more than one-half of them in New York. Prominent were Wide World Photos, organized by the *New York Times* in 1919 and later taken over by the A.P.; Acme Newspictures, NEA subsidiary, founded 1924; International Photos, Hearst unit begun in 1910 and later a subsidiary of King Features.

NEW SCOTLAND YARD: *see* Scotland Yard.

NEW SIBERIAN ISLANDS are situated off the Arctic coast of Siberia, in Yakut Autonomous S.S.R., Russian S.F S.R. from 73° to 76° 6′ N., and 135° 30′ to 151° E. The name is loosely applied, covering either the northern group only of these islands, for which the name of New Siberian or Anjou Islands ought properly to be reserved, or the southern group as well, which ought to retain its name of Lyakhov Islands. Some confusion prevails also as to whether the islands Bennett, Jokhov, Vilkitski, Henrietta and Jeannette, ought to be included in the same archipelago, or described separately as the Jeannette or De Long Islands. The first three of these belong geographically, and probably geologically to the New Siberian group, from which they are less than 100 mi. distant. Henrietta and Jeannette Islands lie 200 mi. northeast of Novaya Sibir Island, in 157° to 159° E. Sannikov Land, reported by J. Sannikov in 1805 to lie north of Kotelni Island, probably does not exist.

The *New Siberian Islands* consist of Kotelni, the largest (116 mi. long, 100 mi. wide), having the small island Byelkovski near its western shore; Thaddeus (Faddeevski), in the middle; and Novaya Sibir, New Siberia, in the east (90 mi. long, 40 mi. wide). Kotelni is the largest and reaches an altitude of 1,200 ft. in the volcanic Malakatyn-tas mountain. It is built of Silurian coral limestones (Llandovery division), containing a rich fossil fauna. The same Silurian deposits are widely spread on the mainland as far as the Olenek. Middle Devonian limestones and slates are all faulted north-northwest and south-southeast. Triassic slates appear in the southeast. Diabases pierce to Devonian rocks. The eastern portion of the island, named Bunge's Land, is covered with post-Tertiary deposits. Novaya Sibir Island attains altitudes of 200 to 300 ft. in its western portion. The so-called Wood Mountains, which were supposed to be accumulations of floating wood, are denudations of Miocene deposits containing layers of brown coal with full stems of trees. These Tertiary deposits are characterized by a rich flora and fauna, testifying to a climate once very much warmer. The only representative of tree vegetation now is a dwarf willow 1 in. high.

The *Lyakhov Islands* consist of Bolshoi, or Blizhni, which is separated by Laptev strait, 27 mi. wide, from Svyatoi Nos of Siberia; Mali, or Dalni; and several smaller islands to the west of Mali. Bolshoi too consists of granite protruding from beneath nonfossiliferous deposits. Along its southern coast Baron Toll found immense layers of fossil ice, 70 ft. thick, evidently relics from the Ice Age, covered by an upper layer of post-Tertiary deposits containing numbers of perfectly well-preserved mammoth remains, rhinoceros, *Ovibos,* and bones of the horse, reindeer, American stag, antelope, *saiga,* and even the tiger, associated with relics of forest vegetation. A stem of *Alnus fruticosa,* 90 ft. high, was found with all its roots and even fruit. Similar deposits of ground ice occur in Vasilievski Island. Basalts and Tertiary brown coal deposits enter into the composition of the southern extremity of Bennett Island; Vilkitski Island is low (50 ft.) and basaltic. Bennett and Henrietta Islands have a few small glaciers. The New Siberian Islands have none.

The climate of these islands is very severe. In 1886 the winter ended only in June, to begin anew in August (May 21, −5.8° F; Oct. 16, −34 6°). The highest summer temperature was 50°. Flocks of geese and other birds come to the islands in summer. The lemmings are numerous. Reindeer, followed by wolves, come across the ice from Siberia; the fox and polar bear feed on the lemmings. The islands have been long known to Siberian hunters who come for furs and fossil ivory. There is much driftwood.

A Yakutsk Cossack, named Vaghin, wintered on Bolshoi in 1712, but it was a merchant, Lyakhov, who first described the two greater islands of this group in 1770, and three years later reached on sledges the largest island of the New Siberian group. which he named Kotelni. M. Hedenstrom, accompanied by Sannikov, explored the archipelago and published a map of it in 1811. Anjou visited it in 1821–23. A scientific expedition under A. Bunge (including Baron E. Toll) explored it in 1885–86. Toll revisited it in 1893 with Shileiko, and again in 1900 with F. G. Seeberg in the "Zarya." The Russian hydrographical expedition in "Taimir" and "Vaigach" in 1912 did some surveys in the New Siberian Islands; in 1913 it discovered Vilkitski Island and in 1914, Jokhov Island. The "Maud" in 1924 visited the New Siberian Islands. (*See* Arctic Regions.)

(R. N. R.-B.)

NEW SMYRNA BEACH, a city in Volusia county, Florida, U.S., 13 mi. S.S.E. of Daytona Beach, on the Atlantic coast. The population was 5,775 in 1950 and 4,402 in 1940 by the federal census. Served by the Florida East Coast railway, New Smyrna Beach is a resort centre. Its principal products include fish, shrimp and citrus fruit.

In 1696 the Mission of Atocuimi was established on the site by Spanish missionaries. In 1767, 1,500 colonists from Greece, Italy and the island of Minorca were brought to the settlement by a Scottish physician, Andrew Turnbull. The colonists were given a ship, £4,500 and 100,000 ac. by the British government as an aid in the development of the settlement. Within nine years the settlers had succeeded in laying the foundation for a new community. They had built a complex canal system and many roads, some of which were still in use in the middle of the 20th century. At the outbreak of the American Revolution, however, discontent with the administration of the community had arisen. The situation became so intense that troops had to be called in and those who wished to leave the settlement were granted permission by Patrick Tonyn, then governor of East Florida. Most of the settlers moved north to St. Augustine. In 1803 the town was resettled; it then expanded slowly under the stimulus of new highways and the completion of the railroad and intracoastal waterway.

NEW SOUTH WALES, a state of the Commonwealth of Australia, lying in the southeast, and occupying 309,432 sq.mi. or 10.4% of the continent. From the east coast (Point Danger-Cape Howe, 700 mi.) to the western boundary which runs for 240 mi. along longitude 141° E., the average breadth is *c.* 650 mi. The northern boundary lies along lat. 29° S. and further east, along the Upper Darling (Barwon-Macintyre-Dumaresq) streams and thence along a crooked line of highland divide (Macpherson range, etc.) to Point Danger. The southern boundary is formed by the middle and upper Murray to the head of the Indi (Forest Hill), thence in a straight line southeast to Cape Howe.

Physiographically four main divisions may be distinguished, corresponding to fairly well-marked climatic and economic areas.

(i.) **Eastern Highlands,** the most striking, as also the most decisive, of the relief features, consists of a belt of plateaux extending from the Macpherson range on the north to the Australian Alps (*q.v.*) on the south. (*See* Australia: *Geomorphology;* Queensland.) In the north the *New England Plateau* (*c.* 200 miles long, 70–80 miles broad, with *c.* 9,000 sq.mi. lying above 3,000 ft.) rises in its centre to *c.* 5,000 ft.—Ben Lomond,

4,877 ft.; Mount Capoompeta, 5,100 ft.—sinks at either extremity to *c.* 4,000 ft.; Mount Lindsay (Macpherson Range), 4,583 ft.; Oxley's Peak (Liverpool Range), 4,500 ft.—and has considerable outliers, on the west the volcanic Nandewars (4,000 ft.) and Warrumbungle Range (3,000 ft.), and on the east and south the semi-detached spurs carved out by stream erosion into the likeness of ranges—Hastings, Mount Royal, Liverpool, etc., "Ranges." To the south of these ranges the plateau belt is broken across and the Central Plateau is separated from the more northerly by the remarkable Hunter River valley, the saddle at the head of which (near Cassilis) lies at *c.* 1,500 ft. The *Central Plateau* extends from this gap to the Lake George depression just north of the Federal Capital Territory. In general it repeats the features of the New England Plateau (*cf.* volcanic outliers on the west: Canobolas group, *c.* 3,000 ft.) but it is smaller and lower, few areas rising above 4,000 ft., and altitudes vary considerably. Its north-eastern section, the Blue Mountain Plateau, capped with (Triassic) sandstone, tilts from 4,000 ft. (west) to 700 ft. (east). From the Lake George fault-depression ("Senkungsfeld") to the border extends the *Southern Plateau,* a portion of the Australian Alps, a series of massive flattish-topped blocks diversified by (mainly north to south) down-faulted depressions (Mount Kosciusko, 7,328 ft.). Geologically this highland belt is characterised by its prevailingly ancient rocks (pre-Cambrian granites, folded Palaeozoics, etc.); by the volcanic flows (basalt, trachyte, etc.) which form cappings over considerable areas; by the extensive faulting which has differentiated levels, dislocated former drainage and resulted, in particular, in the abrupt scarps and declivities of the eastern flank; by the flattening by erosion (peneplanation) of the surfaces.

(ii.) **The Coastal Lowlands** belong structurally to the highland belt, being mainly, perhaps, down-faulted portions of it. The coast-line also appears in certain stretches (*e.g.,* in the south) to be fault-determined. Almost everywhere the plateaux behind break away in sharp declivities and form steep backing walls often scarred by deep gorges. The coastal lowlands are mostly narrow (10–20 miles)—often mere deltaic fringes at river-mouths. In three places—around Sydney, Hunter River, Clarence-Richmond-Tweed rivers—they form roomier basins in which later rock-formations (*e.g.,* Triassic) have been preserved. The Hunter-Goulburn Valley is a down-faulted trough worked out by erosion in weak strata and breaks across the highlands, running almost straight south-east to north-west for 120 miles to the Cassilis saddle (*v. sup.*) and is floored in its lower part with deltaic deposits. The structure of the Hunter Valley and of the Sydney Basin accounts for the outcropping of valuable coal seams. The coast-line, backed in many parts by bold heights, consists mainly of a succession of rugged promontories alternating with sandy bays and some inlets. In the central portion, on the other hand, subsidence has produced fine drowned valley harbours (Sydney, Port Stephens, Broken Bay, etc.).

(iii.) **The Western Slopes** are the "ramp" of the eastern plateaux, their uneven but relatively gentle declivity towards the great interior plains. In addition to outliers of the highlands (Mount Exmouth group, Curumbenya Range, etc.) the Cobar (*c.* 300 miles south-east–north-west; 150 miles wide; altitude 500–1,000 ft.) and Wyalong peneplains—worn-down relics of the buckled ancient floor which protrude through the later surface deposits—are the chief irregularities, though the streams have excavated long and broad transverse furrows.

(iv.) **The (Western) Plains** occupy all the remainder (nearly ⅔) of the State except along the western edge where the Barrier "Range" (*c.* 100 miles north to south; 30 miles east to west; altitude *c.* 1,000 ft. or 500 ft. above the surrounding plains) forms a series of hard etched and scarped ridges and resembles in structure the Cobar "peneplain." The immense plains—substantially the basins of the Upper Darling and a good part of that of the Murray—are floored with recent deposits (probably residuals of an earlier and wetter epoch). The western portions, and the older and higher of these deposits, are prevailingly red and are generally fertile. Black soils are found in the river valleys (*e.g.,* middle Macquarie, Castlereagh, Namoi, etc.) and along the silted-up courses of old streams. The streams, meandering, distributing, and flooding wide over these levels, are continually spreading fresh alluvium. The northern portion (80,000 sq. miles) reaching south-eastwards to Dubbo, falls within the Great Artesian basin, and the south-western parts (Riverina) fall within the Murray-River artesian area. In the former area bores vary from *c.* 90–4,340 ft. (av. *c.* 1,750 ft.), while 380 flowing wells discharge 80,780,000 gals. a day (maximum for single well, 1·5 million gallons).

Of the rivers the coastward-draining are relatively short, the Hunter and Wollondilly, each *c.* 340 mi. are the longest—rapid and constant-flowing streams, and owing to recent (Pleistocene and earlier) uplift, they are vigorously cutting back and excavating deep canyon-like gorges in the plateaux behind (*cf.* upper Macleay gorge, 3,000 ft. deep), creating wild and beautiful scenery and opportunities for the development of water-power. The lower basins are undulating to hilly with rich alluvial flats. Sand-barred mouths are common and also lagoon-like lakes (*e.g.,* Lake Macquarie) due to damming of mouths by marine drift. (*Cf.* south to north current along the coast.) Few are navigable for any great distance and then usually for small craft only (*e.g.,* Hawkesbury, 70 miles; Macleay, 39 miles; Shoalhaven, 22 miles). *See* also RICHMOND RIVER AND BASIN. The inward-flowing streams have been referred to. (*See* AUSTRALIA: *Rivers and Drainage.*) Of the Murray, 1,200 miles are within New South Wales. Recent measurements have given the following results: Darling, length 1,160 miles, drainage area 221,700 sq. miles; Murrumbidgee, 981 and 10,700; Lachlan, 922 and 10,420; Macquarie, 590 and 10,090; Namoi, 526 and 9,820.

Climate.—Situated wholly in the temperate zone, New South Wales has a generally moderate climate. Average temperatures are higher by 5°–7° F in the north than in the south, and the range increases towards the interior, the mean daily range on the coast being *c.* 19° F, in the western plains *c.* 26° F. The transition zone between summer and winter rains passes diagonally (north-west to south-east) through the State. The area south-west of the line Broken Hill-Wagga-Albury receives winter rains mainly from Antarctic depressions ("lows"); the area north-east of a sinuous line running from the north-west corner of the State to Newcastle receives summer rains from tropical (monsoonal) "lows"; the intervening belt receives rain from both quarters and, in the east, from the passage of anticyclones ("highs") also The east receives much more rain, and more uniformly, than the interior, the isohyetal lines except in the south and south-west running roughly parallel with the coast. The extremes are in the north-east corner (80 in. per ann.) and in the north-west (7 in.). Only 42% of the total area receives an average of over 20 in. per ann.; 15% receives less than 10 in. which is also more or less erratic. Heavy rains cause extensive flooding of the streams resulting often in serious loss; droughts are also a recurrent difficulty, especially in the interior. The rate of evaporation increases from *c.* 40 in. a year on the coast to *c.* 100 in. in the north-west with concomitant seasonal aridity and the drying up of streams. Four main climatic divisions, corresponding to the physiographic, may be distinguished: (i.) *Coast:* relatively high and regular rainfall coming mainly from the sea, with mild and humid conditions. Av. ann. temps., in the north 76°–57° F, in the south 68°–51° F; rainfall 30–80 in. per ann., greater in the north. (*See* LISMORE, NEWCASTLE, SYDNEY.) (ii.) *Tablelands:* cool and bracing climate with cold winters in the south; uniform and reliable rainfall. Average ann. temps.: in the north 70°–45° F; in the south 63°–38° F; av. ann. rainfall, 40 in. in the east to 30 in. in the west. (*See* BATHURST.) (iii.) *Western Slopes:* a drier, sunny and healthy climate with uniformly distributed rainfall. Temperatures are higher in the north, summer: 81°–73° F, winter, 53°–46° F; rainfall (av. ann.): 30 in. in the east, 20 in. in the west. North of the Lachlan the rains come from the north in February–May; the Riverina has light, but fairly reliable, winter showers. (*See* ALBURY.) (iv.) *Western Plains:* a dry climate, invigorating in winter, but liable to suffer from droughts, dust-storms and, more locally, from floods. Temperatures are higher in the north—av. ann.: summer 84°–75°; winter 54°–49° F. Av. ann. rainfall from 7 in. in the north-west; 10–15 in. along the Darling; 20 in.

in the east. (*See* BROKEN HILL.) (*See* AUSTRALIA.)

Economics.—The general facts relating to the distribution of minerals, soils and natural vegetation have been given under AUSTRALIA (*q.v.*). The clear physical differentiations indicated above, together with the stage of growth attained, give the economic development of New South Wales a marked regional character. Climate, relief, location of minerals and accessibility (*i.e.*, communications) are dominant factors in the distribution of the population. The following survey therefore proceeds upon the basis of four regions, viz., Western Plains; Central Plains; Tablelands; Coastal Lowlands. The last three occupy belts roughly parallel with the coast line and admit of subdivision into north, central and southern sections.

Western Plains, occupying the west and northwest portion (80,312,000 ac. = 125,487 sq.mi. or $\frac{2}{5}$ of the state) west of the courses of the Lachlan, Bogan, and Upper Darling (Barwon) rivers, has abundance of good soils but a poor and unreliable rainfall—8–19 in.; under 10 in. over $\frac{1}{3}$ of its area—and suffers occasionally from fierce heats, droughts, floods and always from introduced rabbits. Mining and pastoral pursuits alone have importance. In the northwest is Broken Hill (*q.v.*); the once-famous Cobar-Nymagee copper area, which is just included in the east, has suspended production, and opal mining (White Cliffs, etc., in the northwest; Lightning Ridge field—12,000 acres—in the northeast) is depressed (output 1926: £11,500). It is an area of isolation, "wide open spaces," large long-term leaseholds, over 63% of the total area being occupied by 196 holdings of over 100,000 acres each. The country produces fine-woolled merinos, but its carrying capacity varies greatly with the seasons and is generally low (40–130 sheep per sq.mi. according to season, or $\frac{1}{5}$ of that of the lands further east). The livestock (1939) consisted mainly of 5,966,000 sheep, 63,000 head of cattle and 25,000 horses. The total population was 44,500 (1 person per 3 sq.mi.; without Broken Hill, 1 per 7 sq. miles) or 1.9% of the population of the state, Broken Hill alone accounting for 26,925. Apart from this the settlements consist mainly of collecting and distributing centres for pastoral areas situated on railway lines (Cobar, etc.), on rivers (Wilcannia, Wentworth), or on both (Bourke, population [1933] 1,778; Walgett, Menindee, etc.) besides isolated stations and mining camps. Railways link Bourke, Cobar, Walgett and other towns on or near the eastern boundary—rivers with the eastern parts of the state and with Sydney, and the recently completed line from Sydney to Broken Hill (Condobolin-Ivanhoe-Menindee) traverses the heart of the area (east to west) and should help to develop much territory. Though increasingly tapped by railways the Darling still carries traffic (*e.g.*, wool to South Australia) in good seasons, and for the rest transport is by camel etc., train—increasingly by motor—over rough tracks.

The Central Plains form a natural extension of the western, large portions of them being little distinguished as regards relief from the latter. Thus in the northwest they comprise the low flat lands stretching east of the Barwon-Bogan rivers, and in the southeast the broad Riverina plains are only divided from the western plains by the Murrumbidgee and Lachlan rivers. Further east the land slopes gradually up, but, except in the centre (Cobar-Wyalong area) there is little above 1,000 ft. and few rugged features. But its rainfall, though rather scanty and unreliable, is better than that further west (15–24 in., the greater quantity in the north—18–28 in.—being balanced by greater evaporation). The rivers from the highlands further east stream across these lowlands but are of no great service, being irregular in flow, entrenched in places, and liable to flood. Artesian supplies have proved a great boon and have been extensively exploited, especially in the northwest and southwest. The soils, red-brown loams and black soils, are good but the latter are very heavy and have only recently begun to be worked. Of the total area (*c.* 41,420,000 ac. = 64,719 sq.mi.) some $\frac{9}{10}$ are occupied, of which 62% has been alienated from the crown, and though holdings of 10,000 acres and upwards account for 19% (89 over 50,000 ac. each), medium to small-sized holdings are common further east and particularly in the Riverina. The area, in fact, forms a climatic and economic transition zone. In the west pastoral pursuits; in the east, mixed agriculture and grazing; in the Riverina and a few other parts agriculture alone, or dairying alone, are practised. The area contains 40% of the agricultural lands of the state; and in the northwest and southwest portions are some of the best sheep-lands. Along the east the fringes of the wheat-belt are included. The 10-in. winter rainfall line (7 months: April-October, the growing season) runs roughly down the middle (north-northeast–south-southwest) of the area, and to this the wheat "frontier" approximates, falling behind it in the northeast but overstepping it to the extent of 5,000,000 acres and pushing forward into rainfall areas of 8–9 in. (April–Oct.) in the centre and particularly in the southwest (Riverina). Thus, while grazing, with a little mixed and other farming, predominates in the north, mixed farming—mainly sheep and wheat—arable farming, fruit-growing (vines, etc.) and dairying increase in importance in the south. A special place, in virtue of its irrigation areas, and its wider range of possibilities, is taken by the Riverina (*q.v.*). The total livestock amounted (1939) to 13,939,000 sheep, 200,000 cattle, 116,000 horses, 9,000 dairy cattle, but the numbers vary greatly according to season (*e.g.*, sheep: 1891, 25,000,000; 1921, 14,000,000; dairy cattle: 1911, 48,000). Similarly the sheep-carrying capacity, though high (266.6 per sq.mi.) varies from 351–205 per sq.mi. With a total population of 115,640, the area had (1926) a density of 1.8 persons per sq.mi. The chief settlements, apart from the pastoral river centres common to this and the Western Plains (Walgett, Hillston, Balranald, etc.), are centres of mixed pastoral and farming areas: Moree (4,355 in 1933), Narrabri—a railway junction town in a sheep, dairy, and fruit area, with butter factories and freezing works—and Coonamble in the north, Nyngan and Condobolin in the centre, and a large number of similar settlements in the Riverina.

The Western Slopes consist in the main of gently rolling country which rises from levels of under 1,000 ft. to elevations of over 2,000 ft. and merges into the plateaus to the east. It is essentially the zone of the upper, and fairly roomy, basins of the western rivers, but in the northwest and southwest the narrower head-water valleys and plateau margins are included in the administrative division. The rainfall is abundant and also fairly reliable (19–34 in.—rather more in the north, 24–33 in., more varied in the south where the Australian Alps are approached: 16–40 in.). The outcrops of ancient rocks along these slopes, as also the stream-beds descending over them, have yielded rich stores of minerals, and Forbes, Temora, Wyalong, Grenfell, etc., were once famous mining centres. Some gold-mining is still carried on, tin is obtained at Ardlethan, chrome iron at Gundagai, and a little coal is worked near Gunnedah. But in general mining has been succeeded by agriculture as the value of the red soils for wheat has become known. Out of the total area, 28,164,000 ac. (*c.* 44,000 sq.mi.), $\frac{9}{10}$ is occupied. Wheat, needing dry summers and an optimum growing season (April–Oct.) rainfall of 11–15 in., finds these conditions in a belt *c.* 500 miles long (northwest–southeast), about 100–130 mi. wide, and limited on the east by a line about 120 mi. from the coast, the coastal portions having proved too humid. Within this belt are 53,000,000 ac. of which about 26,000,000 ac. seem capable of cultivation, and of this $\frac{1}{5}$ would normally be used for growing wheat-hay (fodder). The area of possible wheat cultivation has greatly increased, nearly 20,000,000 additional acres having been occupied for this purpose in 1904–22. The total area actually cultivated to wheat (1939) is about 5,000,000 ac., about one-half of which is under wheat at any time. Fruit-growing and dairying are also carried on, and along some of the rivers irrigation also (*e.g.*, Forbes, Dubbo, Ardlethan). Grazing (mainly sheep) is everywhere important. The great bulk of the holdings within the area lie between 100 and 3,000 acres. Livestock total: sheep, 15,670,000 with the very high average density of 389 per sq.mi.; cattle, 361,000; horses, 159,000; dairy cattle, 55,000. In addition to primary production there are butter-factories, freezing works, flour and saw mills, etc., and in certain railway centres (*e.g.*, Junee, Quirindi) are large railway engineering works. The total population (1933) was 243,000 (5.5 per sq.mi.). The towns (Tam-

worth, 9,913 in 1933; Dubbo, 8,344; Forbes, 5,355; Parkes, 5,846; Junee, Cootamundra and Temora, 3,823) are centres for agricultural and pastoral producing areas, adding often the functions of railway junctions, mining, and (on a small scale) industrial centres.

The Tablelands extend to the east of the above division and are bounded on the east almost everywhere by abrupt and often rugged and precipitous declivities. They include much level or rolling country capable of cultivation but much, especially in the south (ALPS, AUSTRALIAN, *q.v.*), is too rough for anything but grazing. The climate is also cool or cold and, though bracing, tends to be wet. (Rainfall, 24–53 in.; in the north 30–38 in.; in the south 19–65 in.) Mining, formerly extensive, is still important. The tin resources of the Northern plateau (Tingha, Emmaville) are actively exploited; silver ores of high quality are mined at Yerranderie (Burragorang valley); gold is mined at various places: Bathurst, Uralla, etc.; the iron deposits of Cadia (reserves 10,000,000 tons) and Carcoar are utilized in the industries of Lithgow (*q.v.*) and smaller deposits exist at Goulburn and Queanbeyan, while the most westerly outcrops of the Sydney Basin coal deposits crop out and are worked at Lithgow. Of the total area (26,480,000 ac.=41,375 sq.mi.) about 77% (20,000,000 ac.) is occupied, but less than one-half is alienated from the crown. The climate is, in general, too damp for wheat but such as is grown is also found mainly in the central area. Sheep-grazing is carried on from north to south, though the central parts lead in this also. The highlands favour a different type of sheep from the plains—not so robust but of exceptionally fine and dense wool. The New England wool, being reputed to be one of the best of all spinning wools, and the Southern Tablelands (*e.g.*, Monaro district) are also noted. The area carried (1939) 12,122,000 sheep (292.9 per sq.mi.); 427,000 cattle; 94,000 horses, and 42,000 dairy cattle. Apart from Lithgow (*q.v.*) manufacturing industries (flour milling, tanning, soapmaking, railway engineering, etc.) are confined mainly to the larger towns, but the noted beauty of the scenery and the relative coolness of summer attract numerous visitors and in the areas within easy railway reach of Sydney and Newcastle the tourist industry is important. The towns and settlements are centres for pastoral, agricultural, and mining districts; many are tourist centres as well, while some are also railway-junction towns with a certain industrial activity. In the Northern Plateau, Armidale (*q.v.*: 6,794 in 1933), Glen Innes (5,352) and Tenterfield are on the main northern railway (Sydney to Brisbane) and combine most of these functions, serving as holiday centres especially for Newcastle and the north coast towns. On the highlands west of Sydney (Blue plateau) holiday and tourist resorts are more important—Katoomba (6,445); Goulburn (14,849), also an agricultural centre with some industries—while further west, Bathurst (*q.v.*, 10,413) and Orange (9,634) combine this with the other functions mentioned. Further removed, such towns as Cowra (5,056), Young (4,011), Mudgee (3,993), Wellington (4,320) are rather more agricultural and pastoral (wheat and sheep) centres and belong almost as much to the Western Slopes division. Lithgow (*q.v.*, 13,444) with its iron, steel and other industries stands rather apart as an outlier of the coastal industrial areas.

Production.—In 1926 production was: wool, 79,230,000 lb.; wheat, 2,100,000 bu.; butter, 4,136,000 lb.; minerals, £1,322,000; manufactures, £2,687,000. The Federal Capital territory falls within this area (*see* CANBERRA) and was formerly mainly devoted to grazing (sheep). On the edges of the southern tableland (west of Yass) is the famous Burrinjuck dam, the headworks of an important Riverina (*q.v.*) irrigation scheme.

The Coastal Lowlands, irregular, broken and detached patches or mere strips scattered and stretched along the eastern margins, are yet economically and in general social respects perhaps the most important regional element in the state. Relatively small in extent (22,237,000 ac.=34,745 sq.mi.) they contained about 1,770,000 persons (75.7% of the total pop., 1926; 43.4 per sq.mi.); the great majority of large towns, including the capital; nearly all the coal fields and manufacturing areas; all the sugar-growing, the bulk of the dairying and maize-growing areas, besides all the seaports, with the financial and commercial nerve-centres of the state. The largest, and also the most important, individual areas are the Sydney and Hunter river lowlands in the centre, the Clarence-Richmond-Tweed basins in the north, and the Illawarra district in the south (*see* SYDNEY; SINGLETON; RICHMOND RIVER AND BASIN; WOLLONGONG). The climate is mild and humid, and distinctly warmer in the north (rainfall: 30–62 in.; 35–76 in. in the north, 27-61 in. in the south). Apart from river bottoms and some coastal flats, the terrain is hilly or broken and the cultivable area is small, and of this area less than a quarter was cultivated in 1925–26. The broken lands—tableland scarps, valleys, foothills, etc.—are valuable for mining (*e.g.*, Clarence valley) and the intersection and laying bare of coal seams by river action and coastal faulting is a fact of importance. The extensive timber resources have been greatly depleted, though some timber is still cut in the Northern and Hunter valleys. In many parts the topography and climate offer facilities for water-power development (*cf.* Nymboida-Clarence scheme), while the rougher interior country is also used for cattle. Wheat and sheep are virtually excluded by the dampness of the climate, but 95% of the holdings used for dairying are in this area. All the sugar grown in the state is cultivated in the northern corner (1938: 21,000 ac.). Considerable quantities of fruit are grown—tropical fruits in the north, vines, oranges, etc., in the (northeast) Hunter valley and in the Sydney basin—and mixed agriculture is practised (maize, lucerne, potatoes in the north and centre). Livestock (1939): cattle, 695,000; dairy cattle, 962,000; horses, 154,000; sheep, 1,342,000. The holdings are comparatively small: 400–500 acres. The outcropping of coal in convenient positions has given rise to a coal-mining and coal-exporting industry (*see* BULLI; MAITLAND, WEST AND EAST [with CESSNOCK])—in 1938 very depressed—and more recently to growing manufacturing industries centred chiefly in or near Newcastle, Sydney, Port Kembla (*q.v.*). Here is the chief and growing industrial "hub" of the commonwealth. Here, also, are the financial and commercial headquarters —the central banking, wool-broking, railway and shipping, political and social organizations—of the state. Of ports, Sydney and Newcastle—the former good, the latter indifferent as a harbour—are the most important, but Grafton (a river port), Coff's Harbour and Byron Bay in the north have actual importance or possibilities as outlets for local trade and the same applies to Port Stephens as a possible outlet for the lower Hunter district. Jervis bay is the destined site for the port of the federal capital. Associated with the coasts are also fishing (mainly in the northern estuaries and lakes; 1938: £620,000), and the tourist and holiday-resort industries. Of the total population of the area (*v. sup.*) Sydney alone accounts for 1,235,267 (1933), and about 200,000 more inhabit the Sydney basin (Cumberland county). The lower Hunter valley and coasts immediately north of it (*i.e.*, substantially the Newcastle [*q.v.*]-Maitland [*q.v.*] district) count a further 280,000.

Of northern towns Lismore (*q.v.*, 11,762 in 1933), Grafton (6,411), Casino (5,287) are important centres, while in the south Nowra, Wollongong, Kiama are local exporting centres and health resorts.

Statistical Summary. *Area*—excluding Federal Capital Territory; including 176 sq.mi. of harbours—309,432 sq.mi., 10.40% of total area of Australia.

Population (June 1933): 2,600,847; 8.4 per sq.mi.; *c.* 48% of commonwealth; rate of increase (1926), natural 1.34%, natural+immigration 2.14%; metropolitan 45.6%; 99% of area contained (1926) only 655,300 inhabitants.

Occupations (Census 1933: total population 2,600,847; main classes only); *Breadwinners:* 46.5%; *Primary Producers:* 14.3% (agricultural with pastoral and dairying, 9.9%; mining, 3.8%). *Industrial,* 39.3%. *Commercial and Transport,* 26.7%.

Production (1938–39): Total, £165,165,000. *Primary Industries:* £74,899,000 (pastoral, £24,894,000; agricultural, £18,459,000; dairying—including pigs, bees, poultry—£16,359,000; mining, *c.* £11,700,000; forests, fisheries, etc., £3,485,000). *Manufacturing Industries:* £90,266,000. Production per head of population: *Primary:* £27.7.11 (pastoral, *c.* £9; agricultural, £7; dairy-

ing, £6.0; mining, £4.5.7). *Manufacturing:* £33.0.4. *Total:* £60.8.3.

Pastoral Industry (1939): *Sheep,* 48,877,000 (highest was in 1891, 61,831,000) including 40,861,000 merino; Wool, 437,000,000 lb. = £20,679,000 (at Sydney); average weight of clip, 7.8-8.8 lb. *Cattle:* 2,811,000 (including 1,068,000 dairy cattle). *Horses:* 548,000. *Milk:* 311,000,000 gal. *Butter:* 119,000,000 lb. *Cheese* c. 7,500,000 lb.

Agriculture: Area under cultivation (1939): *c.* 10,200,000 ac. (crops alone, 7,050,000 ac.). Wheat, 4,650,000 ac.; 59,898,000 bu.; £6,695,000 = 36.3% of total agric. produce. Hay, 973,000 ac.; 1,200,000 tons; £4,252,420 = 23%. Maize, 120,000–166,000 ac.; 3,280,000–4,600,000 bu.; £630,000–894,000 = 2–4%.

Mining: Total value of all minerals produced to end of 1938 = *c.* £513,000,000. Total output (1939), £12,000,000; (silver-lead, £3,520,000; zinc, £1,360,000); coal, £6,768,659 (northern fields, 7,000,000 tons; southern and western, etc., 3,800,000 tons).

Manufacturing Industries (1911 and 1939–40): Factories: (1911) 5,000; (1939–40) 9,458. Employees: 66,000 and 239,000. Raw materials and fuel: £15,600,000 and £134,453,000. Value of output: £25,700,000 and £239,000,000. Employees: Metallurgical and machinery, 184,000; clothing and textiles, 137,000; food, drink, etc., 87,000.

Communications—Railways: Total mileage open 1939 (including Federal and private lines), 6,210 miles (4 ft. 8½ in. gauge, 6,141) = 1 mi. railway per 400 inhabitants or per 50 sq.mi. Av. ann. increase of mileage, 155.38 miles. Total capital expended (1939), £149,238,000. Net earnings: £6,108,000 = 4.10% interest on capital invested.

Trade: Total (1935–39), £78,000,000–£112,000,000. (Imports £40,000,000–£63,000,000; Exports £37,000,000–£57,000,000.) Per head of population: £29–£41 (Imports: £15–£23; exports: £14–£21).

Exports: Wool: £17,000,000–£27,000,000 = 45–55% of total exports.

Wheat and Flour: £4,000,000–£7,000,000 = 10–14%. *Meat, hides, leather,* etc.: £5,500,000–£6,700,000 = 12–13%. *Butter: c.* £2,000,000 = 3–4%. *Coal:* £350,000 (falling) = 1.0%. *Other Minerals: c.* £3,000,000 = 5–6.5%. Total staple products £25,700,000 = 61% of total overseas exports.

Shipping (all classes): *c.* 3,300 vessels; 11,000,000 registered tonnage, discharging 6,100,000 tons and shipping 5,400,000 tons cargo.

Social Conditions: Hospitals: private: 549 (beds: 5,224); public, 207 (13,792). Total (government) expenditure on charitable relief (1938–39): £7,898,000 = £2.17.9 per head of population. (Maternity allowances: £167,000; State wards [children]: £760,000; Hospitals, asylums, etc.: £1,150,000; pensions: £6,400,000). State advances for building homes (1926): £1,620,000. Parks, recreation grounds, etc.: 240,000 ac.

Education: Schools (1938): public, 3,283; private, 746. Pupils: public, 367,052; private, 100,720 = 92% of those requiring instruction. (O. H. T. R.; G. TR.)

HISTORY

Early History.—New South Wales was discovered by Captain Cook on April 28, 1770 (*see* AUSTRALIA). On Jan. 20, 1788, the "Sirius," commanded by Captain Arthur Phillip, R.N., reached Botany bay with an armed trader, three store-ships and six transports. The persons on board the fleet included 40 women, 202 marines of various ranks under Major Ross, five doctors, a few mechanics, and 756 convicts. The livestock consisted of one bull and four cows, a stallion and three mares, some sheep, goats, pigs and a large number of fowls. The expedition was well provided with seeds of all descriptions. As Botany bay was found unsuitable, the settlement was transferred to Port Jackson, to the present site of Circular quay. Later, other convict-ships arrived; and, in 1793, came the first free settlers, who were presented with grants of land. By 1800 the population was 5,000.

In 1809 Captain Macquarie became governor, and, during his administration, New South Wales was transformed from a penal settlement to a colony. Schools and churches had already been erected, a newspaper, the *Sydney Gazette and New South Wales Advertiser,* had been started, and attempts made to acclimatize the drama. Macquarie was the first governor to open up the country. He formed roads and built bridges in the districts along the coast, and commenced a track across the Blue mountains. Attracted by the success of Captain John Macarthur with merino sheep, more free settlers began to arrive in 1817; but not until the governorship of Sir Richard Bourke (1831–37) did they obtain trial by jury, free press, a legislature with very limited representation, free grants of land, and religious equality. Settlement had progressed at a rapid rate. Parramatta, Richmond and Windsor were founded before 1798, and Newcastle, Maitland and Morpeth early in the 19th century; but the towns of the interior, Goulburn, Bathurst, and others were not begun till about 1835. Then, again, the explorations which followed the passage of the Blue mountains opened up a large portion of southeastern Australia. By 1840, owing to the formation of other colonies, New South Wales, which originally signified the mainland of Australia and the islands in the South Pacific, comprised only the three eastern states of today. Sale by auction of the public lands was now substituted for free grants; and squatters were allowed to occupy sparse areas on payment of a small annual licence. In 1851, when Victoria became a separate colony, the population of New South Wales had risen from the 76,793 of 1837 to 187,243, and the annual exports amounted to £2,399,580. In 1851 also, gold was discovered near Bathurst by E. H. Hargraves, and transportation was at last abolished.

The New Constitution bill was passed in 1853, and two years later, approved by the British parliament. The bill provided for an elected assembly and a nominated council; vote by ballot was introduced; the number of members in the assembly was increased to 80, and the franchise was granted to every adult male after six months' residence. The census of 1857 gave the population of Sydney and suburbs as 81,327. In 1859 Queensland was constituted a separate colony.

From 1861 to 1888.—After 1861 the land policy was entirely revised. Sir John Robertson, in his Land bill, introduced the principle of deferred payments for the purchase of crown lands. Residence and cultivation were considered more important than a sufficient price. After much opposition the measure was passed and the other colonies adopted similar legislation. The distinction between the descendants of convicts and the descendants of free settlers was now finally abandoned. In 1862 a large force, military and police, was despatched to Lambing Flat, in order to protect the Chinamen from ill-treatment by the miners. Bushranging became frequent, and only with great difficulty was stamped out.

H.R.H. the duke of Edinburgh visited the colony in 1868. An attempt was made upon his life by a man named O'Farrell, who was subsequently hanged. A census taken in 1871 showed that the population was 503,981, and the exports £11,245,032. During the governorship of Sir Hercules Robinson (1872–79) the Fiji Islands were annexed; telegraphic communication with England and mail communication with the United States were established, and a coalition between Sir Henry Parkes (premier and colonial secretary) and Sir John Robertson at length made it possible to develop some continuous policy. The census of 1880 gave the population of the colony as 751,468, of whom 411,149 were males and 340,319 females. In this year the railway to Melbourne was completed, and in 1883 valuable deposits of silver were discovered at Broken Hill. In 1885 the British government accepted the offer of a contingent from New South Wales to aid the imperial troops in the Sudan. The railway to Queensland was opened in 1888 by the new governor, Lord Carrington. In the same year the government prevented the landing of some Chinese passengers and passed laws practically prohibiting the immigration of Chinamen.

Federation.—In 1889, the premier, Sir Henry Parkes, gave his support to the movement for Australasian federation, and New South Wales was represented at the first conference held in Melbourne at the beginning of 1890 (*see* AUSTRALIA). Early in 1891 the great strike, which at one time had threatened to paralyse the trade of the colony, came to an end. A board of arbitration and conciliation to hear and determine labour questions and disputes

was formed, and by later legislation its powers were strengthened. (For labour legislation *see* AUSTRALIA.) The census of 1891 showed that the population was 1,134,207, of whom the aborigines numbered 7,705 and the Chinese 12,781. In 1893 a financial crisis resulted in the suspension of ten banks; but with two exceptions they were reconstructed, and by the following year the effects of the depression had passed away. In 1896 a conference of Australian premiers was held at Sydney to consider the question of federation. The then premier, G. H. Reid, was rather lukewarm, as he considered that the free-trade policy of New South Wales would be overridden by its protectionist neighbours. But his hand was to a great extent forced by a People's Federation convention held at Bathurst, and, ultimately, a considerable majority in favour of federation was obtained.

From 1899 On.—During the South African War (1899–1902) New South Wales sent 314 officers and 5,796 men, more than one-third of the total number raised by Australia. In spite of the great drought of 1902, the state made progress, and during the period 1901–14 the cultivated area was almost doubled. Scientific breeding of wheat and dry-farming were important factors in this increase.

The protectionist policy of the federal government helped the manufacturers, and the change from free trade did not appear to injure the prosperity of the country.

The influence of the Labour party was manifested in the adoption of laws extending the arbitration system, and from 1906 "assisted immigration" became its accepted policy. In 1912 fruit-growing began in the irrigation area of the Murrumbidgee. After 1918 a policy of closer settlement for ex-servicemen was initiated and further encouragement given to immigration from Great Britain.

The railway strike of 1917 had far-reaching effects: it raised legal and constitutional questions of importance and caused, ten years later, the downfall of the Labour ministry. In 1925, John T. Lang, the Labour premier, had instructed the railway commissioners to reduce in rank the men who had not taken part in the strike. The arbitration court forbade the commissioners to carry out the premier's instruction. Thereupon Lang introduced his Railway bill to annul the decision of the court. This was passed in the assembly but rejected by the legislative council. As the council is a nominated body, Mr. Lang recommended to the governor that 25 new members (all pledged to support the bill) should be added to its number. The recommendation was, after some demur, accepted, but, when a further bill was brought forward to abolish the council, some of the new councillors refused to die for the party and the bill was rejected by 47 to 41.

During the earlier part of this period there was a great deal of activity in railway circles. In 1926 the first section of the underground in Sydney was opened; and in 1932 the great bridge over the harbour, which had been started in 1925, was ready for traffic. In 1930 two important lines were opened; *i.e.*, in the far west to Broken Hill, which had previously been reached via Adelaide, and the Kyogle-Brisbane railway. By this route Brisbane was linked to Sydney and Albury by a complete standard-gauge railway in 1932, when the large bridge over the Clarence river was ready for use. In 1930 Kingsford Smith flew from England to Australia in less than 11 days, and in 1934 the airmail to England was inaugurated.

In 1933 there was a record wheat harvest, and the evils of the depression began to lessen. The decennial census was taken on June 30. In the same year the great Hume dam across the Murray river near Albury was completed. The year 1938 was the 150th anniversary of the foundation of Australia, and widespread celebrations took place, especially in Parramatta. In 1939 the Arbitration court adopted 44 hours as the standard working week. Baron Wakehurst became governor of the state in 1937, while in the state parliament A. Mair was premier in 1939, but gave place to Hon. William John McKell in 1941.

(H. D. N.; G. Tr)

NEWSPAPERS. A newspaper is an unbound serial publication issued at frequent intervals and devoted primarily to news. Most newspapers are issued daily or weekly. Some are published semiweekly, and there have been rare examples of fortnightly and monthly newspapers. The distinction between the newspaper and the magazine is sometimes a nice one, especially among weeklies; in general, the publication is called a magazine if it is bound within covers. Neither a page size nor a number of pages has ever been fixed for the newspaper, though before the advent of the cylinder press in the 1820s (*see* PRINTING), pages were necessarily accommodated to primitive presses which took sizes limited to 6 in. by 9 in. to 12 in. by 18 in.; after the 1820s until the advent of the tabloid, the large folio page was commonly considered the true newspaper form. In the 20th century the folio of about 16 in. by 23 in. and the "tabloid" of about half that size (or the folio folded once) became the common newspaper page sizes.

About 7,200 daily newspapers were published in the world at mid-20th century, one-fourth of them in the United States.

Early Examples.—As early as the 5th century B.C. there were writers of newsletters in Rome who furnished news to those who resided at a distance from the capital, and written news letters continued to be employed to supply intelligence to businessmen and political leaders until long after the invention of printing. Indeed, they have their modern counterparts in the "confidential newsletters" supplied to businessmen and others.

When Gaius Julius Caesar became Roman consul in 60 B.C. he immediately established the *Acta Diurna,* a daily bulletin posted in the forum and devoted chiefly to government announcements. Other forerunners of printed newspapers were the town criers (or bellmen), posted proclamations, controversial pamphlets, ballads, broadsides and news pamphlets. Many of the last-named appeared in Germany and other European countries in the 16th century and were sold at fairs and in shops; they usually dealt with a battle, a disaster, a marvel or a coronation.

In the first two decades of the 17th century, more or less regular papers printed from movable types sprang up in Germany, Austria, the Netherlands and Italy.

BRITISH NEWSPAPERS

Certain pamphlets may be taken as predecessors of the English newsbooks. *Newes concernynge the General Councell Holden at Trydent* (Thomas Raynalde, London, 1549), a translation from the German, was one of the earliest. They dealt with political matters, murders, wonders, etc., and were commonly published some time after the events they chronicled. They were not so much budgets of news as "relations" of a single event and matters connected with such an event. As a type of publication, they were modelled upon continental (especially German and Dutch) newsbooks, of which they were sometimes translations or adaptations. The German compilations of a half-year's events, called *Messrelationen* because they were sold at the fairs, clearly had an influence on later periodical development and were significant for England. Such a compilation in Latin by Micael ab Isselt, entitled *Mercurius Gallobelgicus,* continued 1594–1635, was widely popular in England, and brought the name *mercury* into use for newsbooks; some of the later issues were translated into English.

Doubtless under the influence of the *Messrelationen,* briefer compilations, many of which were translated or adapted for English readers, appeared from 1590 onward. When English editors took over the idea of the news budget in 1621, the publications were commonly called "corantos" to indicate current or running news.

The first English-language corantos were, however, small single-sheet (two-page) publications, and they were published in the Netherlands from Dec. 1620 to Sept. 1621. George Veseler published 15 of them and Broer Jonson 6 or 8 in Amsterdam; others were issued in Alkmaar and The Hague. Apparently the next step was the publication of the same type of coranto in London in Sept. 1621, under the title *Corante, or, Weekely Newes from Italy, Germany, Hungarie, Spaine and France.* Six of these were issued "for N. B." with slight variations in title through September and October. The title is nearly enough identical, and the weekly periodicity (though actually irregular) clear enough in intention, to support the claim for this series as the first English newspaper. "N. B." was probably Nicholas Bourne, though there is a possibility that it was Nathaniel Butter. The sheets were translations of Dutch or German corantos.

The next year the single-sheet corantos gave place to those in pamphlet form; and comparative regularity in periodicity, if not

in title, came with the *Weekly Newes,* issued by Nicholas Bourne and Thomas Archer beginning in May 1622. This series was generally referred to as composing the "first English newspaper" before the discovery in 1912 of the single-sheet corantos by "N. B." Continuity was by dates rather than identical title; for several years most coranto publishers depended upon changing headlines to sell their product and avoided identical titles. On Aug. 2, 1622, Nathaniel Butter began a *Newes,* "all of which do carry a like title . . . and have dependence upon one another" (Aug. 23). Butter, the son of a bookseller, became the most famous of the coranto publishers who flourished in the 1620s—a group including Bourne, Archer, William Sheffard, Bartholemew Downes and Nathanael Newbery. In Oct. 1622, with Bourne and Sheffard, Butter began *A Coranto,* with the introduction of serial numbering. In 1625 Archer founded *Mercurius Britannicus,* which probably lasted till the end of 1627. Butter and Bourne remained principal publishers of the corantos of various series until 1632, when all were suppressed because the Spanish ambassador had been offended by news they had published regarding the royal house of Austria. For six years thereafter there were no newsbooks in England, but in 1638 Butter and Bourne were given exclusive patent for publication of foreign news.

Freedom and Censorship.—The next step in the evolution of the newspaper was due to the abolition of the Star Chamber in 1641, and the consequent freeing of the press; and at last we come to the English periodical with domestic news. In Nov. 1641 began *The Head of severall proceedings in the present parliament* (outside title) or *Diurnal Occurrences* (inside title), the latter being the title under which it was soon known as a weekly; and on Jan. 31, 1642, appeared *A Perfect Diurnal of the Passages in Parliament.* These were printed for William Cooke, and were written apparently by Samuel Pecke, "the first of the patriarchs of English domestic journalism" (J. B. Williams). The weekly *Diurnals* were on the side of the parliament until in Jan. 1643 appeared at Oxford the first Royalist diurnal, named *Mercurius Aulicus, a Diurnal communicating the intelligence and affaires of the Court to the rest of the Kingdome* (continued till Sept. 1645, and soon succeeded by *Mercurius Academicus*), which struck a higher literary note. It was conducted by Sir John Berkenhead, a fellow of All Souls, whose style is said to reflect that of the parliamentary oratory of his day. He afterward became master of requests. *Mercurius Civicus,* the first regularly illustrated periodical in London, was started by the parliamentarian Richard Collings on May 11, 1643 (continued to Dec. 1646); Collings had also started earlier in the year the *Kingdome's Weekly Intelligencer,* which lasted till Oct. 1649. In Sept. 1643 appeared another Puritan opponent of *M. Aulicus* in the later *Mercurius Britannicus* of Capt. Thomas Audley, which in Sept. 1644 was taken over and continued for nearly two years by Marchamont (or Marchmont) Nedham. Nedham was a master of invective and one of the earliest to change sides when it suited him. From Oct. 1649 to June 1650, by a new act of parliament, the licensed press itself was entirely suppressed, and in 1649 two official journals were issued, *A Brief Relation* (up to Oct. 1650) and *Severall Proceedings in Parliament* (till Sept. 1655), a third licensed periodical, *A Perfect Diurnall* (till Sept. 1655), being added later in the year and a fourth, *Mercurius Politicus* (of which John Milton was the editor for a year or so and Nedham one of the principal writers), starting on June 13, 1650 (continuing till April 12, 1660). After the middle of 1650 there was a revival of some of the older licensed newsbooks; but the *Weekly Intelligence of the Commonwealth* (July 1650 to Sept. 1655), by R. Collings, was the only important newcomer up to Sept. 1655, when Oliver Cromwell suppressed all such publications with the exception of *Mercurius Politicus* and the *Publick Intelligencer* (Oct. 1655 to April 1660), both being official and conducted by Nedham.

Till Cromwell's death (Sept. 3, 1658) Nedham reigned alone in the press, but in 1659 a rival appeared in Henry Muddiman (a great writer also of "newsletters"), whose *Parliamentary Intelligencer,* renamed the *Kingdom's Intelligencer* (till Aug. 1663), was supported by Gen. George Monk. Nedham's journalistic career came finally to an end (he died in 1678) at the hand of Monk's council of state in April 1660. His successor, Muddiman, was supplanted in 1663 by Sir Roger L'Estrange, formerly a royalist cavalry officer who narrowly escaped execution during the commonwealth; he was appointed "surveyor of the press." On him was conferred by royal grant—as it proved, for only a short period—"all the sole privilege of writing, printing and publishing all narratives, advertisements, mercuries, intelligencers, diurnals and other books of public intelligence; . . . with power to search for and seize the unlicensed and treasonable schismatical and scandalous books and papers." L'Estrange discontinued *Mercurius Politicus* and *Kingdom's Intelligencer* and substituted two papers, the *Intelligencer* (Aug. 1) and the *Newes* (Sept. 3), at a halfpenny, the former on Mondays and the latter on Thursdays; they were continued till Jan. 29, 1666, but from the beginning of 1664 the *Intelligencer* was made consecutive with the *Newes,* numbered and paged as one.

The London Gazette.—The first number of the biweekly *Oxford Gazette,* licensed by Lord Arlington and written by Muddiman, was published on Nov. 16, 1665. It was a "paper" of news, measuring $5\frac{1}{2}$ in. by $9\frac{1}{2}$ in., and printed on both sides. With the publication of the 24th number (Monday, Feb. 5, 1666, O.S.) the *Oxford Gazette* became the *London Gazette,* which has appeared twice a week, on Tuesdays and Fridays, ever since as the official organ of government. After the Revolution of 1688 the press censorship was relaxed, being finally abandoned in 1693, and a number of newspapers came into being, including the *Universal Intelligence, English Courant, London Courant, London Mercury, London Intelligence, Orange Gazette, Flying Post, Post-Boy,* a daily which lasted only four days, and the *Lincoln, Rutland, and Stamford Mercury,* the oldest of the provincial papers, having been founded in 1695. In 1699 appeared the *Edinburgh Gazette,* a biweekly.

Elizabeth Mallet published the first English daily newspaper March 11, 1702. She abandoned it after a week or two, but it was resumed a month later by Samuel Buckley. It measured $6\frac{1}{4}$ in. by $11\frac{1}{2}$ in., printed on one side only, and strove to adhere to factual news rather than opinion.

Defoe and Lloyd.—Daniel Defoe was the first English journalistic writer of national importance. In Feb. 1704 he began his weekly, the *Review,* which eventually was printed three times a week and was a forerunner of the *Tatler* (started by Sir Richard Steele in 1709) and the *Spectator* (started by Steele and Joseph Addison in 1711). Defoe's *Review* came to an end in 1713, and between 1716 and 1720 he published a monthly with an old title, *Mercurius Politicus.* By some authorities Defoe is considered the originator of the serial story.

The *Examiner,* which was started in 1710 as the chief Tory organ, enjoyed as its most influential contributor Jonathan Swift, the father of the leading article. Edited by William King, afterward principal of St. Mary's hall, Oxford, this political journal had brilliant contributors in Henry St. John, Viscount Bolingbroke; Matthew Prior; Francis Atterbury; and John Arbuthnot. Swift had control of the journal for 33 numbers between Nov. 1710 and June 1711, but on becoming dean of St. Patrick's he gave up regular journalistic work. There followed a number of other political journals, such as the *Craftsman,* the *Whig Examiner* and the *Medley.*

In 1696 Edward Lloyd—the virtual founder of the famous "Lloyd's" of commerce—started a thrice-a-week paper, *Lloyd's News,* which had but a brief existence in its first shape, but was the precursor of the modern *Lloyd's List.* No. 76 of the original paper contained a paragraph referring to the house of lords, for the appearance of which a public apology must, the publisher was told, be made. He preferred to discontinue his publication (Feb. 1697). Nearly 30 years afterward he in part revived it, under the title of *Lloyd's List*—published at first weekly, afterwards twice a week (*see* F. Martin, *History of Lloyds,* 66–77 and 107–120). This dates from 1726. It later became a daily, published in several forms for diverse commercial interests.

Stamp Tax of 1712.—The increasing popularity and influence

of the newspaper press could not fail to be distasteful to the government of the day. The paper which seems to contain the first germ of the newspaper tax is still preserved among the treasury papers, and probably belongs to the year 1711. "There are published weekly," says the writer, "about 44,000 newspapers, viz., *Daily Courant, London Post, English Post, London Gazette, Postman, Postboy, Flying Post, Review* and *Observator*." ("A Proposition to Increase the Revenue of the Stamp-Office," Redington, *Calendar of Treasury Papers, 1708–1714*, p. 235.) The duty eventually imposed (1712) was a halfpenny on papers of half a sheet or less, and a penny on such as ranged from half a sheet to a single sheet.

Swift's doubt expressed in his *Journal to Stella* (Aug. 7, 1712) as to the ability of the *Spectator* to hold out against the tax was justified by its discontinuance in Dec. 1712, Steele starting the *Guardian* in 1713, which only ran for six months. But some of the worst journals that were already in existence kept their ground, and their number soon increased. An enumeration of the London papers of 1714 comprises the *Daily Courant*, the *Examiner*, the *British Merchant*, the *Lover*, the *Patriot*, the *Monitor*, the *Flying Post*, the *Postboy, Mercator*, the *Weekly Pacquet* and *Dunton's Ghost*. Another enumeration in 1733 includes the *Daily Courant*, the *Craftsman, Fog's Journal, Mist's Journal*, the *London Journal*, the *Free Briton*, the *Grub Street Journal*, the *Weekly Register*, the *Universal Spectator*, the *Auditor*, the *Weekly Miscellany*, the *London Crier, Read's Journal, Oedipus or the Postman Remounted*, the *St. James's Post*, the *London Evening Post* and the *London Daily Post*, which afterward became better known as the *Public Advertiser*. Part of this increase may fairly be ascribed to political corruption. Later toward the middle of the same century the provisions and the penalties of the Stamp act were made more stringent. Yet the number of newspapers continued to rise. In 1753 the aggregate number of copies of newspapers annually sold in England, on an average of three years, amounted to 7,411,757. In 1760 it had risen to 9,464,790, and in 1767 to 11,300,980. In 1776 the number of newspapers published in London alone had increased to 53.

18th-Century Journalists.—Thus the 18th century saw the gradual development of the purely political journal side by side with those papers which were primarily devoted to news, domestic and foreign, and commerce. It was left to Steele and Addison to develop the social side of journalism in their journals named above which found a permanent place in English literature. Nor must we omit Samuel Johnson's second biweekly, the *Rambler*, started in 1750, and his weekly, the *Idler* (1758). In 1761 the *North Briton* came out and it was largely a result of John Wilkes's determined fight for the liberty of the press that at length the last shackles on free expression of opinion in Britain were cut away, and by 1772 the right to publish parliamentary reports had been established.

The outstanding daily paper in the middle of the 18th century was the *Public Advertiser*, which for about 25 years had been called the *General Advertiser* (and for some time the *London Daily Post*). It was published with notable success by Henry Woodfall and his son Henry Sampson Woodfall, and it was in this paper that appeared the famous letters of Junius (*q.v.*), which have been attributed to Sir Phillip Francis. These papers led to a marked increase in its circulation, the monthly sale in Dec. 1771 being almost 84,000 as compared with 47,500 seven years previously. But in 1798 it was merged in the *Public Ledger*.

Early 19th Century.—In 1769 William Woodfall started the *Morning Chronicle*, whose daily circulation in 1819 reached 4,000, and in 1843, at a time when Charles Dickens was a contributor, 6,000. But in another six years the circulation had fallen to 3,000. For about five years it became the property of the duke of Newcastle, Gladstone and others, but finally ended insolvent, after a life of more than 90 years. Another long-lived daily paper, whose top circulation was about 6,000, was the *Morning Herald* (1781–1869). Two other important and long-lived dailies were started in the 18th century, the *Morning Post* and the *Times*; these are dealt with later, together with the *Morning Advertiser*, founded in 1794. It was William Cobbett who first attempted to reach the masses by his pen, and reduced the price of his *Weekly Political Register* from 1*s*. ½*d*. to twopence in his endeavour to appeal to the working classes for support of those principles of parliamentary reform dear to his heart. In 1808 Leigh Hunt brought out the *Examiner*, whose frank criticism of the prince regent landed him and a brother in prison. This weekly journal had quite a long lease of life and excelled in dramatic criticism, besides giving an excellent review of the events of the week in all branches of public affairs.

Abolition of "Taxes on Knowledge."—The development of the press was enormously assisted by the gradual abolition of the "taxes on knowledge," and also by the introduction of a cheap postal system. In 1756 an additional halfpenny was added to the tax of 1712. In 1765 and in 1773 various restrictive regulations were imposed. In 1789 the three halfpence was increased to twopence, in 1798 to twopence-halfpenny, in 1804 to threepence-halfpenny and in 1815 to fourpence, less a discount of 20%. As prosecutions multiplied, and the penalties became more serious, revolutionary tendencies increased in a still greater ratio. Blasphemy was added to sedition. Penny and halfpenny journals were established which dealt exclusively with narratives of gross vice and crime. Between 1831 and 1835 hundreds of unstamped newspapers made their appearance. The political tone of most of them was fiercely revolutionary. Prosecution followed prosecution, but all failed to suppress the obnoxious publications.

To Lord Lytton, the novelist and politician, and subsequently to Milner Gibson and Richard Cobden, is chiefly due the credit of grappling with this question in the house of commons in a manner which secured first the reduction of the tax to a penny in 1836, and then its total abolition in 1855. The number of newspapers established from the early part of 1855, when the repeal of the duty had become a certainty, and continuing in existence at the beginning of 1857, amounted to 107; 26 were metropolitan and 81 provincial. The duties on paper itself were finally abolished in 1861.

The abolition of the stamp taxes brought about such reductions in the prices of newspapers that they speedily began to reach the many instead of the few. Some idea of the extent of the tax on knowledge imposed in the early 19th century may be gathered from the fact that the number of stamps issued in 1820 was nearly 29,400,000, and the incidence of the advertisement tax, fixed at 3*s*. 6*d*. in 1804, made it impossible for the newspaper owner to pass on the stamp tax to the advertiser. In 1828 the proprietors of the *Times* had to pay the state more than £68,000 in stamp and advertisement taxes and paper duty. But after the reduction of the stamp tax in 1836 from fourpence to one penny, the circulation of English newspapers, based on the stamp returns, rose from 39,000,000 to 122,000,000 in 1854.

It is appropriate at this stage to sketch the history of the great English newspapers.

THE LONDON PRESS

The Times, occupying the premier position among British newspapers, was started by John Walter on Jan. 1, 1785, under the name of the *Daily Universal Register*. The founder promised the readers of the new journal that it would contain nothing to wound anyone's delicacy or corrupt the mind, that it would abstain from unfair partisanship and scandalous scurrility. On Jan. 1, 1788, its title was changed to the *Times*, and this great newspaper has ever since been the pre-eminent national journal and daily historical record. It came into existence when free expression of opinion in the press was still a thing of the future, and within a few years of the establishment of his paper Walter had several sojourns in Newgate and had to pay several fines for criticisms of the authorities. One of his offenses was the statement that the then prince of Wales and other royal princes had by their misconduct incurred the just disapprobation of George III.

John Walter II practically took over the reins in 1803, and he also had to encounter the active opposition of governments which he had occasion to criticize, including that of William Pitt. He introduced a better system of news transmission and steam printing (1814) with the result that he was able to make the proud

announcement that 1,100 sheets had been impressed in one hour. In view of the newspaper and advertisement tax and other disabilities, it was a considerable achievement when in 1815, the year of Waterloo, the daily circulation reached 5,000. In 20 years this was doubled, in 1851 it had reached 40,000 and three years later it was more than 50,000, when its most circulated rival, the *Morning Advertiser,* had a sale of fewer than 8,000 copies. When John Walter II assumed control the *Times* was a small four-page sheet. When he gave up control in 1847 it consisted of 12 large pages. Sir John Stoddart, later governor of Malta, was the editor for several years up to 1816. He was succeeded by Thomas Barnes, and when the latter's health began to fail much of the editorial work devolved upon Capt. Edward Sterling, whose pontifical and sometimes explosive style caused Thomas Carlyle to say: "He more than any other man was *The Times,* and thundered through it to the shaking of the spheres." Carlyle also called him "Captain Whirlwind," and the popular title of the "Thunderer" often given to the *Times* dated from his time. In those days the most powerful writer in its columns on foreign affairs was Crabb Robinson; his place was taken at a later date by Henry Reeve.

In 1841 on the death of Barnes the editorial chair was taken by a young man, John Thaddeus Delane, whose brilliant career in this capacity lasted until 1877. His place was taken by Thomas Chenery, who died in 1884 and was succeeded by George Earle Buckle. Meanwhile, since 1848 John Walter III had been in command. He died in 1894, and was succeeded by Arthur Walter.

About the beginning of the 20th century the *Times* had begun to feel the influence of the more go-ahead methods of the popular press, and there was a loss of circulation and revenue which became a grave source of anxiety to its owners. It was a period when another great London daily paper, the *Standard,* was *in extremis.* Finally, in 1908 Lord Northcliffe realized his ambition of long years and acquired the chief control of the "Thunderer." It cannot be said that Lord Northcliffe's administration was consistently successful but he thoroughly remodelled the organization and increased its efficiency in all departments.. On his retirement Buckle was succeeded as editor by George Geoffrey Dawson. In 1919 he retired from the editorship because of a difference of opinion with Lord Northcliffe and his place was taken by Henry Wickham Steed. In 1923 when, following the death of Lord Northcliffe, Major J. J. Astor, M.P., became its chairman and chief proprietor, Dawson again became editor. Major Astor secured the future independence of the paper by a deed establishing a body of trustees consisting of holders of various public offices whose consent would be required to validate any future transfer of ownership.

In 1941 Dawson retired from the editorship of the *Times* in favour of Robert M. Barrington Ward, who upon his death seven years later was succeeded by W. F. Casey. At the midcentury the *Times,* though it had fallen far behind most of its London competitors in circulation (240,000), still enjoyed a prestige and leadership in opinion which made it a national institution. Usually reflecting government views, it had a well-earned reputation for independence.

The *Times* excelled in many departments, mainly by employing experts in particular subjects. It specializes in its presentation of foreign affairs and early set up an able staff of correspondents in the chief capitals of the world. One of the most famous of these was Henri de Blowitz, who among his many "scoops" secured for the *Times* the privilege of publishing exclusively the text of the Berlin treaty of 1878 on the very day that it was signed.

The principal adjuncts to the *Times* are the literary supplement, which surveys the whole field of new literature every Thursday; the weekly edition, first published in 1877, containing a summary of the week's news; the *Times* law reports; the educational supplement and the trade and engineering supplement, which are weekly publications; and the index, an invaluable record of the events of the day recorded in the newspaper, which is published quarterly. In addition, the *Times* issues at intervals handsome supplements to its readers without any extra charge.

The Daily Telegraph & Morning Post, another great national daily, was first published as the *Daily Telegraph and Courier,* on June 29, 1855, a twopenny newspaper. It was owned by Colonel Arthur B. Sleigh, who transferred it to Joseph Moses Levy in the following September. Levy produced it as the first penny newspaper in London, the name *Courier* being subsequently dropped. His son Edward Lawson (later the first Baron Burnham) soon became editor, which post he continued to hold till 1885. A long list of distinguished members of the staff included Sir Edwin Arnold, George Augustus Sala, Edward Dicey, Sir J. M. Le Sage, Bennet Burleigh, the war correspondent, J. L. Garvin and H. D. Traill; and among dramatic and literary critics Clement Scott and W. L. Courtney. After 1890 the Hon. Harry Lawson, eldest son of the owner (later Viscount Burnham), assisted in the general control. The *Daily Telegraph* became the especial organ of the middle classes and shortly before the advent of the halfpenny daily newspaper had achieved so remarkable a success that it could claim the largest circulation in the world. It was consistently Liberal up to 1878 when it opposed Gladstone's foreign policy, and at the Irish Home Rule split in 1886 it became Unionist. Its enterprises included the financing of an important archaeological exploration in Nineveh resulting in the discovery of a number of fragments of the cuneiform narrative of the deluge, and the dispatch, in co-operation with the *New York Herald,* of Sir H. M. Stanley on his successful exploration of Africa.

Circulation by 1927, however, had declined to 84,000; and in 1928 Viscount Burnham sold the paper to the brothers Sir William Ewert Berry and Sir James Gomer Berry (later Viscount Camrose and Viscount Kemsley) and Sir Edward (later Lord) Iliffe. Circulation increased, doubling in 1930, when the price was reduced to a penny. The *Morning Post* was absorbed in 1937, and the *Daily Telegraph & Morning Post* was at mid-century a quality morning newspaper, well-balanced and independent Conservative in politics, with more than 900,000 circulation.

The *Morning Post* had been founded in 1772 as the *Morning Post and Daily Advertising Pamphlet,* mostly an advertising sheet including state lotteries, which were legal and popular at that time. It developed into a national newspaper under the ownership of Peter and Daniel Stuart after 1795, and attracted a wonderful galaxy of writers, including Sir James Mackintosh, Samuel Taylor Coleridge, Robert Southey, Arthur Young, the poet Thomas Moore, William Wordsworth and Charles Lamb. The *Morning Post* maintained a tradition of vigorous and unblenching criticism, and Nicholas Byrne, editor-owner who succeeded Daniel Stuart, was murdered in his office as the result of an article which had given offense. In 1850 the paper came under the control of Peter Borthwick, and on his death in 1852 he was succeeded by his son, Algernon (later Lord Glenesk). Among the editors of the *Morning Post* were Sir William Hardman, J. Nicol Dunn, Sir Fabian Ware, and H. A. Gwynne. In 1937 the paper, as noted above, was consolidated with the *Daily Telegraph.*

The News Chronicle resulted from the amalgamation of several papers, notably the *Daily News* and the *Daily Chronicle,* both of which will be discussed here separately.

The *Daily News* was founded in 1846 under the editorship of Charles Dickens, who soon retired and was succeeded for a year or so by John Forster, later his biographer. The original staff included Mark Lemon, afterward editor of *Punch,* and Douglas Jerrold. The *Daily News* acquired a consistent record as a champion of Liberalism; it led British public opinion in sympathizing with the north in the United States Civil War, in supporting the war of freedom in Italy and the emancipation of Bulgaria and the Armenians. Under the control of Sir John Robinson it attained a high reputation for its foreign correspondence, beginning with the celebrated Archibald Forbes in the Franco-German War of 1870–71.

The *Daily News* absorbed the *Morning Leader* and acquired the *Star* in 1909, absorbed the *Westminster Gazette* in 1928 and was amalgamated with the *Daily Chronicle* in 1930.

The *Daily Chronicle,* unlike the *Daily News,* which was started under distinguished auspices, was the outgrowth of a London

local daily, the *Clerkenwell News,* and was established in 1877. It consisted almost entirely of small advertisements and Edward Lloyd, the founder of *Lloyd's News,* turned it into a general morning London newspaper. During the Home Rule controversies of the '80s it was Liberal Unionist, but under the editorship of A. E. Fletcher (1895) it became Gladstonian Liberal. Fletcher was succeeded by Henry W. Massingham, who, while maintaining the literary features, made the paper a more robust political organ. Massingham was a Radical; he lost his position on the *Chronicle* because of his opposition to the Boer War. He was succeeded by W. J. Fisher and the paper pursued a humdrum career and was a declining property when in 1904 Robert Donald was appointed editor. The paper entered upon a new era of prosperity and prestige which reached its height during World War I.

The paper was sold to David Lloyd George and his friends in the autumn of 1918, when Sir Robert Donald retired from his position as editor. After several other changes in ownership and management, the *Daily Chronicle* was amalgamated with the *Daily News* in 1930 to form the *News Chronicle.* At mid-century it had a circulation of more than 1,500,000, with simultaneous publication in London and Manchester. An independent progressive paper, it emphasized features and sports.

The Daily Mail, started by Alfred and Harold Harmsworth in 1896 as a halfpenny daily newspaper, was a phenomenal success from the first number. By 1900 it had already reached the 1,000,000 mark in circulation and by 1929 it had 2,000,000. In 1905 Sir Alfred Harmsworth started in Paris the *Continental Daily Mail,* later the property of Lord Rothermere. The *Daily Mail* also established editions in Manchester, Eng., and Edinburgh, Scot.

Sir Alfred (later Viscount Northcliffe) was not only a brilliant organizer but a keen journalist; he pioneered in many enterprises of journalism and national interests, including invaluable help to aviation.

On the death of Lord Northcliffe in 1922, the paper came under the control of his brother, Lord Rothermere. Thomas Marlowe, who had long been editor, resigned in 1926, and was followed by a series of talented journalists. On the retirement of the owner in 1937 the management passed to his son, the second Lord Rothermere. In the late 1920s and early 1930s the *Daily Mail* had the largest daily circulation in the world. By mid-century it had a distribution of somewhat more than 2,000,000, but at that time it had been greatly exceeded in circulation by both the *Daily Express* and the *Daily Mirror.*

The Daily Express, which was founded as a halfpenny newspaper in 1900 by C. Arthur Pearson, passed the *Daily Mail* in circulation in the 1930s through the use of free-gift inducements. Following the lead of U.S. newspapers, the *Daily Express* struck a new note, later imitated by other London papers, of publishing its principal news on the front page, which became, so to speak, the shopwindow. In 1904 R. D. Blumenfeld became editor and in 1912 he formed a syndicate which acquired control. Lord Beaverbrook began to take an interest in the paper while it was financially in low water, and in 1922 he obtained complete control. He spent prodigious sums in developing the paper, which by mid-century had about 4,000,000 circulation and was being printed simultaneously in London and Manchester, Eng., and Glasgow, Scot.

The Daily Herald.—Founded in 1912 as a Labour organ, the *Daily Herald* was not taken over officially by the Labour party until 1923. In 1929 Lord Southwood, head of Odhams Press Ltd., large printing and publishing concern, arranged to take a 51% interest, while the party retained 49%. It was agreed that the paper should support the policy of the Trades Union congress. With the aid of free insurance and other inducements, the *Daily Herald* gradually built up a large circulation; in 1939 it made the claim, continued through mid-century, of daily sales in excess of 2,000,000.

The Daily Graphic.—The *Daily Sketch,* founded in 1909 as a halfpenny illustrated tabloid, absorbed the older and higher-priced *Daily Graphic* in the 1920s and was called for some years *The Daily Sketch and Graphic.* Coming into the hands of Lord Rothermere, it was later sold by him to Lord Kemsley. The name of the *Graphic* was then dropped, but in 1946 the *Daily Sketch* became *Daily Graphic.* At mid-century it had a circulation of about 775,000.

The Daily Mirror.—The *Daily Mirror* was originally issued in 1903 by Alfred Harmsworth, later Lord Northcliffe, as a women's paper to be edited by women. When it did not succeed in this field, its owner soon made it over into the first halfpenny illustrated tabloid. It retained a family flavour, however, with attention to women's interests. At mid-century it was second only to the *Daily Express* in circulation, selling 3,700,000 copies daily.

The Daily Worker.—Founded in 1932 as a Communist organ, the *Daily Worker* was suppressed in Jan. 1941 for opposing the national war effort and did not appear again until Sept. 1942 when the U.S.S.R. had joined the war against Germany. Its circulation at mid-century was somewhat more than 100,000.

London Evening Papers.—The above newspapers, all published in the morning, were selling for one penny at mid-century, except for the *Times* and the *Daily Telegraph & Morning Post* (threepence and one and one-half pence, respectively). One penny was also the price of the three afternoon papers, the *Evening Standard, Evening News* and *Star.*

The *Evening Standard* was begun in the 1870s as the afternoon edition of the *Standard* (*see* below) and was devoted largely to commercial news. In 1923 it became the property of Lord Beaverbrook, and later it absorbed the famous old *Pall Mall Gazette* (*see* below). Often called a "quality" evening newspaper, it had a circulation of nearly 800,000 at mid-century.

The *Evening News* was founded in 1881, and after many vicissitudes of fortune when in low water was acquired in 1895 by Alfred and Harold Harmsworth and Kennedy Jones. It was the Harmsworths' first incursion into daily journalism, and made a rich experimental field for the *Daily Mail.* One of the Associated Newspaper group, it had the largest circulation of any of the evening papers in the country at mid-century—approximately 1,750,000.

The *Star,* the only Liberal evening paper in London, was started by T. P. O'Connor in 1888 as a halfpenny journal in support of Gladstone. In 1909 it was acquired by the *Daily News* and had a circulation of more than 1,000,000 in the 1940s.

Great Papers of the Past.—Fleet street is crowded with the ghosts of journals which in their time have filled important places in the life of the country. There was the *Morning Chronicle,* which began its career in 1769 and had among its leading contributors Richard Brinsley Sheridan, Sir J. Mackintosh, John Campbell (afterward lord chancellor), Campbell, the poet, Thomas Moore, Lord Brougham, Byron, William Hazlitt, John Stuart Mill, Charles Lamb and William Makepeace Thackeray. John Black was its most famous editor. After a notable career the *Morning Chronicle* died in 1862.

The *Standard* was established as an evening paper in the Tory interest in 1827, its first editor being Stanley Lees Giffard. In the 1850s it was purchased by James Johnstone, who brought out the *Standard* as a morning paper (June 29, 1857) and increased its size from four to eight pages. One of its contributors in the 1860s was Lord Robert Cecil, later Lord Salisbury, the prime minister. Johnstone, to whose energy and perspicacity the paper owed so much, died in 1878, and under his will William H. Mudford was appointed editor and manager for life, or until resignation. Already a great property, the *Standard* in Mudford's hands entered upon a successful period. It had many famous war correspondents, foremost among whom were G. A. Henty, the famous author of boys' books; John A. Cameron, who was killed at Abu Klea, A.-E. Sud.; and William Maxwell. In Jan. 1900 Mudford retired, and was succeeded in the editorship by G. Byron Curtis (d. 1907). In Nov. 1904 the *Standard* was sold to (Sir) Cyril Arthur Pearson. In 1910 it passed into the control of Davison Dalziel (later Lord Dalziel) and disappeared during World War I.

A disastrous experiment in newspaper production was the *Tribune,* founded by Franklin Thomasson in 1906 as a solid penny

daily. After gathering a brilliant staff and expending very large sums he found it necessary to discontinue the paper in 1908. The unhappy enterprise was described in Sir Philip Gibbs's novel *The Street of Adventure.* The *Echo* was established by Cassell, Petter, Galpin and company in 1868 and afterward owned in turn by Albert Grant, the company promoter, Passmore Edwards, Andrew Carnegie and Sam Storey. The *Echo* perished in 1905.

The *Globe* was founded in 1803, and after many years as a leading Whig organ it turned Conservative in 1866 when it became the property of a syndicate which included Sir Stafford Northcote (Lord Iddesleigh). Two years later it assumed the deep pink hue which it kept until its demise after World War I. The first number of the *Pall Mall Gazette* (the name being borrowed from the incident in which Thackeray describes Captain Shandon in the Marshalsea prison drafting the prospectus of the *Pall Mall Gazette* as a paper "written by gentlemen for gentlemen") appeared in Feb. 1865. Its first editor was Frederick Greenwood, who gathered round him a brilliant array of talent in Sir Henry Maine, Sir J. Fitzjames Stephen, Anthony Trollope, Charles Reade, George Henry Lewes, George Eliot, Matthew Arnold and Richard Jefferies. In 1875 Greenwood was able to convey to Disraeli news of the French bid to secure control of the Suez canal, thereby enabling Britain to get in first. It had been a consistent supporter of Disraeli, and when on changing hands it became Liberal, John Morley (later Viscount Morley of Blackburn) became editor, with William T. Stead as assistant editor. When Morley exchanged journalism for politics in 1883, he was succeeded by Stead. Stead's adventurous career as the editor came to an end in 1889, in consequence of his publishing a series of articles called "The Maiden Tribute of Modern Babylon," purporting to further the Criminal Law Amendment bill. He was succeeded by E. T. Cook. The *Pall Mall Gazette* was now steadily Liberal and a strong advocate of Irish Home Rule. It had two distinguished editors at a later date in Sir Douglas Straight and J. L. Garvin, and finally passed through several hands before its consolidation with the *Evening Standard* in 1925.

Founded in 1880 by H. Hucks Gibbs (afterward Lord Aldenham) for Frederick Greenwood to edit when he had left the *Pall Mall Gazette,* the *St. James's Gazette* represented the more intellectual and literary side of Tory journalism in opposition to the new Liberalism of Greenwood's former organ. In 1888, the paper having been sold, Greenwood retired and was succeeded as editor (1888–97) by (Sir) Sidney Low, who in his turn was succeeded by Hugh Chisholm (1897–99). Among the contributors were Rudyard Kipling, Sir James Barrie and G. S. Street.

Toward the end of the 19th century it assumed a more popular style and shape, and for a year or two before its acquisition by Pearson in 1903 and its final merging in the *Evening Standard* it was edited by Ronald M'Neill (later Baron Cushendun).

When the *Pall Mall Gazette* was sold to Lord Astor in 1892 and converted into a Conservative organ, E. T. Cook, the editor, and most of his staff resigned; in 1893 they came together again on the *Westminster Gazette,* newly started for the purpose by Sir G. Newnes as a penny Liberal evening paper. It was printed on green paper. The paper was conducted on the lines of the old *Pall Mall Gazette,* and it had the advantage of a brilliant political cartoonist in F. Carruthers Gould. In 1896 Cook was appointed editor of the *Daily News,* and his place was ably filled by J. Alfred Spender. The *Westminster* became conspicuous for its high standard of political and literary criticism, and gradually became the chief organ of Liberal thought in London. In 1908 the paper was sold to a group of Liberal capitalists. It vanished after World War I to be replaced by a daily newspaper of the same name which was merged in the *Daily News* in 1928.

BRITISH PROVINCIAL PRESS

The first provincial paper in England was the weekly *Worcester Postman,* 1690, later the modern *Berrow's Worcester Journal.* In the first 20 years of the 18th century a number of other journals sprang up in country towns, practically all of them being weekly journals. Among them were the *Stamford Mercury* begun in 1713 and the *Northampton Mercury* begun in 1720. At the beginning of the 19th century the provincial press consisted of fewer than 100 journals, practically without influence. Benjamin Flower, printer of the *Cambridge Intelligencer,* was the first to introduce the leading article in the provincial press. The *Leeds Mercury,* founded in 1717, under the control of Edward Baines (1801) became the most important and influential of the north country papers in the first half of the 19th century. After the Reform Act of 1830 and the contemporaneous spread of self-education and establishment of reading circles and newspaper clubs, the country newspapers developed in importance and usefulness, being forced to assuage the public thirst for information and instruction. It was not, however, till the final removal of the taxes on knowledge, already described, that the provincial press came into its own.

Within ten years of the abolition of the paper duty, penny morning newspapers had taken up commanding positions in Edinburgh, Glasgow, Dundee and Aberdeen; in Liverpool, Manchester, Leeds, Bradford, Newcastle and Sheffield; in Birmingham and Nottingham; in Bristol, Cardiff and Plymouth; and across St. George's channel in Dublin, Cork, Belfast and Waterford. But any real importance as organs of opinion was still confined to only a few of the great penny provincial dailies, notably the *Yorkshire Post, Manchester Guardian, Birmingham Post* (1857), *Sheffield Telegraph* (associated with Sir W. Leng), *Liverpool Daily Post, Leeds Mercury* and *Western Morning News;* others too numerous to mention here were at the same time cradling journalists who were to become famous in a larger sphere, such as the *Darlington Northern Echo,* on which W. T. Stead made his debut, while Joseph Cowen for some years made the Newcastle *Daily Chronicle* a powerful force.

The first syndicate to send out war correspondents was formed by the *Glasgow News, Liverpool Daily Post, Manchester Courier, Birmingham Gazette* and *Western Morning News,* which dispatched two correspondents to Egypt. The Central News also sent out war correspondents to Egypt and the Sudan. During the South African War (1899–1902) the leading provincial newspapers, however, all formed syndicates to secure war telegrams.

At mid-20th century the leading English provincial daily papers were:

The *Manchester Guardian* was founded in 1821 as a weekly Whig organ and later became the chief exponent of Liberalism outside London. During the greater part of this period it was edited by C. P. Scott, and maintained a standard of excellence in all its branches that gave it a world-wide reputation. Apart from its vigorous politics it enjoyed an unrivalled literary prestige, and a dignity of expression and presentation. It became a penny paper in 1857, two years after it had been turned into a daily journal. Prominent names associated with it were C. E. Montague, C. P. Scott's son-in-law; Leonard T. Hobhouse; Andrew Lang; Richard Jefferies; Richard Whiteing; Sir Claude Phillips; George Saintsbury; Laurence Housman; G. W. E. Russell; and Spenser Wilkinson. In its book reviewing, its dramatic criticism and its foreign correspondence alone the *Manchester Guardian* exercised an unparalleled influence in provincial journalism, and came to be regarded as a national organ.

The *Manchester Evening News,* founded 1868, came under the same ownership as the *Guardian* in 1924. Its prosperity (circulation more than 300,000 at mid-century) became valuable to the *Guardian.*

The *Yorkshire Post* began in 1754 and became the principal Conservative newspaper outside London, enjoying national prestige extending far beyond the borders of Yorkshire. In its early years it devoted especial attention to racing, which was neglected by most local papers in the country in those days, and under the control of the Beckett family it rapidly attained a solid prosperity. It had talented editors in H. J. Palmer, J. S. R. Phillips, Arthur H. Mann and W. L. Andrews.

The *Yorkshire Evening Post,* founded 1890, became the popular evening paper for all Yorkshire, with a circulation of 250,000.

The *Birmingham Daily Post* was founded in 1857 by J. F. Feeney and John Jaffray (afterward made a baronet) and later was controlled by Sir Charles Hyde. It came to hold a position in the midlands analogous to that of the *Yorkshire Post* in the

north. It was purchased by Lord Iliffe after Hyde's death in 1942. Its evening associate, the *Mail,* had a circulation of nearly 300,000 at mid-century.

The *Liverpool Daily Post* was founded in 1855 as a Liberal paper, and for many years possessed as its editor Sir Edward Russell. In 1904 it absorbed the *Liverpool Mercury* (founded in 1811), and it assumed a pre-eminent place in the life of the great seaport. As with the other morning papers mentioned above, it was far exceeded in circulation by its afternoon associate—in this case, the *Evening Echo,* with a list of more than 380,000.

Other top-circulation provincial papers were the *Manchester Daily Dispatch,* morning, Conservative, a Kemsley paper, with more than 500,000 circulation; and the *Evening Chronicle* of Newcastle-on-Tyne, Conservative, founded 1885, with a list of 260,000.

Scotland, Wales and Ireland.—In Scotland the leading newspapers in 1950 were still the *Scotsman* and the *Glasgow Herald.* The former was started as a biweekly in 1817 and became a daily in 1855. It was Liberal until the Home Rule split in 1886 when it adopted the Unionist cause. Alexander Russel was its most famous editor in the 19th century (1848–76) and for many years it has been the only Edinburgh morning newspaper.

The *Glasgow Herald* dates from 1783, when it first came out with the extra name "*and Advertiser*" tacked on. It acquired a great literary reputation under an illustrious line of editors, including Samuel Hunter, George Outram, Sir Robert Bruce and Sir William Robieson.

The largest circulations in Scotland in 1950 were those of the *Glasgow Daily Record,* founded 1895, a Conservative morning paper under Kemsley ownership, 385,000; and the *Glasgow Evening Times,* founded 1876, nearly 300,000.

In Wales, the four Cardiff papers in 1929 were amalgamated into two, the *South Wales Echo and Evening Express* and the *Western Mail and South Wales News,* both Kemsley newspapers; at mid-century the former had the largest of Welsh circulations—about 170,000. In 1929 also the two Swansea papers were consolidated by Lord Northcliffe as the *South Wales Evening Post.*

Belfast, Northern Ireland, had four morning papers and one evening in 1950. The mornings were the *News-Letter* (1737), the *Northern Whig* (1824), the *Irish News* (1855) and the *Irish Daily Telegraph* (1904); the youngest had the largest circulation—about 120,000. The afternoon paper was the *Belfast Telegraph* (1870). In Ireland there were three morning and two evening papers published at Dublin and one of each at Cork. Of these, the oldest and largest were the *Dublin Evening Mail* (1823) and the *Cork Examiner* (1840, morning).

BRITISH ILLUSTRATED NEWSPAPERS

English papers carried news pictures as early as 1731, when the *Grub Street Journal* printed a woodcut depicting the lord mayor's show, but not until 1842 did England have a fully illustrated newspaper.

Herbert Ingram conceived the idea of "all the news in pictures" and he brought out the first number of the *Illustrated London News* on May 14, 1842, price sixpence, a weekly paper containing 16 printed pages and 32 woodcuts, one of which depicted the great fire at Hamburg in which 100 people lost their lives. The chief engravings, by Sir John Gilbert, illustrated the first *bal masqué* given by Queen Victoria at Buckingham palace. From that time onward the *Illustrated London News* continued to give a faithful representation of the events of the week. In 1860 Ingram was drowned in the disaster in Lake Michigan in the U.S. which overtook the steamer "Lady Elgin." Control of the paper passed to his son, afterward Sir William Ingram. Its editors included Charles Mackay (1848–59), John Lash Latey (1859–90) and Clement K. Shorter (1890–99). The *Illustrated London News* held the field alone in weekly illustrated journalism until in 1861 the first penny popular paper was started by the same proprietor, the *Penny Illustrated Paper,* edited by John Latey, Jr., who afterward for a period was editor of the *Illustrated London News.* In 1869 the first serious rival of the *Illustrated London News* was published, the *Graphic,* produced by W. L. Thomas. *Black and White,* a paper of the same class as the *Illustrated London News,* followed in 1891; and in 1892 the *Sketch* was started by Sir William Ingram, under the editorship of Shorter, as a social and theatrical illustrated weekly.

From this time forward, many illustrated weeklies were started in the fields of the theatre, sports, fashion and society. In 1926 William Harrison brought all the leading illustrated papers under the management of Illustrated Newspapers Ltd. In 1937 this concern was purchased by Sir John Ellerman and Lord Southwood, the former taking a controlling interest.

BRITISH SUNDAY NEWSPAPERS

The *Observer,* most powerful political organ among the Sunday newspapers, was founded in 1791. It reported the battle of Trafalgar, 1805, without headlines and ten years later Wellington's dispatch on the battle of Waterloo as if it were the heading of a parliamentary Blue Book. The *Observer* kept on its respectable but somewhat sombre career until it was acquired by Lord Astor and edited by J. L. Garvin, when it assumed a distinctive character, a virile independence in its political outlook while it made a strong feature of foreign correspondence, literature, the drama, etc. On Garvin's resignation in 1942 he was succeeded by F. D. L. Astor.

The *Sunday Times* was founded in 1822. Its course was not dissimilar to that of the *Observer* until 1915, when it was acquired by William Ewert Berry and James Gomer Berry (later Viscount Camrose and Viscount Kemsley). The former was editor-in-chief of the *Sunday Times,* 1915–37. Its circulation at mid-century was more than 500,000.

By far the largest Sunday paper, the *News of the World,* a sensational paper specializing in sports, crime, divorce cases, etc., was founded in 1843. Sir Emsley Carr was editor for half a century, from 1891 until his death in 1941. The paper passed the 1,000,000 mark shortly after the turn of the century, and by 1950 it had nearly 8,000,000 circulation—larger than that of any other newspaper in the world.

Next largest of the London Sunday papers at mid-century was the *People,* with 4,500,000, founded in 1881 and owned by Odhams Press Ltd., which also controlled the *Daily Herald.* The *Sunday Express,* founded in 1918 as the Sunday edition of the *Daily Express,* had about 2,700,000. The *Sunday Dispatch,* founded in 1801 as the *Weekly Dispatch,* became affiliated with the *Daily Mail* and had more than 2,000,000 circulation in 1950. The *Sunday Graphic,* founded 1915, became allied with the *Daily Graphic;* and the *Sunday Chronicle* became the London edition of a Manchester paper founded in 1885—each with more than 1,000,000 circulation. The *Reynolds News,* founded in 1850 and the organ of the co-operative movement, had 720,000 circulation in 1950. Finally, the *Sunday Pictorial* (1915), week-end edition of the *Daily Mirror,* was the third Sunday paper in point of circulation, with more than 4,000,000.

In the provinces, by far the largest was the *Sunday Empire News* of Manchester, founded 1884, with more than 2,000,000 circulation.

COMPETITION FOR BRITISH MASS CIRCULATION; WORLD WAR II AND AFTER

In the late 1930s, competition for the large circulations which had become necessary to attract advertising reached a climax in extravagant premium offers. Most popular were free insurance policies for readers and their families; but gifts of books, including complete sets of well-known authors, and suits of clothes, washing machines, etc., were among the subscription premiums offered. Chief competitors were the *Daily Express* and the *Daily Herald,* whose circulations, thus stimulated, soared into the millions.

By the end of the decade, the *Daily Express* had reached 2,500,000 and the *Daily Herald* 2,000,000 circulation; while the *People,* first Sunday paper to offer free insurance to its readers, had reached 3,500,000.

World War II brought this premium orgy to an end. Canvass-

ing for circulation was forbidden, and circulations were thus frozen at 1939 levels. Sizes of newspapers were drastically reduced by government order in 1940: twopenny dailies (the *Times* only) to 60 pages weekly, full-size penny dailies to 36 pages and tabloids to 72 pages.

By the end of 1940 the cost of newsprint had gone up 150% over the preceding year; before the end of the war it went up to about 165%, or £30 a ton. It was rationed on the basis of the 1939 consumption by individual newspapers. Despite paper shortage, circulations increased before the end of the war; readers maintained their demand for the four-page papers which were offered them. By 1948, British newspapers were using 7,000 tons of newsprint weekly—about one-third of the quantity used before the war. About 55% was manufactured in British mills from imported materials.

Arbitrary and erratic censorship, especially in the early months of the war, was a severe trial for the newspapers; but these conditions were improved. A code entitled *The Defense Notices* afforded a basis for a voluntary censorship program. The blitzkrieg also worked great hardships on newspapers in many ways; some of them set up duplicate press units in locations supposed to be relatively safe. There was also, of course, a crippling shortage of trained manpower.

But enforced economies in newsprint, promotion, labour, etc., together with government advertising and increased reader demand, made newspaper publishing profitable during the war period; and more concise reporting and closer editing improved some phases of journalism.

In 1949 the royal commission on the press, set up to investigate the newspaper situation, reported that there was "nothing approaching monopoly in the Press as a whole," but that "the gap between the best of the quality papers and the general run of the popular Press is too wide." It recommended the establishment of a general council of the press. According to its report, there were 130 daily papers in England in 1948, including 18 serving special interests.

BRITISH NEWS AGENCIES

Leading agencies serving the English press with news at the mid-century were the Press association (*q.v.*), with 1,500 correspondents in the British Isles; Reuters (*q.v.*), owned since 1941 by the Press association and the Newspaper Proprietors Association, Ltd., through the Reuters trust, and having about 2,000 full-time employees all over the world; Exchange Telegraph Company, Ltd., begun in 1872, with its specialized services; the Associated Press, Ltd., with its United Kingdom report; and the British United Press, Ltd., which since 1922 had bought the United States U.P. service for Britain and Canada.

NEWSPAPERS IN THE BRITISH DOMINIONS

Canada.—The first Canadian newspaper was the *Halifax Gazette*, founded by John Bushell as a two-page weekly in 1751 (old style, still used in date line, 1752). In 1770 Anthony Henry combined this paper with his *Nova Scotia Gazette* and continued it for many years. First paper in Quebec was the *Quebec Gazette*, founded by William Brown and Thomas Gilmore in 1764, and printed in both English and French; it lasted for more than 100 years and was finally merged in the *Morning Chronicle* (1847), which after a combination in 1926 with the *Telegraph* (1872) became known as the *Chronicle-Telegraph*. First in Montreal was *La Gazette Littéraire*, founded in 1778 by Fleury Mesplet (a protégé of Benjamin Franklin) and Charles Berger; the modern *Montreal Gazette* is its descendant. First Ontario paper was another *Gazette*, Lewis Roy's *Upper Canada Gazette and American Oracle*, established in 1793 at Newark; later it was moved to York (Toronto).

At mid-20th century Canada had more than 100 daily newspapers and about 900 weeklies, semiweeklies and triweeklies. Leading English-language papers were the *Montreal Star*, founded in 1869 and acquired in its first year by Hugh Graham (later Lord Athelstone), who conducted it until his death in 1938; the *Toronto Daily Star*, founded in 1892 and purchased in 1900 by Joseph E. Atkinson, who brought it to the largest circulation in Canada, about 375,000; and the *Toronto Globe and Mail*, the result of a consolidation by C. George McCullagh, who bought the *Globe* (1844) in 1936 for $1,850,000 and a month later the *Mail and Empire* (1872) for $2,020,000, adding the evening *Telegram* (1876) to his holdings in 1948. The chief French-language paper, *La Presse* of Montreal, was founded in 1884 and conducted for many years by Trefflé Berthiaume. The French-language papers are found chiefly in the province of Quebec, which in 1950 had 12 of them published daily, including *Le Soleil* (1880) and *L'Action Catholique* (1907), important papers of the city of Quebec. The leading paper in the west at mid-century was the *Vancouver Sun* (1886). In 1949 the four Halifax papers were brought under one ownership, with the *Chronicle-Herald* as the morning, and the *Mail-Star* as the evening, edition.

The main groups of daily newspapers in 1950 were those headed by McCullagh, noted above; by William J. and Wilson M. Southam, who controlled the *Ottawa Citizen* (1884), *Hamilton Spectator* (1846), *Winnipeg Tribune* (1890), *Calgary Herald* (1883), *Edmonton Journal* (1903) and *Vancouver Province* (1898); and by Victor and Sir Clifford Sifton, who controlled the *Winnipeg Free Press* (1874), *Regina Leader-Post* (1883) and *Saskatoon Star-Phoenix* (1902).

The right to the distribution of Associated Press news was long held by the Canadian Pacific Railway company, but in 1910 Canadian Press Ltd. was formed as an affiliate of the A.P. Thereafter the Canadian Press added bureaus and affiliations of its own in other countries.

There were few Sunday editions of dailies in Canada at mid-century but some were issuing week-end papers; largest of these was the *Toronto Star Weekly*, with a circulation of 900,000.

Australia.—The first newspaper in Australia was George Howe's *Sydney Gazette and New South Wales Advertiser*, which was begun in 1803 and in 1825 altered its title to the *Tasmanian.* Hobart, the second Australian colony, had its first paper, the *Derwent Star*, in 1810, founded by G. P. Harris. Sydney and Hobart were the early newspaper centres; but Melbourne, with the founding of the *Herald* in 1840, the *Argus* in 1846 and the *Age* in 1854, as well as various shorter-lived papers, by the middle of the 19th century had come to share with Sydney the chief publication business in Australia.

Leading Australian journalists in the 100 years which followed were: John Fairfax, who in 1841 bought with his partner Charles Kemp the *Sydney Morning Herald*, founded in 1831 and the oldest of Australian dailies, among the half-dozen largest and still conducted by the Fairfax family at mid-20th century; David Syme, who with other members of his family conducted the *Melbourne Age* until its ownership was transferred to a public company in 1948; Sir Keith Murdoch, who with Theodore Fink developed the *Melbourne Herald* as the largest of the commonwealth's papers and the key property of a group in Sydney, Brisbane and Adelaide; Sir Langdon Bonython, who built up the largest paper in South Australia, the *Adelaide Advertiser* (1858); and Sir Winthrop Hackett, founder of the *West Australian*, Perth tabloid. Other important papers in 1950 were the *Daily Telegraph*, *Daily Mirror* and *Sun* of Sydney; the *Melbourne Sun News-*

Pictorial, Australia's only daily pictorial, which claimed 400,000 circulation; and the *Courier-Mail* and *Telegraph* in Brisbane.

The Australian Associated Press, using a variety of overseas services, furnishes its report of foreign news to most of the Australian dailies, some of which also have foreign correspondents.

New Zealand.—Pioneer English settlements in New Zealand made haste to establish newspapers even before many houses were built. Thus the Wakefield expedition of 1839 got out a paper (Samuel Revans, editor) at Port Nicholson, now Wellington; and a few months later, in 1840, the official Hobson expedition started the *New Zealand Advertiser* at its Bay of Islands settlement (now Kawakawa). These papers were all short-lived. At New Plymouth the evening *Taranaki Herald* and the morning *Taranaki Daily News* (long conducted by the well-known T. C. List) were established respectively in 1852 and 1857. The former at mid-20th century was the oldest paper in New Zealand.

In 1950 the largest paper of the dominion was the *New Zealand Herald* (1863). The *Wellington Evening Post* was founded by Henry Blundell in 1865; Wellington's morning paper, the *Dominion,* was founded in 1907 by C. W. Earle.

Christchurch journalism began with the *Lyttleton Times,* which was founded in 1857 within a month of the landing of the Canterbury settlers, and became the leading Liberal paper of New Zealand under Sam Saunders. In 1935 there was a bitterly competitive war among the four Christchurch papers, which ended by New Zealand Newspapers Ltd., already owners of the *Christchurch Star,* buying the *Sun,* and the *Press* absorbing the *Lyttleton Times.* At Dunedin, the *Otaga Daily Times* (1861), long edited by Sir James Hutchison, and the *Evening Star* (1863) became flourishing papers. The provincial press is strong.

The Press Association is the news agency in New Zealand; it receives most of its overseas news from the Australian Associated Press.

Union of South Africa.—The first South African newspaper was the *Cape Town Gazette and African Advertiser,* begun in 1800 by Walker & Robinson, a firm of merchants who had imported a press. Taken over by the government as an official bulletin, published during Dutch control 1802–06 as *Kaapsche Courant* and later resumed as an authorized paper with its former name, the *Gazette* had no competition until 1824. The *South African Commercial Advertiser* was begun by George Grieg Jan. 7, 1824, with John Fairbairn and the poet Thomas Pringle as editors. This paper was twice forcibly suspended, but appeals to England brought freedom from government control in 1829. A period of activity in Capetown journalism followed. *Die Zuidafrikaan* was founded in 1830, lasting until 1894.

Dutch and English and bilingual papers competed for favour, and the use of bilingualism persisted, among country weeklies especially. Eventually Afrikaans, as distinguished from Nederlands, came into use for the "Dutch" papers.

The first Natal paper was *De Natalier* (1844); first in the Orange Free State was *The Friend of Sovereignty and Bloemfontein Gazette* (1850); and first in the Transvaal, if we omit a *Government Gazette,* was *De Oude Emigrant* (1859), at Potchefstroom. The native Bantu press consisted in 1950 of about 25 papers in ten towns, some of them printed in three or four languages, or even more.

Johannesburg, largest city in the Union, had two morning papers at mid-century—*Rand Daily Mail* (1905) and *Die Transvaaler* (1937); and two evenings—*Star* (1887) and *Die Vaderland* (1905). Likewise, Capetown had the mornings *Cape Times* (1876) and *Die Burger* (1915), and the evenings *Cape Argus* (1857) and *Die Suiderstem* (1936). Durban had *Natal Mercury* (1853) in the morning and *Natal Daily News* (1919) in the afternoon. Pretoria had two evening papers—*Die Volkstem* (1873) and *Pretoria News* (1898). Bloemfontein had the morning *Friend* (1850) and the evening *Volksblad* (1915). Other cities with a single daily each were Queenstown, Port Elizabeth, Pietermaritzburg, Kimberley, East London and Grahamstown.

NEWSPAPERS IN THE UNITED STATES

Although printing presses were established at Cambridge, Massachusetts Bay Colony, in 1638, at nearby Boston in 1674 and at Philadelphia in 1685, nothing that could properly be called a newspaper was published in the American Colonies until Benjamin Harris issued his *Publick Occurrences Both Forreign and Domestick* in 1690. Free speech and free printing had no legal standing in the Colonies in the 17th century. Royal charters commonly contained provisions for licensing the press, but the governors regarded printing as dangerous. Packets of newspapers were brought over from England, and at least two issues of the *London Gazette* were reprinted in the Colonies. A few professional newsletter writers did some business, and private letters of news were passed from hand to hand. Ballads, proclamations and pamphlets contained some news. In 1689 Massachusetts leaders compiled and published a news broadside entitled *The Present State of New-English Affairs* in order "to Prevent False Reports," and to tell of Increase Mather's efforts in behalf of a new charter following the overthrow of Gov. Sir Edmund Andros.

First Newspapers.—The next year Benjamin Harris, London bookseller and publisher who had fled England after imprisonment for printing a seditious pamphlet, issued in Boston No. 1 of *Publick Occurrences Both Forreign and Domestick,* to be "furnished once a moneth (or if any Glut of Occurrences happen, oftener)," on Sept. 25, 1690. Four days later the governor and council suppressed it. This first American newspaper, which was thus ended summarily with its first number, was a very newsy three-page paper (the fourth page being left blank for private correspondence), measuring 6 in. by 9½ in. when folded.

Fourteen years passed before the next venture in American newspaper publishing. In 1704 John Campbell, newsletter writer, bookseller and postmaster, established the *Boston News-Letter,* the first continuously published American newspaper, and issued it "By Authority" for 15 years. Thereafter it was published until the Revolution; then a Tory paper, it suspended shortly before the British evacuation of Boston. In 1719 William Brooker was appointed postmaster at Boston; and since Campbell refused to turn over the *News-Letter* to him, he founded the *Boston Gazette.* This paper had a long and influential career; during the struggle for independence it was edited by Benjamin Edes and John Gill, called "trumpeters of sedition" by their Tory enemies. It survived the Revolution but perished in 1798.

First printer of the *Gazette* was James Franklin, who had as apprentice his 13-year old brother Benjamin. When Brooker lost both post office and newspaper in 1721, and the new proprietor took the printing of the *Gazette* to another shop, Franklin started a new paper called the *New-England Courant.* During its five and one-half lively years, the *Courant* was a spectacular sheet, first as an opposition organ critical of the Mather regime, and later, after the council had banned James Franklin as publisher, as a repository of periodical essays. To evade the council's order, James put his brother Benjamin in as nominal publisher. The latter had already written his first satirical essays, the early "Dogood Papers," for the *Courant;* but his brother treated him ill, and he soon ran away to Philadelphia.

Early Papers in Philadelphia and New York.—The *American Weekly Mercury* narrowly missed being the third American newspaper; its first issue, Dec. 22, 1719, was only one day later than that of the *Boston Gazette.* It was founded by Andrew Bradford, son of the William Bradford who introduced printing into Pennsylvania but who by this time had moved his press to New York. The second Philadelphia newspaper was begun by Samuel Keimer with the extraordinary title, *The Universal Instructor in All Arts and Sciences, and Pennsylvania Gazette,* in 1728. The first part of the title was due to the project of Keimer, a scientific deist and an eccentric, to print Ephraim Chambers' *Cyclopaedia* serially in his paper. Benjamin Franklin,

now established as a printer in Philadelphia, helped to give the rival *Mercury* a competitive advantage in the town by writing his "Busy-Body Papers" for it, and in 1729 bought Keimer out. He abandoned the cyclopaedic serial, cut off the grandiloquent prefix of the paper's title, and made such a success of the *Pennsylvania Gazette* that he was able to retire with a competency at 42. He sold the *Gazette* in 1748 to David Hall, who, with his sons and grandsons and various partners, conducted it until its end in 1815.

Meantime, William Bradford had founded the first New York newspaper in 1725, under the title *New-York Gazette.* It was definitely an organ of government in that colony, and when the bitter contest between Gov. William Cosby and the popular party developed in 1733, John Peter Zenger was induced to start an opposition paper. His paper was supported by the contributions of James Alexander and other leaders of the popular party, much as James Franklin's crusading paper in Boston had been aided by a group of dissident writers there. When Zenger was jailed in 1734, Cosby disbarred the attorneys who were defending him, and Andrew Hamilton, a famous Philadelphia lawyer, was brought in to plead his case. Hamilton's masterly argument brought acquittal and was later reprinted as a pamphlet and did much for the cause of liberty in both England and America.

Other Colonial Beginnings.—The initial papers in other Colonies were *Maryland Gazette,* Annapolis, 1727, and *Virginia Gazette,* Williamsburg, 1736, both founded by William Parks, one of the best of the colonial printers; *Rhode-Island Gazette,* Newport, 1732, founded by James Franklin, who had moved his press there from Boston but was able to maintain the paper for only eight months; *South-Carolina Gazette,* Charleston, 1732, founded by one of Benjamin Franklin's printers, and carried on by another Franklin protégé, the talented Lewis Timothy; *North-Carolina Gazette,* New Bern, 1755, founded by James Davis; *Connecticut Gazette,* New Haven, 1755, founded by Timothy Green; *New-Hampshire Gazette,* Portsmouth, 1756, founded by Daniel Fowle, a paper which lived for 190 years; *Georgia Gazette,* Savannah, 1763, founded by James Johnston; *New-York Gazette,* 1776, by chance New Jersey's first paper, since Hugh Gaine moved this sheet to Newark when the British occupied New York. John Adams, a Wilmington printer, is reported to have published a paper called the *Courier* in that town for a few months in 1762, but the earliest Delaware paper of which we have definite knowledge is the *Delaware Gazette,* begun at Wilmington in 1785 by Jacob A. Killen. The *East-Florida Gazette,* published at St. Augustine in 1783–84 by the Tory editor John Wells, was the first paper in what was later the state of Florida. Timothy Green, fourth of that name in a long line of printers, established the first Vermont paper in collaboration with J. P. Spooner; it was the *Vermont Gazette and Green Mountain Post-Boy,* of Westminster. The first paper in what is now Maine was the *Falmouth* (Portland) *Gazette,* founded in 1785 by Benjamin Titcomb, Jr., and Thomas B. Wait.

Patriots and Tories.—Leading patriot newspapers during the period extending from the enactment in 1765 of the Stamp act, which taxed the newspapers and aroused them to bitter opposition and noncompliance, to the end of the American Revolution were: the *Boston Gazette,* to which Samuel Adams and his group contributed; the *Massachusetts Spy,* founded in 1770 by Isaiah Thomas, who was later a successful book publisher as well as journalist and the founder of the American Antiquarian society; the *Connecticut Courant,* of Hartford, founded in 1764 by Thomas Green; the *New-York Journal,* founded in 1767 by John Holt; the *New-York Packet,* founded by Samuel Loudon in 1775; the *Pennsylvania Journal,* founded in 1742 by William Bradford, grandson of the pioneer printer of the same name, himself an able editor and the outstanding soldier-editor of the Revolution; the *Pennsylvania Gazette,* conducted at this time by David Hall; the *Pennsylvania Packet,* founded in 1771 by John Dunlap, another soldier-editor, who later joined with David C. Claypool to make this paper one of the most successful in America during the years immediately after the war; and the *South-Carolina Gazette,* whose war editor was Peter Timothy. These papers had many bitter experiences during the war. While the British occupied Boston, the *Gazette* found a temporary home at Waterton, while the *Spy* moved permanently to Worcester. The New York papers had to find temporary homes in towns up the Hudson river when the city was lost to the patriots, and the patriot papers of Philadelphia were refugees during the shorter British occupation of their city. When Newport, R.I., was taken, Solomon Southwick buried his press and type; later he exhumed them to continue the long career of his *Mercury.*

Leading royalist papers were: the *New York Gazetteer,* founded in 1773 by James Rivington; the *New-York Weekly Gazette and Mercury,* founded in 1753 by Hugh Gaine; the *Royal American Gazette* of New York; the *Royal Pennsylvania Gazette* of Philadelphia, published briefly by James Robertson; and the *Pennsylvania Evening Post,* founded in 1775 by Benjamin Towne, who was later to make his paper the first American daily.

Characteristics of Colonial Papers.—American newspapers in the colonial period were modelled on those of the mother country. The common size was four pages, each about 10 in. by 15 in. Extra pages were sometimes issued to accommodate heavy advertising. Headings of news stories were little more than date lines. The successful papers had good advertising patronage; advertisements were set single-column with little display, so that a page of them resembled modern classified make-up. Paper was obtained chiefly from England until the tax on that staple stimulated American manufacture. The collection of rags from which paper was made was regarded as a patriotic duty during the Revolution.

Manufacture of ink, type and presses was also built up in America when importation was interrupted.

Chief news sources were the English newspapers, since interest in events in the homeland was paramount among the Colonists. The second important source was "exchanges"—papers published in other American towns. The rule was for an editor to cover any news of first-rate importance in his own neighbourhood for his own paper, and for other papers to clip it; thus all colonial papers were members of an informal co-operative news-gathering system. Local news coverage was not intended to be thorough, and small happenings were usually disregarded; there were no local reporters, and the editors were commonly imbued with the concept of news as historical record. Other sources than those mentioned were letters from other cities or from England brought in by friends of the editor; word-of-mouth reports by ship captains, postriders and travellers; and official documents and communications. With the coming of the war, English papers were cut off almost altogether, and military operations interfered with colonial communications; but patriot committees were active in sending news bulletins from one town to another.

There were no editorial pages, but editorial comment was interspersed with the news. Political and economic dissertations, satirical essays on social customs and poetry were common.

The Daily Newspaper.—A few semiweeklies and triweeklies had been published in the Colonies. For example, Benjamin Towne's *Pennsylvania Evening Post* had been established as a triweekly; in 1783 Towne made it the first American daily. Generally it consisted of only two pages, and was a rather shabby sheet. Towne was indicted for treason a few months after he made his paper a daily, and its 17-month existence in that status was shadowed by its editor's disrepute. John Dunlap and David C. Claypool's *Pennsylvania Packet and Daily Advertiser* began daily publication in 1784. It was very successful, as was the *New York Daily Advertiser,* founded in 1785 by Francis Childs; the latter was the first American paper to be founded as a daily.

Dailies came into the picture less for the purpose of giving timely news than because publishers wished to compete with the coffee-shop bulletins in giving reports to merchants of the offerings of importers just as soon as ships arrived in the harbours of Philadelphia and New York. The political papers of the cities also adopted daily publication rather generally by the end of the 18th century, leaving the weeklies to the smaller towns.

The Party Press.—As national issues developed, newspapers

took up the cudgels of partisan strife. From the second administration of George Washington until after the Civil War, ardent partisanship in journalism was the rule. The mercantile papers, as well as those confessedly established as political organs, took sides; and when the penny papers appeared in the 1830s, with their emphasis on local news and human-interest features, they, too, were soon involved in party controversy. At its height during the first two decades of the 19th century, this partisanship resulted not only in slanting and distorting news but in personal abuse and vilification of political figures, duels and assaults among editors and much prostitution of the newspaper's chief duty of disseminating the news accurately, fairly and fully. The situation improved in the 1840s and 1850s, but it was not until the doctrine of partisan independence made its great gains in the 1870s that biased reporting of public affairs was abated.

First national political organ was John Fenno's *Gazette of the United States* (1789–1818), Federalist, established at New York when the capital was situated there and later moved with the government offices to Philadelphia. Its great rival in the latter city was Philip Freneau's *National Gazette* (1791–93), Republican (Democratic). Alexander Hamilton and Thomas Jefferson, rivals in Washington's cabinet, were the respective sponsors of Fenno and Freneau in their editorial efforts. Supplanting the *National Gazette* as spokesman for the Jeffersonian Republicans was the Philadelphia *Aurora*, founded by Benjamin Franklin Bache, grandson of Benjamin Franklin, in 1790. Another notable political paper in that city was *Porcupine's Gazette* (1797–99), edited in vitriolic fashion by William Cobbett, at the time a refugee from England. In Boston Benjamin Russell's *Columbian Centinel* became a nationally recognized Federalist organ; founded in 1784, it was in many respects an excellent newspaper. Noah Webster, later famous as a lexicographer, founded the *American Minerva* in New York in 1793 as a Federalist organ; four years later this paper adopted the name *Commercial Advertiser*, which it kept for more than a century.

One cause of the Alien and Sedition acts (1798–1801) is to be found in the prevailing scurrility of attacks on public officers, but the immediate occasion was the threat of war with France and the consequent need to guard against disloyalty. There were about 25 arrests under the Sedition act and 11 trials resulting in 10 convictions. Actions under the common law brought total convictions to 15, of which 8 related to newspapers. But the censorship involved was greater than these figures indicate. The acts expired with the John Adams administration. Two years later Alexander Hamilton, in an argument for a new trial in the case of Harry Croswell, editor of the Hudson, N.Y., *Wasp*, advanced the "Hamiltonian doctrine," later made a part of most state constitutions, to the effect that evidence of the truth of statements published with good intentions may be introduced by the defense in a criminal libel suit.

The *National Intelligencer*, established in Washington in 1800 as the organ of the Jefferson administration by Samuel Harrison Smith, proved to be mild in partisanship and reliable in news. Conducted after 1810 by Joseph Gales, Jr., and W. W. Seaton, the *Intelligencer* was considered by other papers for many years as the authority on Washington news. It was displaced as the government organ, however, when Andrew Jackson became president. Duff Green's *United States Telegraph* (1825) was Jackson's first Washington paper; it was supplanted in 1830 by the *Washington Globe*, edited by Francis P. Blair. Associated with the *Globe* also were Amos Kendall, editorial writer, and John C. Rivers, business manager, who, with Blair, were members of Jackson's "kitchen cabinet" of political advisers.

Meantime, in New York, James Cheetham's *American Citizen* was the vituperative organ of the George Clinton faction of the Democratic party during the first decade of the 19th century. Established largely in order to combat Cheetham's sheet was the *New York Evening Post*, founded in 1801 by Alexander Hamilton and friends associated in a joint-stock company. William Coleman was its first editor; he was followed in 1829 by William Cullen Bryant, who edited the paper until his death in 1878.

The Penny Press.—The chief characteristics of the penny press of the 1830s were smaller size, a one-cent price in comparison with the six cents charged by the larger papers, and adaptation to lower economic and social levels of readership. The penny papers featured local and human-interest matter, preferred news above support of a party or mercantile class, exposed abuses of banks and churches and tended to give a realistic picture of the news scene despite taboos.

The first successful penny daily was the *New York Sun*, founded in 1833 by Benjamin H. Day. Most important of its rivals in this field was the *New York Herald*, begun two years later by James Gordon Bennett. Three New York printers, William M. Swain, A. S. Abell and A. H. Simmons, founded the *Philadelphia Public Ledger* in 1836 and the *Baltimore Sun* in 1837; Swain was chiefly responsible for the former and Abell for the latter over many years. In 1841 Horace Greeley founded the *New York Tribune* as a penny paper, and ten years later the *New York Times* was started by Henry J. Raymond, George Jones and Edward B. Wesley at the same price. All these New York papers except the *Sun* soon went to the two-cent price, enlarging their size and scope. The penny papers initiated what may be called modern journalism by their emphasis on local news and timeliness. They were leaders in the use of expresses and the telegraph for quick transmission of news, and their large circulation and advertising receipts enabled them to improve their news services and install fast cylinder presses.

Bennett and Greeley, rival editors through three decades (both died in 1872), were leading figures in a period of personal journalism. Bennett was one of the most original of editors, initiating financial and society departments and playing a part in many other innovations. Greeley was the great idealist, a crusader against slavery and intemperance and in favour of westward expansion. His hospitality to new ideas brought Fourierism, spiritualism, women's rights, Grahamism and many other reforms and fads into the columns of the *Tribune*. His alliance with Thurlow Weed, the political boss who was editor of the *Albany Journal*, 1830–63, and William H. Seward was dissolved in 1854 by a letter in which he showed his resentment because he had not been given political office; later he had much to do with the defeat of Seward for the Republican presidential nomination. The *Tribune* did not always support Lincoln during his administration, however.

In Springfield, Mass., the *Republican* was begun as a two-cent daily in 1844. Its weekly edition had been founded by Samuel Bowles 20 years earlier, but the daily was the project of a son, also called Samuel, aged 18. It became one of the most famous of small-city dailies, and exerted a wide influence, largely through its weekly edition, for many years. Following a printers' strike in 1947, it was reduced to the status of a Sunday paper.

In New Orleans, George W. Kendall and Francis Lumsden started the *Picayune* in 1836, and it soon gained a wide reputation not only as a good newspaper but as a repository for amusing sketches and witty paragraphs. During the Mexican War, Kendall became the first important and regular reporter of military actions from the field.

The war with Mexico was a great stimulant to speed in news transmission. The expense of efforts in this direction led to the first important effort in co-operative news gathering—the New York Associated Press, founded in 1848, forerunner of the present Associated Press. This group consisted of the *Sun*, *Herald*, *Tribune*, *Express*, *Courier and Enquirer* and *Journal of Commerce*—the leading papers of the metropolis. When the *Times* was begun, it was taken in. The *Express* (1836–81), conducted by James and Erastus Brooks, was a strong mercantile paper. The *Courier and Enquirer* was the result of a merger in 1829 of Mordecai M. Noah's *Enquirer* and James Watson Webb's *Morning Courier*. Under Webb's aggressive editorship it was bright, bellicose and enterprising. The *Journal of Commerce* was founded in 1827 by Arthur Tappan as a commercial paper with a strong religious bent; it soon became the property of Gerard Hallock and David Hale.

The Westward Movement.—The first newspaper west of the Appalachians was the *Pittsburgh Gazette* (*Gazette Times*,

1906; *Post-Gazette,* 1927), founded by John Scull and Joseph Hall in 1786. The following year the *Kentucky Gazette* was founded at Lexington by John Bradford. First paper in what is now West Virginia was the *Potowmac Guardian,* begun by Nathaniel Willis in 1790. Tennessee's first paper was the *Knoxville Gazette,* 1791, George Roulstone founder. Benjamin M. Stokes started the first Mississippi paper, the *Mississippi Gazette* (1799–1801) at Natchez. The first New Orleans paper was *Moniteur de la Louisiane,* 1794, by Louis Duclot, a sheet of four small pages in French. The earliest paper in what is now Alabama was the *Mobile Centinel* (1811–12) by Samuel Miller and John B. Hood.

First newspaper to be established in what is now Ohio was the *Centinel of the North-Western Territory,* founded at Cincinnati by William Maxwell in 1793. First in Indiana was Elihu Stout's *Indiana Gazette,* later *Western Sun,* at Vincennes in 1804. Joseph Charless founded the *Missouri Gazette* in 1808; it was the first paper printed wholly in English west of the Mississippi. Its name was later changed to *Missouri Republican* and in 1888 to *Republic;* it was merged with the *St. Louis Globe-Democrat* in 1919.

First Michigan paper was the *Michigan Essay,* produced briefly under the patronage of Gabriel Richard, a Catholic missionary; the first Michigan paper of longer life was the *Detroit Gazette* (1817–30). In 1814 Matthew Duncan brought his press up from Kentucky and founded Illinois' first paper at Kaskaskia, the *Illinois Herald,* which he later moved to the new capital at Vandalia and renamed the *Illinois Intelligencer.* The first Chicago paper was the *Democrat,* founded in 1833 by John Calhoun, later mayor of the city; it was merged with the *Tribune* in 1861. In 1819 the *Arkansas Gazette* was begun by William E. Woodruff at Arkansas Post; it was moved to Little Rock when that settlement was chosen as the capital.

First newspaper in Wisconsin territory was the Green Bay *Intelligencer* (1833–36). First in Iowa was John King's *Dubuque Visitor* of 1836, and first in Minnesota James M. Goodhue's *Minnesota Pioneer* of 1849, later famous as the *St. Paul Pioneer Press.* In 1854 the *Nebraska Palladium,* which had been begun in Iowa, was moved across the river to Belleview and published for several months in the new territory. First Kansas paper was a missionary sheet in an Indian language called in English *Shawnee Sun,* published in 1835 at the Baptist mission; first English-language paper in that territory was the *Kansas Weekly Herald* (1854–61), of Leavenworth. The pioneer Kansas papers were embroiled in the free-state war of 1855. The Lawrence *Herald of Freedom* office was destroyed by the proslavery faction, but it gave its type to be moulded into balls used for the attack on Fort Titus, so that the discharges of the antislavery cannon were called "new editions" of the *Herald.*

The *Sioux Falls Democrat* was first of South Dakota papers in 1858; its name was soon changed to *Northwestern Independent.* The Fort Union *Frontier Scout* of 1864 was North Dakota's first paper.

In the southwest, Oklahoma's first paper was a Baptist missionary organ, the *Cherokee Messenger,* printed in an Indian language, near the present site of Westville, in 1844–46. Pioneer Texas paper was the organ of the provisional revolutionary government at San Felipe called *Telegraph and Texas Register,* 1835; it had an adventurous career before it became the first Houston newspaper. A small campaign sheet called *El Crepusculo,* published in Santa Fe by Antonio Barreiro, was apparently the first publication in New Mexico; but the first real newspaper was the *Santa Fe Republican* (1847–49), with two pages in English and two in Spanish. The *Weekly Arizonian,* Tubac, 1859, was the first paper in Arizona.

California's first paper was founded in 1846. It was a small sheet printed on one side only at Monterey, and was called *The Californian.* It was soon moved to what is now San Francisco, where the *California Star* had been established in 1847. Both were absorbed into the *Alta California* when that famous paper was set up in 1849. The first paper printed in Nevada was the *Territorial Enterprise,* begun in 1858 at Genoa, but more famous as the Comstock Lode organ at Virginia City, where Mark Twain and Dan De Quille worked on it. Another gold rush brought Colorado's first paper, the *Rocky Mountain News,* founded in Denver by William N. Byers in 1859; it became a Scripps paper in 1926. Other western "firsts" were the *Oregon Spectator,* Oregon City, 1846; the *Columbian,* of Olympia, Wash., 1852; the *Deseret News,* famous Mormon paper in Salt Lake City, Utah, 1850; the *Golden Age,* Lewiston, Ida., 1862; the *Montana Post,* begun in 1864 at the Virginia City gold camp and moved to Helena in 1868; and the *Fort Bridger Daily Telegram* of 1863, first Wyoming paper and the only first paper in any state which began as a daily.

The Civil War and Reconstruction.—The Civil War was well covered by special correspondents in the field, more than 150 of whom served northern papers during the war. Military restrictions, government control of telegraph lines, and mob violence—all sporadic—curbed press activity; but there was no regular and consistent censorship. A number of papers were forced to suspend publication by military commands or the post-office department.

Among these were the *New York Daily News* and the *Chicago Times.* The *News,* founded in 1855, was a penny paper, organ of the Tammany Democracy; it had come into the hands of Benjamin Wood, brother of Fernando Wood, New York's mayor. The Woods were strongly proslavery, and a combined military and postal blockade forced the *News* to close down for 18 months in 1861–62. After the war, this paper won a very large circulation in the tenement-house districts as a penny sensation-monger. Wood lived until 1900, and the next year Frank A. Munsey bought the *News* from his widow for 340 thousand-dollar bills. Munsey improved it so much that it lost its public, and it perished in 1906. The *Chicago Times,* founded in 1854, had been bought by Wilbur F. Storey in 1861. Its verbal attacks on the union army caused Gen. A. E. Burnside to seize and suspend the paper, but after three days Pres. Abraham Lincoln requested that the order be rescinded. The *Times* became a successful sensation paper after the war, receding only as the *Tribune* came to control the Chicago morning field. It ended in a consolidation in 1895.

The *Chicago Daily Tribune* was founded in 1847; it had a difficult time until Joseph Medill and five partners (including Charles H. Ray and Alfred Cowles) took it over in 1855. After Medill gained control of the paper in 1874, he directed its destinies until his death 25 years later, making it a strong and successful paper.

A leading newspaper development of the 1870s was the rise of the *New York Sun* in prestige and influence. Purchased in 1868 by Charles A. Dana and associates, it soon became one of the best-written and edited papers in the country, independent in politics, bright and saucy, its human-interest stories of the great city one of its chief attractions. The *Evening Sun* was launched in 1887.

Notable in the 1870s also was the growing independence of the press from party control. Dating from the secession of Republican papers from the Ulysses S. Grant forces in 1872, what was sometimes called the "mugwump" movement gained in strength and caused the defeat of James G. Blaine in 1884. By 1880 one-fourth of American newspapers were listed in the directories as independent; by 1890 the proportion had reached one-third. By the 1940s, 48% of the daily papers listed themselves as "independent" and another 24% as "independent Republican" or "independent Democratic."

The "New Journalism."—Joseph Pulitzer, Hungarian-born immigrant who had made a success of the *St. Louis Post-Dispatch,* which he had formed in 1878 of the unimportant *Dispatch* (founded 1864) and John A. Dillon's *Post* (founded 1875), upset the New York newspaper situation in the 1880s and did more than anyone else to set the pattern of modern journalism. In 1883 he bought the *New York World* and soon made it the country's most successful newspaper.

The *World* had been founded in 1860 by Alexander Cummings as a religious daily, but it did not flourish and soon came into the hands of Democratic politicians and financiers. In 1869 Manton

Marble purchased majority control, and under his editorship the paper was influential and moderately successful. When he retired in 1876, the *World* came under the control of Thomas A. Scott, of the Pennsylvania Railroad, who unloaded it on Jay Gould in connection with a railroad deal. The paper had been losing $40,000 a year when Pulitzer bought it. The *Evening World* was established in 1887. The *Sunday World*, with a record-breaking circulation of 250,000, consisted of 26 to 44 pages, half advertising. The combined circulation of the dailies (374,000 by 1892) exceeded those of any two competitors. The *World* had become the most profitable paper published.

Other important New York papers in the 1870s and 1880s besides the *World, Sun* and *Daily News* were the *Herald*, under the control of James Gordon Bennett, Jr., 1872–1918, during which years he lived chiefly in Paris; the *Tribune*, under Whitelaw Reid 1872–1905; the *Evening Post*, under Edwin Lawrence Godkin 1883–99; the *Times*, under George Jones 1869–91; the *Commercial Advertiser*, descended from Noah Webster's *American Minerva*, under Hugh J. Hastings 1868–83; and the *Mail and Express*, a consolidation formed by Cyrus W. Field in 1882 and edited and published in the 1880s by Elliott F. Shepard.

In Philadelphia, a leading paper was the *Public Ledger*, published 1864–94 by George W. Childs. Later it came into the hands of Adolph S. Ochs, who sold it to Cyrus H. K. Curtis, the magazine publisher; Curtis made a great but unprofitable paper of it, and it perished in 1942. The *Record* was founded by William J. Swain in 1870 and published by William M. Singerly 1877–98. It was published by Thomas B. Wanamaker 1902–28, and by J. David Stern until it was sold to the *Bulletin* in 1947. The *Press* was founded in 1857 by John W. Forney, conducted in the 1880s by Charles Emory Smith, and merged in the *Public Ledger* in 1920. The *Inquirer*, founded in 1829, was long conducted by Jesper Harding and his son William W., and later by the Elverson family; it was bought in 1936 by M. L. Annenberg. The *Times* was founded in 1875 by Alexander K. McClure to become a great crusading paper. The *Evening Item*, founded in 1847 by Thomas Fitzgerald and conducted by him and his sons for nearly half a century, gained a large circulation. The *Evening Bulletin*, founded on the basis of the *American Centinel* (1816–46) by Alexander Cummings, was Philadelphia's first afternoon paper. In the 20th century, under William L. McLean and his sons, it gained the largest circulation in the city.

In Washington, D.C., the *National Republican* (1860–88) was edited by W. J. Murtagh. The *Evening Star*, established in 1852, was purchased in 1867 by a group headed by Crosby S. Noyes and later conducted by his sons Frank B. Noyes and Theodore W. Noyes. The *Post*, founded by Stilson Hutchins in 1877, was edited by him until 1889. After a varied career, the *Post* was bought at auction in 1933 by Eugene Meyer, who made it again a successful newspaper.

In Boston, the *Herald*, founded in 1844, was a leader under the editorship, 1862–87, of E. B. Haskell. In 1912 it bought the *Traveller*, founded in 1845, as its evening associate. The *Daily Advertiser*, founded in 1813, and made by Nathan Hale the first successful daily in New England, seemed moribund in the 1880s; but it lived to be made a tabloid by William Randolph Hearst in 1938, and later to become the *Sunday Advertiser*. The *Post*, founded by Charles G. Greene in 1831, also declined in the '80s, but had a rebirth under Edwin A. Grozier in 1891. The *Journal*, founded in 1833, was edited by W. W. Clapp in the 1880s in the sensational manner of the "new journalism." The *Transcript* (1830) was edited in this decade by Edward H. Clement; for many years it was the great newspaper organ of Boston culture, but it died in 1941. The *Globe* (1872) was highly successful under Gen. Charles H. Taylor, its publisher, 1873–1921.

In Atlanta, Ga., Henry W. Grady in 1880 bought a quarter interest in the *Constitution* (1868) and as its managing editor made it a great newspaper; he died in 1889 and was succeeded by Clark Howell. In Louisville, Ky., Walter N. Haldeman consolidated the *Courier* and *Journal* in 1868, and put in charge Henry Watterson, who made the *Courier-Journal* famous and remained in service until 1919. In Cincinnati, Murat Halstead became editor of the *Commercial* (1843) in 1865; it became the *Commercial Gazette* when it was consolidated with the *Gazette* (1815) and Halstead sold it in 1890. John R. McLean took over the management of the *Cincinnati Enquirer* (1842) in 1870, and bought it from his father in 1881; in 1895 he bought also the *New York Journal* and in 1905 the *Washington Post*. Cincinnati's evening papers, the *Times* (1840) and the *Star* (1872), were merged in 1880 by Charles P. Taft. The great San Francisco paper of the period 1870–90 was the *Chronicle*, founded in 1865 by two brothers in their teens, Charles and Michel H. de Young; it was a lively, fighting paper, and Charles de Young was shot and killed in 1880 in connection with a political fight. The *Call* (1856) and the *Bulletin* (1855) were under the same management; much later (1928) they were consolidated by Hearst. The *San Francisco Examiner* (1865) was bought by George Hearst in 1880 to further his political ambitions. The best-known editor in the Pacific northwest for many years was Harvey W. Scott, who edited the *Portland Oregonian* 1865–1910.

The great event in Chicago journalism in the post-Civil War period was the founding of the *Daily News* as a penny paper by Melville E. Stone in 1875. When the paper was on the verge of failure after a few months, Victor F. Lawson came in as partner, bringing needed capital. A liberal, crusading paper, the *Daily News* made a great success. In 1888 Stone sold out to Lawson, later becoming the first general manager of the reorganized Associated Press. The *Herald* was founded in 1881 by James W. Scott, who combined it with the *Times* in 1895. The *Times-Herald* became the *Record-Herald* when Herman Kohlsaat, its owner since the consolidation, bought the *Record*, morning edition of the *Daily News*, in 1901 and made a new combination; after Kohlsaat's *Inter Ocean* (1872) was merged in the *Record-Herald* in 1914, it became the *Herald* again, but four years later Hearst bought it and merged it with his *Examiner* as the *Herald-Examiner*, later the *Herald-American*.

In Kansas City, Mo., William Rockhill Nelson and Samuel E. Morss began the *Star* in 1880 as a small two-cent daily. Morss dropped out on account of ill health after a year or two, but Nelson made the *Star* a strong, crusading local newspaper, adding a Sunday edition in 1894, buying the *Times* (1868) for its morning edition in 1901 and starting the *Weekly Star* as a farm paper in 1890. Nelson died in 1915, and the paper was purchased by staff members for $11,000,000. Henry J. Haskell became editor in 1928.

Yellow Journalism.—William Randolph Hearst's first paper was the *San Francisco Examiner*, which his father, George Hearst, turned over to him. Successful in his management of that paper, he went to New York in 1895 and bought the *Journal*. With this paper he challenged the supremacy of Pulitzer's *World* in New York. Some of his staff he brought from San Francisco and some he hired away from the *World*. He outdid his rival in sensationalism, crusades and Sunday features. A comic picture series called "The Yellow Kid" was drawn by Richard F. Outcault for the *Sunday World* and later for the *Sunday Journal*, but after the departure of the originator to the rival paper it was drawn by George B. Luks for the *World;* these picture series excited so much attention that the competition between the two newspapers came to be called "yellow journalism." This all-out rivalry and its accompanying promotion developed large circulations for both papers and affected U.S. journalism in many cities. The "yellow journalism" formula, as it developed, was distinguished by (1) "scare heads" in large type, printed in black or red, (2) lavish use of pictures, (3) pseudoscientific articles, (4) the Sunday supplement, with coloured comics and sensational features, (5) ostentatious crusading for popular causes. The era of "yellow journalism" may be said to have ended shortly after the turn of the century, with the *World's* gradual retirement from the competition in sensationalism and the rise of the *Times*.

One of the phenomena of the era was the promotion of the war with Spain through hysterical propaganda against that nation based on exposures of Spanish atrocities in Cuba. This jingoism was not limited to the *Journal* and *World*, though they were leaders in it. Some techniques of the "yellow journalism" period

became more or less permanent and widespread, as banner headlines, coloured comics and copious illustration.

Adolph S. Ochs, publisher of the *Chattanooga* (Tenn.) *Times,* took over management of the failing *New York Times* in 1896. In 1898 Ochs reduced the price of the paper to one cent. Instead of getting into the "yellow" competition, the *Times* adopted the slogans "All the news that's fit to print," and "It does not soil the breakfast cloth." Ochs, who had actually put in only $75,000 in 1896, had a controlling interest by 1900. The *Times*'s success as a clean, conservative newspaper was one of the most striking phenomena of the new century.

"Chains" and Consolidations.—If we define a newspaper "chain" loosely enough to include affiliations formed by an uncertain degree of co-operation rather than common ownership, the groups of colonial papers of which Benjamin Franklin and Isaiah Thomas were patrons and sometimes part owners might be said to be the first American "chains." But modern "chains" began with the Scripps papers in 1878. By 1900 eight such groups could be listed, and ten years later there were a dozen and the number of papers in them had doubled. In the next decade the number of "chain" papers doubled again; and in the boom decade of the 1920s the number of "chains" reached more than 50, and the number of papers owned or affiliated in them about 300. Those statistics still held at the mid-century mark.

The first paper on which E. W. Scripps worked was the *Detroit News,* founded by his half brother James E. Scripps in 1873. The first paper he founded (with assistance from his half brothers James E. Scripps and George Scripps) was the *Cleveland Press,* begun in 1878 as a penny paper. Successful there, he persuaded his half brothers to buy the *St. Louis Chronicle* (1880–1905), with which he failed to overcome the dominant competition of the *Post-Dispatch* and *Globe-Democrat.* A little later he bought a controlling interest in the *Cincinnati Post,* and founded the *Kentucky Post* at Covington. By this time he had developed his formula, which was to establish papers in medium-sized cities with cheap equipment, put young men from his organization in charge with working partnerships, sell for a penny a copy and campaign for causes popular among the common people (often for organized labour). With Milton A. McRae as partner in the Scripps-McRae league, he bought or founded many papers in the midwest in the years 1897–1911. McRae dropped out in 1914, and in 1917, Scripps placed management in the hands of two sons, James G. Scripps and Robert P. Scripps. Three years later, a quarrel with James resulted in his being supplanted by Roy W. Howard, who had been general manager of the United Press associations, founded in 1907 as the Scripps news-gathering agency. In 1922 E. W. Scripps retired completely, turning over his newspaper properties to his son Robert, who formed the organization known as Scripps-Howard. Chief Scripps-Howard additions to the "chain" in the 1920s were the *Pittsburgh Press* (1884) in 1923 and *New York Telegram* (1868) in 1927. Most important of all was the purchase of the *New York World* in 1931, and its merger with the *Telegram.* To this combination the *Sun* was added in 1950.

The Hearst "chain" began with the *San Francisco Examiner* and the *New York Journal* and *Evening Journal.* In 1900 Hearst founded the *Chicago American* as an evening paper, and in 1902 the morning *Examiner.* In 1904 he started the *Boston American.* Beginning in 1917, he added many more papers to his list, buying as many as seven in one year (1922). He bought or established altogether more than 40 daily papers.

Though the Scripps and Hearst "chains" were the largest of such systems, there were many other groups, such as the Booth Newspapers, in Michigan, founded by George C. Booth; the Brush-Moore Newspapers, in Ohio, founded by Louis H. Brush and Roy D. Moore; the Lee Syndicate, in the upper Mississippi valley, founded by Alfred W. Lee; the Copley Press, in Illinois and California, founded by Ira C. Copley; the Speidel Newspapers, founded by Merritt C. Speidel and strung across the country from New York to California; the Frank E. Gannett Newspapers, chiefly in New York; the James M. Cox Newspapers, in Dayton and Springfield, O., Miami, Fla., and Atlanta, Ga.; Central Newspapers, founded by E. C. Pulliam, chiefly in Indiana; the H. C. Ogden Newspapers, in West Virginia; the John H. Perry Newspapers, chiefly in Florida; Stauffer Publications, Oscar Stauffer president, in Kansas, Missouri and Oklahoma; Ridder Publications, built up by the sons of Herman Ridder in New York, Minnesota and the northwest; and the Knight Newspapers, owned by John S. Knight, comprising the *Chicago Daily News,* the *Detroit Free Press,* the *Miami* (Fla.) *Herald* and the *Akron* (O.) *Beacon-Journal.*

Consolidations, like "chains," were not new in modern journalism. Ever since the consolidation of the *New-England Weekly Journal* with the *Boston Gazette* in 1741, weak papers had been absorbed by strong ones. But the large newspaper capital investments which, beginning in the 1890s, came to characterize the newspaper business of the 20th century, made the merger a recognized technique for "cleaning up" a ruinous competitive situation. Especially dangerous, it seemed to critics of the modern communications system, was the increasing number of large cities with only one newspaper ownership; by 1940 this was the case in more than one-fourth of American cities of more than 100,000 population. Moreover, the number of daily papers in the United States declined from a peak of 2,461 in 1916 to 1,744 in 1944. Slight increases marked the latter half of the 1940s, to 1,886, of which 1,490 were afternoon papers, 392 morning papers, 4 all-day papers. There were also approximately 9,700 weekly and 350 semiweekly papers.

Newspaper consolidation was dramatized about 1920 by Frank A. Munsey's activities. In 1916 Munsey bought the *New York Sun, Evening Sun* and *Press* and merged the *Press* in the *Sun.* Four years later he bought the *Herald* and its evening associate, the *Telegram,* and merged the *Sun* in the *Herald,* changing the name of the *Evening Sun* to *Sun.* His next move was to sell the *Herald* to the *Tribune* for another merger in 1924. Then he bought the *Globe,* which had been merged with the *Commercial Advertiser* in 1905, and merged it with the *Sun.* His last consolidation was that of the *Mail and Express* and the *Telegram* in 1924.

Varied Newspapers.—The *St. Louis Globe-Democrat* had been formed when J. B. McCullagh in 1875 bought the *Missouri Democrat* (founded 1852) and merged it with his *Globe* (founded 1872). The *St. Louis Star-Times* was formed in 1935 by the consolidation of the *Star* (founded 1878), which had absorbed the *Chronicle* (1905), and the *Times* (founded 1895).

The Denver *Post,* founded in 1892, was purchased three years later by Fred G. Bonfils and Harry H. Tammen and made an outstanding exemplar of the "yellow journalism" of the period. Tammen died in 1924 and Bonfils in 1933; in 1946 Palmer Hoyt became publisher, modifying the policy of the paper. Edgar Watson Howe founded the *Atchison* (Kan.) *Globe* in 1877, and made it a widely quoted paper. Another famous editor in a small Kansas city was William Allen White, who bought the *Emporia Gazette* when it was five years old in 1895 and soon achieved national fame through his editorial writings.

The *Christian Science Monitor* was established in Boston by Mrs. Mary Baker Eddy in 1908. A handsome and high-minded general newspaper, it fought "yellow journalism" and emphasized international news. The *Des Moines Register* was begun in 1856 as the *Iowa Citizen,* a Free Soil paper. From 1870 to the end of the century the *Register* was published by Coker F. Clarkson, followed by his two sons; in 1902 it absorbed the *Leader,* which had been begun as the *Iowa Star,* Des Moines's first newspaper, in 1849. The next year the combined paper was bought by Gardner Cowles, who in 1908 gave it the two-year-old *Tribune* as an evening associate. Following the retirement of Cowles, the *Register* and *Tribune* were conducted by his sons John Cowles and Gardner Cowles, Jr., who in 1935 purchased the *Minneapolis Star* and later the *Journal* and *Tribune* of that city. In 1949 the Minneapolis papers were reduced to two—the *Tribune* for morning and the *Star* for afternoon.

The *New Orleans Times-Picayune* was a combination of the two papers of that city which survived the Civil War period—the famous old *Picayune* and the *Times-Democrat* (founded

1863, 1875; merged 1881). The *States* became its evening associate in 1933. The *Item* (1877) and *Tribune* (1924) were sold in 1949 to David Stern, son of the former publisher of the *Philadelphia Record.* The *Washington* (D.C.) *Times-Herald* was formed in 1939 when Mrs. Eleanor Patterson, granddaughter of Joseph Medill, bought the two papers from Hearst. The *Herald* had been founded in 1906 by Scott C. Bone, who had been managing editor of the *Washington Post;* the *Times* (1894) had been under Munsey ownership 1901–17. Mrs. Patterson left the *Times-Herald* to seven executives of the paper on her death in 1948; but the next year they sold it to Robert R. McCormick, publisher of the *Chicago Tribune.*

The Tabloid.—The earliest American newspapers were all tabloids, if by that term only the small size of the pages is meant. The experimental Jan. 1, 1900, issue of the *New York World,* designed and edited by Alfred Harmsworth (later Viscount Northcliffe) and called by him a "tabloid newspaper" and "the newspaper of the 20th century," had the small-page size and an emphasis on condensation. Tabloid journalism had come to stand for three techniques by the 1940s: (1) the folded-in-half page size, as compared with that of the normal eight-column paper; (2) the devotion of a large proportion of the paper's space to pictures; and (3) a terse, condensed and lively presentation of the news.

Two grandsons of Joseph Medill, Robert R. McCormick and Joseph Medill Patterson, took over jointly the management of the *Chicago Tribune* in 1914. Five years later they formed a subsidiary of the Tribune company to publish the *New York Daily News* as a new morning tabloid. In 1925, when the paper had reached nearly 1,000,000 circulation—largest in the U.S.—Patterson left his executive position on the *Tribune* and until his death in 1946 devoted himself to the management of the *Daily News.*

The sensationalism of the *Daily News* in the 1920s brought it into competition with Hearst's morning *American,* and Hearst first tried out the form in Boston by "tabbing" the *Daily Advertiser* and then founded the tabloid *Daily Mirror* in New York in 1924. Three months later Bernarr Macfadden began the *Daily Graphic* in the same form. Thus began the "war of the tabs" in New York, in which the three competitors tried to outdo each other in sensationalism. The *Graphic* perished in 1932, the *Daily News* cleaned up its columns and prospered and Hearst sold the *Mirror* in 1928 (though he had to take it back later). Meanwhile, the success of the *Daily News* had tempted publishers of dailies in other cities to try the tabloid form: there were about a dozen in 1930, 50 in 1940 and 70 in 1950. Most important, besides those mentioned above, were the Chicago *Times* (1929), the Denver, Colo., *Rocky Mountain News, Los Angeles Mirror* (1908), *New York Post Home News* (1948 merger of the old *Evening Post* with the *Bronx Home News*), the *Philadelphia News* and the *Washington News.*

World Wars.—There were comparatively few U.S. correspondents abroad when World War I broke out in August 1914, and those who were rushed across found themselves hampered on all fronts by censorship. After the arrival of the American expeditionary force in 1918, several hundred U.S. newspaper, magazine and agency men covered the war in various foreign centres and on the several military fronts.

Censorship at the fronts, though often severe and stupid in the early years of the war, was somewhat more tenable after the arrival of the A.E.F. Maj. Frederick Palmer, Associated Press and magazine correspondent, wrote the section of the U.S. field service regulations dealing with war correspondents and was himself chief American censor for six months. Within the United States more than 75 papers had their mailing privileges withdrawn under the terms of the Espionage act. The German-language press declined about one-half. The Committee on Public Information, George Creel, chairman, participated in both propaganda and censorship, and presented to U.S. papers a "voluntary censorship" code.

Most famous of the many camp and field newspapers published by and for U.S. soldiers during World War I was *Stars and Stripes,* continued for 16 months from Feb. 1918.

When the United States entered World War II in Dec. 1941, there were more than 200 U.S. reporters gathering news abroad, mostly in belligerent countries. By the spring of 1943, the number had risen to 435. The U.S. war department accredited during the entire war, for longer or shorter periods, 1,186 American correspondents and news officials, representing all media, and the navy department 460 more. Besides the press associations, 30 individual newspapers and 12 magazines had their own correspondents at the war fronts. Photographers played a far larger part in war reporting than ever before. Most famous of war pictures was that of the flag raising at Iwo Jima in Feb. 1945, taken by Joseph Rosenthal of the Associated Press. Most famous of war correspondents was Ernest Taylor (Ernie) Pyle, who wrote from England, North Africa, Sicily, Italy, France and the Pacific; he was killed on Ie Jima in the Okinawa campaign. Casualties among writers, photographers and radiomen covering the war numbered 37 killed and 112 wounded, exclusive of combat correspondents. Among the best-known writers who perished were Raymond Clapper, of Scripps-Howard Newspaper alliance, and Webb Miller, of the United Press.

The U.S. Office of Censorship, with Byron Price as director, was created Dec. 19, 1941, and lasted throughout the war. It promulgated the "Code of Wartime Practices for the American Press," which formed the basis for a remarkable co-operative self-censorship. Field censorship on the war fronts varied greatly in efficiency and reasonableness. A number of home periodicals were suppressed, chiefly after convictions of publishers and editors under the Foreign Agents' Registration act. The Office of War Information, with Elmer Davis as director, was set up on June 13, 1942, and handled an immense amount of news and propaganda at home and abroad.

Thousands of army unit, camp and installation, ordnance plant and combat ship papers served the American soldiers in World War II. Of this "G.I. journalism," *Stars and Stripes* was the chief daily newspaper and *Yank* the chief magazine. The former was reborn in London in April 1942 and was later printed in many editions on various fronts. *Yank* was begun about the same time in New York, and came to have 22 editions and a circulation of about 2,500,000. Altogether there were said to be about 600 army unit papers and twice that many camp papers in the United States.

Marshall Field's Newspapers.—The New York tabloid *PM* was founded in 1940 by Ralph Ingersoll and associates as an adless daily of liberal opinions. Marshall Field III had some money in it at the start and later increased his holdings to a controlling interest. Sold in 1948, its name was changed to the *Star,* but it perished the next year. Ted O. Thackrey, former editor of the *Post* (later *Post Home News*), founded the *Daily Compass* in 1949, with the financial backing of Mrs. Anita McCormick Blaine, publishing from the *Star*'s former plant.

Marshall Field III founded the *Chicago Sun* in 1941 as a competitor for the *Tribune* in the morning field. Six years later he bought the *Times,* evening tabloid, and "tabbed" the *Sun;* in 1948 the two papers were combined as the *Sun-Times* with round-the-clock publication. In its competition with the *Tribune,* the *Sun* felt the lack of an Associated Press membership, which it did not obtain until the government had brought suit against the A.P. for violation of the Sherman Anti-Trust act. This suit, instituted in 1942, was decided in favour of the government in 1945 and caused the A.P. to amend its rules to forbid the "blackballing" of competitors.

American Newspaper Guild.—The American Newspaper guild was organized in 1933 "to preserve the vocational interests of its members and to improve the conditions under which they work by collective bargaining, and to raise the standards of journalism." First contract negotiated was with the *Philadelphia Record.* In 1936 the guild affiliated with the American Federation of Labor, and the next year with the Committee for Industrial Organization. By mid-century it had 23,000 members and had contracts in force on about 175 dailies and several independent newspapers, as well as on other periodicals and with the news-

gathering agencies. There were many strikes, some of which forced suspension of newspapers. One of the strikes, called by the International Typographical union (organized 1850) against the Chicago papers on Nov. 24, 1947, lasted 22 months. The papers resorted to "cold type" production methods, printing from plates made directly from typewritten ("varityped") copy.

Alaskan and Hawaiian Newspapers.—The first paper in what is now Alaska was *Esquimaux,* printed monthly at Port Clarence, Russian America, by John J. Harrington for the Western Union Telegraph expedition in 1866–67. The *Klondike Nugget* was published at Dawson 1898–99 by Eugene C. Allen, and was later established as a weekly at Nome. Anchorage, Juneau, Fairbanks and Ketchikan acquired small dailies, and by mid-century there were a dozen weeklies.

The first Hawaiian newspaper was the weekly *Sandwich Island Gazette and Journal of Commerce* (1836–39) by Samuel D. Mackintosh and Nelson Hall, which was continued monthly 1839–40 as the *Sandwich Island Mirror and Commercial Gazette.* Of longer life was James Jackson Jarves' *Polynesian* (1840–64). The first daily was the *Hawaiian Herald* (1866). The chief papers in Honolulu at mid-20th century were the *Star-Bulletin* and the *Advertiser.* The *Hawaiian Star* was begun in 1893 and the *Evening Bulletin* in 1882; they were merged in 1912 by Wallace R. Farrington, later governor of the territory. The *Advertiser* was founded as a weekly by Henry M. Whitney in 1856. The *Hawaii Times* was founded in 1885 and published in both English and Japanese. In Hilo, the daily *Tribune-Herald* was founded in 1895.

Appraisals of the Press.—Since the hostile criticism of the first American newspaper, *Publick Occurrences,* there has been a fairly steady stream of criticism of newspapers in books, magazines, public speech and the newspapers themselves. These criticisms, by such men as Charles Dickens, James Fenimore Cooper, Lambert A. Wilmer, David G. Croly, Edwin Lawrence Godkin, Oswald Garrison Villard, George Seldes, Silas Bent, Harold L. Ickes and Herbert Brucker, have ranged from angry invective to sober appraisal, from personal or partisan motivation to the scholarly and sociological attitude. Perhaps the most important investigation was undertaken by the Commission on Freedom of the Press headed by Robert M. Hutchins, chancellor of the University of Chicago. The report of the commission, entitled *A Free and Responsible Press* (1947), restated the principles of press freedom, emphasized dangers of mass publication and monopolistic control and made a series of recommendations some of which met with general acceptance.

GERMAN NEWSPAPERS

The beginnings of news printing in Germany have already been referred to. It appears that not only was the first western printing from movable types done in that country, but some of the earliest news pamphlets and perhaps the first regularly published newspapers were issued in Germany. At any rate, there is a file of the *Avisa Relation oder Zeitung,* published at Augsburg in 1609, and one copy of the Strasbourg *Relation,* of that year. Their intelligence came from all over Europe by means of the newsletters. In the issue for Sept. 4 the Strasbourg paper tells of the construction of a new telescope by Signor Galileo, professor of mathematics at Padua.

These papers were followed by others, such as the *Frankfurter Journal,* of Egenolph Emmel, in 1615, and the *Frankfurter Oberpostamtszeitung,* begun in 1616 and continued until 1866 under the shortened title of *Postzeitung.* In the course of the 17th century, most German cities supported newspapers for shorter or longer periods; in the 18th century, despite the rigours of local and state censorships, the press multiplied throughout the country. Notable for its correspondence from abroad was the *Hamburgischer Correspondent,* founded in 1714 under the title *Holsteinische Zeitungs-Correspondenz.* The outstanding Berlin papers in the 18th century were two named, for their owners, *Vossische Zeitung* (1705) and *Spener'sche Zeitung* (1749); the latter was renamed *Berlinische Nachrichten* and lived until 1827. The venerable *"Voss"* was sold to the Ullsteins in 1913.

19th Century.—Under Napoleon, censorship merely changed hands; the German press became pretty thoroughly Gallic and the newspapers echoes of the Parisian journals. But when Germany was liberated, the old censorship reappeared. A resolution of the diet, Sept. 20, 1819, subjected the press to police supervision. Unsuccessful attempts for redress were made at the Congress of Vienna (1814–15), and the meetings of the ministers of the Great Powers at Johannisberg (1824) and Vienna (1834) only increased the strictness of the censorship.

The greatest German newspaper in the first half of the 19th century, and a famous paper until its death during the Hitler regime, was the *Allgemeine Zeitung.* It was founded at Tübingen by Johann Friedrich Cotta, later Baron von Cottendorf, in 1798. Censorship and other causes forced it to move successively to Stuttgart, Ulm, Augsburg and Munich.

The revolutionary movements of 1830 and 1848 gave impetus to a new German journalism which, though most of the papers were short-lived, brought in a new period of press enterprise. Many small papers were established throughout Germany and Austria, nearly all of them consistently partisan. Censorship varied in different states. Those best known throughout the nation, besides the *Allgemeine Zeitung,* were the *Augsburger Zeitung* (1689) and the *Kölnische Zeitung* (1804); the Augsburg paper was especially famed for its foreign news.

Bismarck had a high respect for the power of the press and kept a firm hand on its control. The Press law under which the German newspapers operated 1874–1919 was based on *Reichgesetz über die Presse vom 7 Mai 1874,* which "guaranteed" freedom of the press but actually retained strong government controls. These tactics were continued long after Bismarck's retirement, and even during World War I the government controlled a number of important newspapers. Following that war, besides owning Wolff's Telegraphic bureau, the leading news-gathering agency, the Prussian government secretly bought the *Deutsche Allgemeine Zeitung,* a Berlin paper founded in 1921 by the Stinnes interests, and later sold it to the government of the Reich.

Under the German Republic.—Under the Weimar constitution of 1919, German newspapers enjoyed a larger degree of freedom than they had ever before known. In the years 1919–32, the *Gruppenpresse* (newspapers representing political, social and religious groups), though composed of papers of small individual circulations, maintained dominance in the country's journalism. During the 1920s, however, a *Massenpresse,* composed of large-circulation dailies designed for the masses rather than for parties or factions, grew up in Berlin and other large cities; these papers, though more objective in reporting and comment, were commonly partisan in control and thus had notable alignments with the *Gruppenpresse.*

By 1932 there were 4,700 newspapers in Germany, 70% of them dailies. More than 100 different parties or group ideologies were represented. This multitude of small newspaper organs was served by central correspondence bureaus and by *Maternwesens* which prepared printed sheets (*Vordruckzeitungen*) and stereotyped plates carrying news and partisan propaganda.

The largest paper in the period was the *Berliner Morgenpost,* claiming 600,000 in 1932. It was founded in 1898 by the "house of Ullstein," which consisted of Leopold Ullstein and his five sons. The father had entered the newspaper field by purchasing the *Berliner Zeitung* in 1877 (later called *BZ am Mittag* and credited with 190,000 circulation in 1932), and had then added the weekly

Berliner Illustrirte Nachtausgabe in 1892. Both were successful, but the *Morgenpost* was modelled on the success of August Scherl's *Lokalanzeiger,* which had been founded in 1882, and which had achieved a considerable circulation in the 1890s through a new system of individual distribution and enterprising promotion. Other Ullstein dailies were the old "quality" *Vossische Zeitung,* acquired in 1913, but never a circulation leader; and *Tempo,* an evening paper started in 1930, which had 140,000 by 1932. Other large papers in Berlin were *Der Tag* (1900), claiming 100,000 in 1932; and *Berliner Nachtausgabe* (1924), with 180,000. These, with the *Lokalanzeiger,* were Scherl papers, backed by the Hugenberg *Konzern.* Alfred Hugenberg, leader of the People's National party, controlled the large Scherl dailies, as well as the weeklies and magazines of that chain, and the Telegraph Union (second only to Wolff's). Besides the Ullstein and Hugenberg combines, *Konzentrations A.G.* controlled about 200 Social-Democratic papers and owned a news agency; Rudolph Mosse controlled the *Tageblatt, Volkszeitung* and *Morgenzeitung* in Berlin; and there were many other organizations more loosely bound together.

A number of large papers, regarded as belonging to the *Massenpresse* because they each had 100,000 circulation or more, had by 1932 grown up in other large cities besides Berlin. Such were the *Anzeiger* (1887) and *Fremdenblatt* (1828) of Hamburg; the *General Anzeiger* (1887) of Dortmund; the *General Anzeiger* (1876) of Frankfurt; the *Neueste Nachrichten* (1888) of Breslau; the *Stadtanzeiger* (1876) of Cologne; the *Neueste Nachrichten* (1893) of Dresden; the *Nachrichten* (1876) of Düsseldorf; the *Anzeiger* (1892) of Hanover; the *Neueste Nachrichten* (1892) and *Neue Zeitung* (1806) of Leipzig; and the *Nachrichten* (1848) and *Zeitung* (1892) of Munich. And yet some of the most influential papers in Germany had only about 60,000 circulation, such as *Frankfurter Zeitung* (1856), *Kölnische Zeitung* (1804), Nürnberg *Fränkische Kurier* (1833) and *Hamburger Nachrichten* (1792). This quartette of famous old papers was long powerful in Europe. Bismarck once said of *Kölnische Zeitung* that it was "worth an army corps on the Rhine." Oldest of all German papers, with only a few thousand circulation in 1932, was the *Hartungsche Zeitung* of Königsberg, founded in 1640.

The Hitler-Goebbels Press.—Adolf Hitler's first task in connection with the group which was soon to become the National Socialist party was the direction of a press and news bureau in the district army command at Munich in 1919. After the military *putsch* of March 1920, sympathizers bought a newspaper for Hitler and his associates—Dietrich Eckart, the journalist, and Alfred Rosenberg, a young Russian refugee—to use in their propaganda for the new movement. This paper was the *Völkischer Beobachter,* which had been founded some years before World War I as a weekly gossip sheet. As the nazi influence expanded in the 1920s, its newspaper effort broadened; but the *Beobachter* remained Hitler's personal organ, and for the elections of 1932 he established a Berlin edition. In connection with those elections, also, Hitler's party established or acquired about 130 other newspapers distributed strategically throughout Germany, placing them under the direction of trusted subordinates.

When Hitler became chancellor in Jan. 1933, he immediately caused Pres. Paul von Hindenburg to invoke article 48 of the constitution in order to cancel the guarantee of freedom of the press. Some papers were stopped at once, and the press in general was muzzled. Within three months 200 papers had been suspended; within a year 600 had been killed, the Deutsche Nachrichtenburo (DNB) had been set up to supersede Wolff's Telegraphic bureau, and a journalists' registration system had been devised which made newspaper men "semi-official public functionaries." Max Amman, publisher of the *Völkischer Beobachter,* became president of the Reich Press chamber, a division of Josef Goebbels' ministry of public enlightenment and propaganda. Goebbels had founded the newspaper *Der Angriff* in 1927 and two years later became head of nazi propaganda activities. Amman's duties were largely on the business side, though he shared with Otto Dietrich the veto on new papers. Dietrich was Reich press chief and had charge of editorial policies and personnel. Eher Verlag was set up to handle nazi printing and publishing; operating chiefly in Berlin and Munich, it soon became the largest publishing concern in the world. It published the *Beobachter, Angriff, Schwartze Korps* (S.S. organ), *Arbeitsmann, Hitlerjugend* and other official newspapers and periodicals, as well as books, pamphlets, posters, etc.

Jewish newspaper owners—the Ullsteins, Mosse, etc.—were driven out. When Germany seized Austria in 1938, many of the old papers (including *Wiener Zeitung,* founded in 1703) disappeared, and the remainder of the Vienna papers were combined in one nazi organ. The number of newspapers in Germany was reduced from 4,700 in 1932 to about 2,000, and the press became, to use Goebbels' famous figure, an organ on which the minister of propaganda could play his own tunes.

The Occupation Press.—World War II annihilated the German press. New papers were licensed by the occupation powers in their various zones. The Soviet military government established *Tägliche Rundschau* in Berlin; the U.S. military government set up *Die Neue Zeitung* in Munich, designed as a model democratic newspaper; the British founded *Die Welt* in Hamburg; the French licensed *Der Kurier,* an afternoon Berlin paper. By mid-century there were 20 dailies in Berlin, of which the Soviet *Rundschau* had the largest circulation, said to be 800,000; while the British-licensed *Telegraf* and the U.S.-licensed *Tagesspiegel* each had around 500,000. The U.S. semiweekly *Neue Zeitung* was circulating more than 1,300,000 copies of each issue, including Berlin and Frankfurt editions; and the British triweekly *Die Welt* 700,000, also including a Berlin edition. Most papers outside Berlin were published only two or three times a week.

G. Rahm, *"Der Angriff"* (Berlin, 1939).

FRENCH NEWSPAPERS

The French newspaper press from the first was characterized by a literary quality generally superior to that of the press of most other countries, by special attention to the arts and by alliances (sometimes amounting to subsidization) with political, social or literary groups. Parisian journalism frequently became a path to fame in both politics and literature.

Beginnings.—The first French newspaper was the *Gazette* (afterward called the *Gazette de France*), established in 1631 under the patronage and with the active co-operation of Cardinal Richelieu. The first editor and printer was Théophraste Renaudot The first weekly number apparently appeared in May 1631. So much, at least, may be inferred from the date (July 4, 1631) of the sixth number, which was the first dated publication. Each number of the paper, which cost six centimes, consisted of a single sheet (eight pages) in small quarto, and was divided into two parts—the first simply entitled *Gazette,* the second *Nouvelles ordinaires de divers endroits.* It commonly began with foreign and ended with home news. Much of its earliest foreign news came direct from the minister, and not seldom in his own hand. Louis XIII took a keen interest in the progress of the infant *Gazette,* and was a frequent contributor, now and then taking his little paragraphs to the printing office himself, and seeing them put into type. In Oct. 1631 Renaudot obtained letters patent to himself and his heirs, conferring the exclusive privilege of printing and selling, where and how they might please, "the gazettes, news and narratives of all that has passed or may pass within and without the kingdom." At his death in Oct. 1653 Renaudot left the *Gazette* to his sons in flourishing circumstances. Its place was later filled by the *Journal Officiel.*

In 1672 the *Mercure galant* was established by Donneau de Vizé. Its title was later changed to *Nouveau Mercure,* and in 1728 to *Mercure de France,* a designation retained, with slight modification, until 1853, when the paper finally ceased. It had

many prominent contributors. In 1790 its circulation rose very rapidly and reached for a time 13,000 copies. Mirabeau styled it in debate "the most able of the newspapers." Great pains were taken in the collection of statistics and state papers, the absence of which from the French newspaper press had helped to depress its credit as compared with the political journalism of England and to some extent of Germany.

Under Napoleon the organ of official information was the *Moniteur* (*Gazette nationale, ou le moniteur universel*), founded in 1789 under the same general management with the *Mercure*. The *Moniteur* kept step with the majority of the assembly, the *Mercure* with the minority. So marked a contrast between two journals with one proprietor gave too favourable a leverage to the republican wits not to be turned to good account. Camille Desmoulins depicted him as Janus—one face radiant at the blessings of coming liberty, the other plunged in grief for the epoch that was rapidly disappearing.

The only other newspaper of a date anterior to the Revolution which need be noticed here is the first French daily, the *Journal de Paris*, which was started on New Year's day of 1777 and lived till 1819. Its period of highest prosperity may be dated about 1792, when its circulation is said to have exceeded 20,000. The *Journal des débats* was founded in 1789 by François-Jean Baudouin.

19th Century.—The cheap journalism of Paris began in 1836 with the journal of Emile de Girardin, *La Presse*, and *Le Siècle*, under the management of Dutacq, to whom, it is said—not incredibly—the original idea was really due. The first-named journal attained a circulation of 10,000 copies within three months of its commencement and soon doubled that number. The *Siècle* prospered even more strikingly, and in a few years had reached a circulation (then without precedent in France) of 38,000 copies.

The rapid growth of the newspaper press of Paris under Louis Philippe will be best appreciated from the fact that, while in 1828 the number of stamps issued was 28,000,000, in 1836, 1843, 1845 and 1846 the figures were 42,000,000, 61,000,000, 65,000,000 and 79,000,000, respectively. At the last-mentioned date the papers with a circulation of around 10,000 were (besides the *Moniteur*, of which the circulation was chiefly official and gratuitous) as follows: *Le Siècle*, 31,000; *La Presse* and *Le Constitutionnel*, between 20,000 and 25,000; *Journal des débats* and *L'Epoque*, 10,000 to 15,000.

The impulse given to the growth of advertisements in the days which followed July 1830 became, as the years rolled on, sufficiently developed to induce the formation of a company—in which one of the Laffittes took part—to farm them, or rather to farm a certain conspicuous page of each newspaper, at a yearly rent of £12,000 sterling (300,000 francs), so far (at first) as regarded the four leading journals (*Débats, Constitutionnel, Siècle, Presse*), to which were afterward added two others (*Le Pays* and *La Patrie*). The combination greatly embarrassed advertisers, first, since its great aim was to force them either to advertise in all, whether addressing the classes to be canvassed or not, or else to pay for each advertisement in a selected newspaper the price of many proffered advertisements in all the papers collectively, and, secondly, because by many repetitions in certain newspapers no additional publicity was really gained, two or three of the favoured journals circulating mostly among the same class of buyers.

On July 16, 1850, the assembly passed what is called the "*loi* Tinguy" (from the name of the otherwise obscure deputy who proposed it), by which the author of every newspaper article on any subject, political, philosophical or religious, was bound to affix his name to it, on penalty of a fine of 500 francs for the first offense, and of 1,000 francs for its repetition. Every false or feigned signature was to be punished by a fine of 1,000 francs, "together with six months' imprisonment, both for the author and the editor." The practical working of this law lay in the creation of a new functionary in the more important newspaper offices, who was called *secrétaire de la rédaction*, and was, in fact, the scapegoat ex officio. The "*loi* Tinguy" had a permanent influence on French journalism in the continued prevalence of signed articles, and the consequent prominence of individual writers as compared with the same class of work in other countries.

In 1858 the order of the six leading Parisian papers in point of circulation was: (1) *Siècle*, (2) *Presse*, (3) *Constitutionnel*, (4) *Patrie*, (5) *Débats* and (6) *Assemblée*. The number of provincial papers exceeded 500. In 1872 the circulation of *Le Petit journal* (founded 1863), the pioneer of the French halfpenny press, was 212,500, and it went on rapidly increasing. In 1874 an elaborate return showed that in the 35 principal towns of France, comprising a population of 2,566,000, their respective journals had an aggregate weekly issue of 2,800,000 copies. In 1878 the total number of journals of all kinds published in France was 2,200. At that date *Le Figaro* had a circulation of about 70,000, *Le Petit journal* about 650,000. Moïse-Polydore Millaud, creator of the "journal à un sou," made a fortune from *Le Petit journal* and introduced a new era of cheap papers.

The newspapers of Paris, and similarly of France, practically doubled in number between 1880 and 1900. In 1880 there were about 120 Paris newspapers, in 1890 about 160 and in 1900 about 240. The total number of newspapers, as distinguished from periodicals, published in France during 1900 was in round numbers 2,400, of which about 2,160 appeared in 540 provincial towns.

The history of the French press during the last 20 years of the 19th century followed very closely that of the country itself, Boulangist and anti-Boulangist, Dreyfusist or anti-Dreyfusist, Republican or Nationalist; finally it became either Moderate Republican or Radical Socialist, with a sprinkling of Nationalist organs and a small minority of Royalist and Bonapartist sheets.

The French papers, of whatever party, took an increased interest during this period in foreign matters and much improved their organization for collecting news. *L'Eclair* gave less attention to the discussion of political questions from the party point of view than to the collection of news, and was followed by the *Echo de Paris* (1884) and *Le Matin*, which also dated from 1884, and which by an arrangement with the *Times* of London gave every day a translation of most of the telegrams published in that newspaper. The *journal d'information*, as these papers were called, took its place beside the journal properly so-called, more perhaps as a rival than as a complement. The natural result followed, and the more old-type newspapers took steps to provide their readers with news as well as with leading articles, current and literary topics, society gossip, dramatic criticism and law reports. Nothing perhaps was so striking after 1890 as the demand of the French public for foreign and colonial news, or the readiness of the papers to supply it by means of special representatives independent of the news agencies. An enlargement of the individual newspapers followed, accompanied by a reduction of price.

In home matters the French press made greater progress still in the rapid and accurate collection of news, and in this respect the provincial press showed more enterprise and more ability than that of Paris. Its development was remarkable, for whereas in 1880 the inhabitants of the departments had to await the arrival of the Parisian papers for their news, they now had the advantage of being supplied every morning with local newspapers inferior to none of the best organs of Paris. Among the best provincial papers may be mentioned *La Petite Gironde* (1872) of Bordeaux, *La Dépêche* (1870) of Toulouse, *Le Lyon républicain* (1878), *L'Echo du nord* (1819) of Lille and *Le Journal de Rouen* (1762), all of which had Paris staffs reporting parliamentary proceedings and law cases, telegraphed or telephoned during the night and published early the next morning in their respective localities. Being perfectly independent of purely Parisian opinion or even bias, the decentralization of the French provincial press became complete; it became also more independent politically than the Paris press. Several journals had national reputations: *La Dépêche* of Toulouse, with its 12 editions daily, *Le Progrès* of Lyons, *Le Petit marseillais* and *La Petite Gironde* of Bordeaux.

20th Century.—During World War I, French newspapers were under severe censorship, becoming more than ever servants of the government. Many disappeared for a time because of shortage of paper or manpower. Changes in the French press as a whole were temporary, and prosperity returned after the war.

In 1930 Paris had 23 morning dailies of general circulation, and ten afternoons, while there were 140 dailies in the provinces. Certain Paris papers had reached the 1,000,000-circulation class, thus leading the world, though soon to be followed into this bracket by Tokyo, Jap., and London dailies. Circulation of *Le Petit parisien,* founded in 1876 by Andrieux and Jules Roche, reached 1,000,000 in 1904; stimulated by its use of U.S. news methods, it distributed 1,700,000 copies daily by 1930. Next was *Le Journal* (1892) with 1,200,000, and third was *Le Matin* (1884), just at the 1,000,000 mark. Characteristic of the popular press were two serial stories, or *feuilletons,* in each issue; front-page opinion articles, signed by well-known contributing editors; and modest sizes of four to ten pages. Every phase of politics was represented, from Legitimist to Communist. The better-known political papers were *Le Temps* (1861), the venerable *Journal des débats* (1789), *La Liberté* (1864), *L'Oeuvre* (1893) and the Communist *L'Humanité* (1904).

One of the best-written and best-printed papers was *Le Figaro,* which had first appeared in 1826 and after an unstable and obscure early life had been made a leading journal by J. H. A. Cartier de Villemessant in the mid-19th century. *Le Figaro* was later directed by Francis Magnard, and in 1924 was bought by François Coty, famous manufacturer of perfumes, who became a successful journalist.

World War II.—It was clear that when Germany's blitzkrieg overwhelmed France in June 1940 the press bore no small part of the responsibility for the debacle. Misrepresentation of foreign affairs and of national preparedness were largely the result of government censorship, but submission to government policy and active propaganda for nazi and fascist doctrines were sometimes the result of bribery, according to the famous French journalist André Géraud ("Pertinax").

The 25 Paris dailies of general circulation were reduced during the German occupation to half a dozen: *Le Matin,* which was suspended only a few days when the Germans marched in, and then offered itself to the conquerors; *L'Oeuvre,* at this time in the hands of Marcel Déat, one of the nation's leading collaborationists; *Le Petit parisien,* which at first fled the city (as did other papers, such as *L'Oeuvre, Le Journal, Le Figaro* and *Le Temps*) but obeyed German orders to return; *Le Temps,* which the Germans brought back to Paris and rechristened *Les Nouveaux temps;* the newer *Paris midi;* and *Le Cri du peuple,* edited by the turncoat Jacques Doriot. Not all these were published during the entire occupation period, and they were supplemented by several short-lived newcomers.

Meantime, an irregular underground press opposing both the Germans and their collaborationists grew up not only in the southern zone, where the press operated under the information ministry, but also in the northern zone, where the papers were more strictly controlled by nazi directives. Among leading underground papers were *Le Franc-Tireur, Combat, Résistance, Libération* and *Défense de la France.* Some papers were no more than mimeographed sheets, and some were even copied by hand; it was not uncommon for a line to be appended to one of these papers saying, "Make 20 copies and distribute among friends." Editorial and mechanical staffs were sometimes caught and executed; *Résistance* ended after about a year because its staff was shot by the Germans.

Liberation.—When France was liberated in 1944, the only prearmistice papers allowed to resume were four which had refused collaboration—*L'Humanité, Le Populaire, Le Figaro* and *L'Aube.* The various resistance groups which had published outlaw papers during the occupation now had dailies to represent them in the Paris press, and all those named in the preceding paragraph became competitors for popular favour. Despite the paper shortage that limited each paper to two pages and kept circulations down to prescribed quotas, there was a great demand among French readers, resulting in a boom in the newspaper business and the establishment of more than a score of new dailies in Paris during the first year of the liberation. In July 1946 the size of the Paris papers increased to four pages. But two years later circulations had dropped, advertising had fallen off and costs had advanced alarmingly.

By mid-century more than half the 34 general dailies published in Paris shortly after the liberation had disappeared. Foremost among survivors was *France-Soir,* originally published as the underground *Défense de la France,* which used U.S. techniques in headlines, objective news, accent on crime and fresh feature material. It led Paris circulations, with about 700,000, and had several weekly and monthly periodicals which were equally successful. *Paris-Presse-Intransigeant,* representing a survival of the famous liberal *Intransigeant* founded in 1880; the Catholic *Figaro,* with its high literary standards; and *Le Parisien libéré,* favourite of the *petit bourgoisie,* were next in circulation.

Havas.—The Havas News Agency, founded by Charles Havas in 1835, achieved a virtual monopoly of foreign news by furnishing the most economical method for newspapers of the period to obtain such news and by cultivating close relations with government. Auguste Havas, Charles's son, took over l'Agence Havas in 1850 and six years later added an advertising agency, exchanging his news for advertising space. M. Lebey succeeded Auguste Havas as manager in 1873, adding a feature service and furnishing stereotyped plates to provincial papers. Baron d'Erlanger acquired Havas in 1879 and incorporated it with 8,500,000 francs' capitalization. The agency gained in power during the ensuing 40 years, and in the 1920s absorbed several other agencies, including Agence Radio.

For three-quarters of a century preceding World War II, Havas handled a very large proportion of French advertising, including *publicité d'influence* for government and finance. It handled large sums for the French government and also for certain foreign powers; thus it became, with its dominant news service, what Pertinax called the "hub" of French press corruption. In 1940 the Vichy government, having taken over the entire Havas business, divided the news and advertising services. The former was called Office Français d'Information; the latter, under the old name, became solely an advertising agency and continued after the liberation.

During the occupation, the Free French set up the Agence Française Indépendant, with headquarters in London, supported by Allied funds. After the liberation, this became Agence France-Presse.

Provincial and English-Language Dailies.—The number of provincial dailies at the mid-20th century was almost as great as before World War II—somewhat fewer than 200—while the number of provincial weeklies, semiweeklies and triweeklies exceeded 1,000. The largest provincial dailies were: *Ouest-France,* Rennes; *Le Sud-Ouest,* Bordeaux; *Le Progrès,* Lyon; *La Voix du nord,* Lille; *La Nouvelle république du centre-ouest,* Tours; *Les Allobroges,* Grenoble; and *L'Est républicain,* Nancy.

English-language journalism in Paris began with Sampson Perry's *Argus* (1809), a Napoleonic organ. This was followed by the more important *Galignani's Messenger* (1814–1904). In 1887 James Gordon Bennett, Jr., founded in Paris the European edition of his *New York Herald,* which became the leading English-language paper on the continent. The *Herald* absorbed the European edition of the *Chicago Tribune* (1917–35) and in 1935 changed its name to *Herald Tribune* to conform with the title of the parent paper in New York. The continental edition of the *London Daily Mail* was founded in 1905. The *Daily Mail* and *Herald Tribune* suspended their Paris editions during the German occupation. The *New York Post* had a Paris edition 1945–46.

OTHER EUROPEAN NEWSPAPERS

Italy.—The name "gazette," which was for so long a more common generic designation of printed sheets or pamphlets of news than "newspaper," is believed to have been derived from *gazzetta,* a small coin used in Venice in the 16th century, which

may have been the price of early *fogli d'avvisi* or the admission to a group which listened to the reading of such newssheets. Venice was a chief centre for the written newsletters of the middle ages, and weekly printed newssheets appeared in Florence as early as 1636, the work of Amador Massi and Lorenz Landi. The first Italian paper with a continuous title appears to have been *Sincero,* published in Genoa in 1645.

The press of Italy, always subject to more or less severe government controls, lent itself to reform and even revolutionary movements. Giuseppi Mazzini was an active journalist; and Count Cavour's *Il Risorgimento,* which he founded with Count Cesare Balbo in 1847, was the great organ of the national movement. The constitution of 1848 declared for freedom of the press; yet "special laws," it stated, would "punish abuses." Accordingly, a set of press edicts was issued which retained effective political controls and remained in use until the sterner censorship of the fascist regime.

In 1920, according to *Annuario della stampa italiana,* there were 157 daily papers and 843 weeklies in Italy. Following Benito Mussolini's march on Rome in 1922, the national press regulations were adapted to the pattern of a totalitarian state, with very definite editorial policies prescribed for them almost day by day. Opposition papers were suppressed and their editors disposed of. Mussolini himself had been a journalist, editing the Socialist *Avanti* of Milan in 1912–14, and resigning that position to found his own *Il Popolo d'Italia,* which he edited until 1922. Under his dictatorship, Italian dailies were reduced to 50 or 60.

Much the oldest of the survivors was the *Gazzetta di Venezia,* which had been founded by Anton Piazza in 1787 under the name *Gazzetta urbana veneta,* changing title in 1814. In the hands of Gino Damerini it became in 1922 the strong fascist journal of Venice. *L'Osservatore romano* was founded as the papal organ in Rome in 1861.

The Agenzia Stefani was set up by Count Cavour in 1853 under the management of Wilhelm Stefani. It functioned as a government news agency in Rome under all changes and through the fascist era.

World War II put an end to many of the older newspapers, but peace brought forward many new ventures and in 1948 there were 119 dailies being published and about 700 weeklies. The *Corriere della séra* (1876) of Milan had a circulation of 450,000—the largest in Italy. Despite its name, it continued to be a morning paper; its evening associate, *Corriere d'informazione,* had 250,000 circulation. Half a dozen other papers claimed about 200,000, but only 20 Italian dailies had as many as 100,000. Two foreign-language dailies were published—the *Rome Daily American* and the German *Dolomiten* at Bolzano.

Spain.—The history of the Spanish press is chiefly a history of censorships, with intermittent eras of relative freedom. The first authorized papers appeared only after the declaration for liberty of printing by the *cortes* of Cadiz on Nov. 10, 1810; this was withdrawn in 1814, re-established in 1820 and then annulled 1823–34. The periods of authorized publication were too short to permit the development of important newspapers; their place was taken by such reviews as Bretón de los Herreros' *Correo literario y mercantil.* Exceptions to the short-lived nature of the newspapers before the constitution of 1869 were the government bulletin *La Gaceta de Madrid* (1661), begun as a monthly, later published weekly and made a daily in 1890; and *Diario de Barcelona* (1792), which, as the leading and semiofficial paper of Catalonia, was independent of the Spanish censorships. Spanish papers were generally political, often in revolt against the censorships and inadequately financed.

The civil war of 1936–39 reduced daily papers in Spain from about 250 to fewer than 100. In 1939, 39 republican editors were shot, and the remaining papers were thus effectively brought into line. Control of the press at mid-century was somewhat less strict than during the war, though the old system of the *"editores responsables"* approved by government, first set up in 1833 at the outbreak of the Carlist uprisings, was again in use, and the ministry of education exerted a precensorship and a control over newsprint.

The largest paper in Madrid in 1950 was *A.B.C.,* founded in 1904 by Don Torcuato de Tena as a monarchist journal. By the use of pictures and shrewd management, the paper became the most prosperous in the history of Spanish journalism, occupying a new printing establishment and obtaining a circulation of 225,000. During the civil war it was in republican hands, but the founder's son, Don Juan Ignacio Luca de Tena, published a monarchist *A.B.C.* in Seville. After the peace, the paper was forced into line by a refusal of paper quota and temporary suspension.

Agencia Telegráfica Fabra, the Spanish news service, was founded by Nilo Fabra in 1865 as Centro de Correspondencia.

The Balearic Islands and the Canaries, Spanish dependencies, each maintained five daily newspapers at mid-20th century.

Portugal.—Successive governments of Portugal allowed scant and temporary liberty of the press. The constitutional provisions of 1911, separating church and state, provided for press freedom, but the dictatorship which developed under the constitution of 1933 was unfriendly to independence of the press.

Thus no great newspapers have developed in this country. In 1950 there were ten dailies in Lisbon, three in Oporto, two each in Braga and Evora and one each in Beja and Coimbra. About 30 weeklies, semiweeklies and triweeklies were published in the country. There were four dailies in the Azores and five in Madeira. Angola (Portuguese West Africa) also had two dailies published in São Paulo de Luanda, and one in Benguela.

Largest of Portugese papers were *Diario de noticias* (1864) and *O Seculo* (1880), Lisbon morning papers each claiming 100,000 circulation.

Belgium.—Some of the earliest newssheets in Europe were printed in Belgium. It has been claimed that Abraham Verhoeven's newssheets, authorized for publication as *"Nieuwe Tydingen"* in Antwerp in 1605, constitute the first occidental newspaper, though the earliest extant copy is one for 1621. Newspapers were, of course, under the control of the various national authorities which ruled what is now Belgium over the long period before the constitution of 1831. That document declared for freedom of the press, and under such liberal provisions Belgium developed vigorous newspapers despite the competition afforded by the French press and the hardships suffered in two world wars.

In 1831 the 10 dailies in the country were all printed in French, and as late as 1848 there were 38 dailies, all in that language. But by 1860 there were 9 Flemish dailies, and by mid-20th century nearly one-third of the 60 dailies were published in that tongue. Most of the large Belgian papers had Sunday editions, and some published weekly illustrated supplements.

The largest papers were issued in Brussels: *Le Soir* (1887), with somewhat less than 300,000; *Het Laatste Nieuws* (1886), with 240,000; *La Dernière heure* (1906), with 225,000; and *La Libre belgique,* founded in 1885 as *La Patriote,* but taking the latter name when it went underground during the German occupation in World War I, with 140,000. The largest Antwerp paper was the *Gazet van Antwerpen* (1891), with 130,000. *Le Peuple* (1885), famous Social Democratic paper with which Emile Vandervelde was associated, perished during World War II.

The Netherlands.—Dutch printers were among the first Europeans to exercise the art, and such early printers as George Veseler, Broer Jonson and Adrian Clarke issued some of the corantos which were the forerunners of regularly published newspapers. Some such papers appeared in Amsterdam before 1620. In 1656 was founded what by 1950 was the oldest paper published in the Netherlands, the *Oprechte Haarlemsche Courant,* which became a daily in 1847.

The *Algemeen Handelsblad,* founded in 1828 as *Nieuwe Amsterdamse Courant,* was the first daily in the country. The largest circulation by 1950 was the 320,000 of *Het Vrije Volk,* a Socialist paper with editions in Amsterdam, Rotterdam, Groningen and Arnhem. The independent *Het Parool* and the antirevolutionary *Trouw,* which began as underground sheets during the German occupation, came next, with more than 200,000 circula-

tion each. As in France, collaborationist papers were suspended at the time of the liberation. *De Telegraaf,* founded in 1893 by H. M. C. Holdert, was suspended but allowed to resume in 1949. Holdert, who died in 1944, had made *De Telegraaf* a great and profitable paper.

Most famous paper outside Amsterdam was the *Nieuwe Rotterdamse Courant* (1843), founded and conducted by the Nijgh family. Other important papers were published in The Hague, Utrecht, Haarlem, etc.

The news agency, Algemeen Nederlandsch Persburo, was founded in 1935.

Denmark and Iceland.—Though various Danish newspaper efforts followed the "king's law" of 1665, government controls in this country were stern until the more liberal "June constitution" of 1849.

In 1749 Ernst Heinrich Berling, German-born book publisher began publication of the *Kobenhavske Post-Tidener* (*Copenhagen Post-News*). The name was changed several times, finally becoming *Berlingske Tidende.* It became a daily in 1841; three years later a morning edition was established, to become the major Berling paper, with *Berlingske Aftenavis* as the evening edition. The paper lost its position as government organ in 1901, but the Berling concern was enlarged by the addition of *B.T.,* a tabloid daily established in 1916, weekly and monthly magazines, etc. *Berlingske Tidende* was the largest Danish paper in 1950, with about 200,000 circulation.

Another daily founded in the 18th century and still published in 1950 was the *Stiftstidende* (1794) of Aarhus. Second largest Danish paper was the leftist Liberal *Politiken* (1884); *Ekstrabladet* was its evening associate. *Information* grew out of the Danish underground press during the German occupation.

Iceland had monthly periodicals as early as 1773. A weekly, *Thjodolfur,* was begun in 1848; and the first daily was *Dagskra* (1896). The oldest and largest paper in the island at mid-20th century was *Visir* (1910).

Norway.—The Norwegian press apparently began with the founding of the *Norske intelligenssedler* in Oslo in 1763, and two years later the *Efterretninger fra Addressecontoiret* in Bergen. The latter was a mercantile and labour bulletin which preceded the partisan political press that eventually came to be characteristic of Norway.

Shortly after the union with Sweden in 1814, a number of political papers were begun in Oslo, of which the *Morgenbladet,* still published at mid-20th century as a Conservative daily, became the best known both in and out of Norway.

Sweden.—Though a newssheet called *Hermes gothicus* is known to have been published as early as 1624 in Strängnäs, and similar corantos were published in other Swedish towns, the first paper published with regularity appears to have been the *Ordinari post tijdender,* begun in 1645 and, at mid-20th century, the oldest continuously published newspaper in the world, though little more than an official bulletin, under the title *Post och inrikes tidningar.* Its founder was Johan Beijer, Sweden's second postmaster general. It became a daily in 1820.

The oldest independent newspaper in Sweden in 1950 was the *Tidningar,* founded at Norrköping in 1758.

The *Handels- och sjöfarts-tidning* (1832) (*Trade and Shipping News*) of Göteborg maintained a liberal and democratic tradition.

The largest circulations at mid-20th century were those of three Stockholm papers, in the following order: *Stockholms-tidningen* (1824); *Aftonbladet* (1830), afternoon associate of the preceding paper; and *Dagens Nyheter* (1864). The last-named paper also owned the evening *Expressen* (1944). Tidningarnas Telegrambyra, the national co-operative news agency, was founded in 1867.

Finland.—The first newspaper in Finland was published in the Swedish language in 1771, and the first in Finnish appeared in 1776. The oldest paper still published at mid-20th century was the *Abo Underrättelser* (1824), of Turku, while the oldest in Helsinki, the capital, was *Uusi Suomi* (1847). Largest of the dailies was the *Helsigin Sanomat* (1889), with 150,000 circulation.

Poland.—The origins of the Polish press go back to 1661, when Johan Aleksander Gorczyn published his *Merkurjusz Polski.* The political history of Poland, however, made it difficult for newspapers to exist for long periods; an exception was the *Kurier Warszawski* (1820–1938).

World War II destroyed the Polish press, and only two of the prewar papers survived in the postwar period—*Robotnik* (1896) and *Polska Zbrojna* (1921), the Polish army paper. About 50 dailies were published in Poland in the late 1940s, a dozen of them in Warsaw. The largest daily was in Katowice, where the *Trybuna Robotnica* claimed 300,000 circulation. Second was Warsaw's *Express Wieczorny,* with 200,000.

Merger of the Communist and Socialist parties in 1949 reduced the number of papers.

Lithuania, Latvia, Estonia.—After the rebellion of 1863, all printing in Lithuanian was banned by the Russian rulers, though papers published in that language by refugees in near-by countries were secretly circulated in Lithuania. Examples were *Ausra* (*Dawn*), established in 1883 by the patriot leader Jonas Basanavicius; *Szviesa* (*Light*); and *Varpas* (*Bell*), published irregularly 1889–1904. Following the revolution of 1905, a national press was established which, by 1939, included considerably more than 100 periodicals in 17 languages. The official organ of the government, and the leading newspaper, was *Lietuvos Aidas* (*Lithuanian Echo*), which was begun at Vilnius in 1917.

The earliest Latvian newspaper was K. F. Watson's *Latweechu Awihaes* (*Latvian Gazette*), of Mitau, in 1822. Many papers were published in the 19th century, and the first daily appeared in Riga in 1877—*Rigas Lapa.* Following the establishment of the republic in 1918, a considerable number were founded, and by 1939 there were 15 dailies and about 200 other periodicals. Leaders of the Lettish press were *Briva Zeme* (1919), *Jaunakas Zinas* (1911) and *Rits* (1934); and there were also important dailies in German and Russian.

There were Estonian newssheets as early as the 17th century, but the modern press of that country may be said to have begun with J. W. Jannsen's *Perno Postimees,* begun in 1857 and continued until World War II. Estonia's most important period of journalistic development was in 1918–39; by the latter year the country had 15 dailies, 12 of them in the Estonian language, and 115 weeklies, semiweeklies and triweeklies. Leaders, besides *Postimees,* were three Tallinn papers—*Paevaleht* (1905), *Rahvaleht* (1927) and *Uus Eesti* (1934).

After the Russian occupation of these three states in 1939, their papers were adapted to the pattern of the soviet press.

Switzerland.—Newssheets known as *Ordinari Wochenzeitung,* published at Basel in 1610, have been cited as constituting a newspaper and thus the beginning of the history of the Swiss press. Political and religious struggles, however, allowed little opportunity for the development of a regular journalism until the "period of regeneration," which began about 1830 and was followed by the federation of 1848. The federal constitution provided for liberty of the press and, except for short periods during World Wars I and II, there was no administrative control of the press after 1848.

Of the 400 papers at mid-20th century, 68.5% were printed in German, 26% in French, 4.5% in Italian and 1% in Rumanian. The largest circulation was that of the *Tages Anzeiger* (1893) in Zurich, with 120,000 daily; all other papers had less than 100,000 circulation.

Austria.—At least three weekly newssheets are known to have existed in Vienna before 1620. Though limited in its development by the usual censorships of the 17th and 18th centuries, the Viennese press gained a wide reputation for good writing and criticism. The reign of Joseph II (1780–90) brought a helpful liberality in newspaper licensing, but the following reign and the rule of Metternich were less favourable. The revolutionary disturbances of 1848 brought a new severity into censorship and reduced the 200 papers then published in Austria-Hungary (90 of them dailies) by about half. Not until 1867 was there a relatively free press. Two newspapers which

The new tydings out of Italie are not yet com.

Out of Weenen, the 5 November.

THe French Ambaſſadour hath cauſed the Earle of Dampier to be buried ſtately at Preſburg In the meane while hath Bethlem Gabor cited all the Hungeriſh States , to com together at Preſburg the 5 of this preſent , to diſcourſe aboute the Crovvning & other cauſes concerning the ſame Kingdom

The Hungarians continue vvith roveing againſt theſe Lands. In like manner thoſe of Moravia , vvhich are fallen uppon the Coſackes yeſter night by Holleyn, ſet them on fire , and ſlaine many dead , the reſt vvill revenge the ſame

Heere is certaine nevves com , that the Crabats , as alſo the Lord Budean , are fallen unto Betlem Gabor.

The Emperour ſends the Earle of Altheim as Ambaſſadour to Crackovv in Polen, to appeare upon the ſame meeting-day.

Novv comes tidings, that Betlem Gabor is at Thurna, there doe gather to gether great ſtore of States.

The Emper Maj. hath appoynted heere a meeting-day upon the 1. of Decemb thereupon ſhould appeare the 4 Proclaimed States. The appoynted taxing ſhall bring up a great ſom of money.

Out of Prage, the 5 of November.

Three dayes agone are paſſed by, 2 mile from this Cittie 6000 Hungarians (choſen out Soldiers) under the General Rediſerens, vvhich are gon to our Head-camp, & the Enimie lieth yet near unto ours by Rackonits , though the crie goeth, that the enimie cauſed all his might to com togither, to com this vvayes againſt Prage, if that comes to paſſe, it ſhall not run of vvithout blovves, the vvhich might be revealed vvith in fevv dayes.

It coutinues, that in the Satſer Crais are gathered togither 10000 Contrie-men, moſt high-dutch-men againſt Meiſſen, & no Bohemians, they vvill help the King to drive the enimie out of the Land In like manner ſom certaine 1000 Contrie-men rebel in the LeutmaritſcherCrais, but it is feared that thoſe Countrie-men are ſtarred up , through practiſe of the Adverſarie , that the enimie in the meane vvhile might com to Prage Wee underſtand, that Bucquoy hath not been in the Camp but by the Duke of Saxen ſom certaine dayes , therefore vve are to looke to our ſelves, for feare of Tre herie. And it is thought that the Emperour vvill leave Auſtria to the Hungorians, & ſee to effect his intention only uppon Praghe

Out of Ceul.n, the 21. Novemb.

Writing from Marpurg in Heſſen , that the Earle of the ſame Land doth cauſe the foreſaid Cittie to be ſtrongly fortified , there on doe vvorke many 100 men dayly , and there is muſtered in the Earleſhip Zigenheym not long ſince 1. Governement of foote-men , & 6 Cornets of horſe-men , the foote-men are ſent to Marpurg & Ryntels But the horſe-men are lodged in the Villages about the Cittie , & thereafter are alſo muſtered the Duke of Saxen Lauvvenburgs Governement in Tries-Zigenheym, novv further vvhere they ſhallbe laid & uſed, is yet unknovvn The ſames Brothers Governement, there quarter is laid by Caſſel , the Souldiers vvhich are taken on about Hamburg, Lubeck, in the Dukeſhip of Holſteen , & Meckelenburg, ſhould alſo be muſtered about Caſſel , & be uſed vvhere neede ſhall require

Since the laſt vve cannot enquire, that there is any thing of any importaunce paſſed betvvixt the Marquis Spinola & the Vnited Princes We underſtand that the foreſaid Spinola vvil lay his Souldiers in Garniſſon vvith the firſt , & deale them unto divers places, on part to Oppenheym, Altzey, Ingelheym & Cruitſnach, the other part at Summeren & Bacharacht , the ſpeech goeth that there ſhalbe layed vvith in Ments a good Company in Garniſſon.

The Biſhop at Halberſtadt, Duke Chriſtiaen at Bruynſvvyck, doth cauſe to be taken on 2000 Muſquetters, to ſend to the Vnited Princes.

Heere is tydings , that betvveen the King of Bohemia & the Emperours ſolke hath beene a great Battel about Prage , but becauſe there is different vvriting & ſpeaking thereuppon , ſo cannot for this time any certainety thereof be vvritten, but muſt vvayte for the next Poſt As alſo of the Cittie Pilſen , vvhich the Earle of Mansfelt (ſo the ſpeech goeth) ſhould have delivered into the Emperours hands.

From Cadan in Bohemia , 4 mile from Raconits, the 12. November.

From Solts is certaine adviſe that the Emperours ſolk have made them ſelves with all theire might out of theire Camp, & taken their vvay to vvards Praghe, like as they vveare then com to the long mile , but as the King underſtand ſuch , he is broken up vvith his armey, and com to the lōg mile beforen the enimie, vvhere they have had a very ſtrong Battelle & on both ſides more then 6000 men ſlaine, though moſt on the Kings ſide , alſo hath the enimie gotten of the King ſom peeces of Ordenaunce and vvaggens vvith amunitie, ſo that the King muſt retire back to Praghe , and the enimie to the Weiſſenberg , there he lies yet and roves from thence to the Leut Maritſcher Crais unto Brix, hath taken in, Tiebnit Pielan & Dux alſo laid folk upon Leutmaritſcher Slauer , and Launer paſſages, that the Paſſage upon Prage is vvholy taken avvay, and this day is com heere in a certayn Perſon that brings tydinghs unto our Magiſtrat, that betvvixt Sonnevvald and Patronit, vvhere the enimie hath lien are found ſom certaine 1000 dead Bodies , & on the other ſide there King lay alſo ſom certaine 1000 dead bodies, vvhat is com to paſſe betvvixt both vve ſhal ſhortly heare.

Out of Amberghe, in the Vpper-Pallatine, the 17. dito.

Here hath beene a greate crie, that the Duke of Beyeren ſhould have taken in Praghe, and beaten our King out of the fielde, but is not certaine , for the Carle of Solms vvrites out of Waltſaxſen of the 14 of this preſent , that the Duke of Beyeren vvas broken up with his camp very ſtil & marched in al haſt to Prage, though they had left ſom 100 men vvhich lay in theire quarter ſoom houres , vvhich made fires there in, that on vvoulde not have thought but that the vvhole Armay had layen there ſtill , but as ours underſtood that they vvere gon followed they them preſently, though the Beyerens were com to Weiſſenberge before but the 8 of this preſent have ours ſett uppon the Beyerens by force, and fought the vvhole day togither , that on both ſides are ſlaine aboute 8000 men , and very many ſhould be hurt. Our King, vvith the Lord General the Earle of Hohenlo , alſo the vvhole army are vvith in Prage, & the Duke of Beyeren uppon the Weyſſenbergh & Stern ; vve hoope that they ſhall ſhortly be driven from thence What further is done betvvixt them, vve look for every houre to enquire further thereof & it ſeemes none can com from Prage, becauſe the paſſages are every vvhere ſhut

Out of Ceulen, the 24 of November.

Letters out of Neurenburghe of the 20 of this preſent, make mention , that they had adviſe from the Borders of Bohemia , that there had beene a very great Battel by Prage, betvveen the King & the Duke of Beyeren , & many 1000. ſlaine on both ſides, but that the Duke of Beyeren ſhould have any ſolke vvith in Prage, is yet uncertaine , there uppon under the Merchants vvith in Neurenberge are laid many 100. Florins that the Emperour , nor the Duke of Beyeren have no ſolke vvith in Prage. The cauſe that here comes no certainty thereof, is this; That all paſſages are ſo beſet, & ſo dangerous to travaile, that it is to vvondered at, & not enough to be vvrittē of, vvhat roveing, ſpoyling and killing is done dayly uppon all vvayes

Vppon the Schanſe Prieſls cap is ſtrongly builded, & buy dayly much vvood lime & ſtone, to make houſes there upon, and ſo provide them ſelves for the vvhole vvinter. And are not long ſince in the night 500 Souldiers paſſed by Dure out of Gulik, ſo the ſpeech goeth, there meaning ſhoulde be to build a nievv Schantſe by Flamersheym , to take avvay the paſſage from the Marquis Spinola.

Imprinted at Amſterdam by George Veſeler, A. 1620. The 2. of Decemember.

And are to be ſoulde by Petrus Keerius , dvvelling in the Calverſtreete , in the uncertaine time.

had been founded in Vienna within the first three years of the 18th century—*Posttägliche Mercurii Zeitung* and *Wiener Diarium* —were in 1780 combined as the *Wiener Zeitung*, long the government organ, and serving in that capacity at mid-20th century.

Nearly all the papers of the Austrian post-World War II daily press had been founded since the war. The chief exception, besides the *Wiener Zeitung,* was the *Arbeiter Zeitung* (1895), official Socialist organ, which with the *Tageszeitung* (1947), chief organ of the majority People's party, led the Vienna press. *Das Kleine Volksblatt* (1929), a tabloid, also represented the People's party. *Wiener Kurier,* published by the U.S. forces in Austria, had a circulation of 280,000; and the British forces published *Weltpresse* in Vienna. The provincial press increased in number and influence in the postwar period, partly because of the development of the party press. Many papers were owned by political groups. Austrian dailies commonly have no editions on Monday, but there are regular Monday papers published independently of the dailies.

Hungary.—First newspapers in what is now Hungary appeared in Budapest in the first two decades of the 18th century in the German language. The first Magyar journal consisted of the parliamentary reports of Lajos Kossuth, written out by hand under the title *Orszagyulesi Tudositasok* in 1832–34 and circulated underground. Later (1841–44) Kossuth became editor of the Liberal organ *Pesti Hirlap,* and, in the revolutionary year of 1848, of his own paper, *Kossuth Hirlapia.*

There was a remarkable development of the Hungarian press after 1867, with great latitude for free expression. The number of papers increased from 80 in that year to about 2,000 before World War I, nearly 200 of them dailies.

Despite the economic and political crises which followed World War I, the Hungarian press had been built up to about 75 dailies and 300 weeklies before World War II, nearly one-third of them published in Budapest, and many of them devoted to nazi propaganda.

During World War II all printing plants were placed under government ownership, where they remained in the postwar period. The 50-odd daily papers at mid-century represented political parties, though they all reflected the Communist views. Most of them were new since the war, though *Népszava* (1872), the oldest Hungarian paper, and a few others were exceptions. Some, such as *Szabad Nep,* were underground papers during the war. The largest morning circulation was that of *Friss Ujsâg,* and the largest among the evenings that of *Vilâgossâg;* each claimed 120,000.

Czechoslovakia.—Though German papers appeared in Prague in the early part of the 19th century, the Czech press did not develop until the middle of that century. One of the earliest Czech newspapers was *Narodni Listy* (1860), which lasted until World War II. Only a few of more than 100 dailies published in Czechoslovakia before the war survived; among survivors the oldest was *Právo Lidu* (1897), Social Democratic organ, while *Rudé Právo* (1920), official Communist organ, had the largest circulation (500,000). The German-language dailies of Prague, such as *Deutsche Zeitung Bohemia* (1827), disappeared at the end of the war.

After the Communist coup of Feb. 1948, the Czech press was completely controlled.

Yugoslavia.—The first Serbian paper was *Srpskija Novini,* founded in 1791 at Vienna; later Serbian journals appeared in Budapest and Venice. The first genuinely Croatian paper was *Narodne Novine,* founded by Ludwig Gaj in Zagreb in 1835.

Serbian papers, located chiefly in Belgrade, are printed in Cyrillic; Croatian and Slovene papers, chiefly in Zagreb, are printed in Latin characters. *Borba,* of Belgrade, is published in both languages.

After Marshal Josip Broz's (Tito) rise to power, newspapers were all published by the Communist party, the people's front, or one of the front organizations. There was rigid censorship, and the official news agency, Tanyug, provided uniformity in all except regional and occupational news.

Albania, Bulgaria, Rumania.—Strict censorship by Communist governments also prevailed in these countries after World War II. In Albania, *Bashkimi* and *Zeri i Popullit,* at Tirana, official organs of the democratic front and the Politburo of the Albanian Workers' party, respectively, were the dailies. Albanian papers had never enjoyed much freedom, though they were privately owned under the King Zog regime. There were five dailies in Sofia, Bulg., and five in the provinces in 1950. There were 14 papers in Bucharest, Rum., most of them dailies, and 28 in the provinces; 10 of the provincial papers were printed in Hungarian.

Turkey.—The earliest papers in Turkey were French journals published in the last decade of the 18th century. The first Turkish paper was *Takwimi Wekaji* (*Calendar of Events*), a translation of a French journal, *Moniteur Ottoman,* begun in the same year of 1831 by Alexandre Blac. This was a part of the westernization program of Mahmud II. No considerable development in Turkish journalism took place, however, until after the establishment of the republic in 1920 and the change from Arabic to Roman characters in printing.

Few papers published in the post-World War II period in Turkey were established before the war; the most notable exception was *Istanboul* (1868), a French-language paper. The Turkish language gained steadily in the press after 1920 until foreign-language papers were published only in Istanbul.

Greece.—Apparently the first Greek papers were published in foreign capitals by refugees from Turkish rule and propagandists for Greek freedom. These appeared in Vienna, Paris and London from 1790 to 1820. The first Greek paper in the homeland appeared immediately after the beginning of the Greek War for Independence—the *Salpinx Helleniki,* founded at Nauplia in 1821. An especially interesting journal was the *Hellenika Chronika,* edited 1824–26 at Missolonghi by the patriot Jacques Mayer.

The oldest Athenian daily at mid-20th century was the *Akropolis,* of Athens, founded in 1880 as *Mi Chanessai* by Vlassi Gabriilidis, a brilliant journalist, suspended after his death in 1919, but revived in 1928. The largest was the *Makedonia* (1908), of Salonika, which distributed about 120,000 copies daily in five editions, one of which was flown to Athens.

U.S.S.R.—The first Russian journal is said to have appeared in 1703, but the severe censorship imposed upon the press by the government prevented the development of a press adequate to the extent and population of the country. As newspapers developed in the 19th century, they came to emphasize literature and art and the political policies of government. Nicholas I permitted only 6 newspapers to be published at the mid-19th century, but Alexander II allowed more than 60 to be started in the first decade of his reign, 1855–65. These papers soon developed a radical individualism (known as Nihilism) which brought back strong repressive measures against the press, and these remained in effect past the end of the century. By 1910, however, there were about 800 papers in all of Russia, approximately 50 of them dailies. One-fourth of the daily papers were published in St. Petersburg, the capital. Among the latter were such famous papers as *Novoe Vrèmja* and *Retch.*

Meantime, the revolutionary press, now regarded as the forerunner of the modern Soviet Union press, began with *Kolokol* (*Bell*), founded first as a monthly by the refugee A. I. Herzen in London in 1857; it was soon made a fortnightly and lived for ten years, exerting a considerable influence on reforms in Russia. Similar revolutionary journals were set up by refugees in other capitals, such as Geneva and New York, and in the 1880s and 1890s there were many illegal sheets in St. Petersburg. The first legal bolshevist paper was *Nowaja Schisnj* (*New Life*), founded under Nicolai Lenin's leadership in 1905. In 1910 *Stern* (*Star*) was founded in St. Petersburg to combat other leftist groups, and two years later its place was taken by *Pravda* (*Truth*), which after the revolution of 1917 became the leading soviet organ and was published at Moscow.

In 1922 the periodical publications of the U.S.S.R. were placed in a carefully devised system which was enlarged to great proportions. Freedom of the press had been considered in most

parts of the world as meaning freedom from government dictation and censorship; in that sense, of course, no totalitarian state could possess freedom of the press. Lenin in 1920 made the definitive statement of autocratic government. "Why," he asked, "should a government which is doing what it believes to be right allow itself to be criticised? It would not allow opposition by lethal weapons, and ideas are much more fatal than guns." Propaganda for the economic, political and social building and maintenance of the U.S.S.R. thus became the dominant function of the soviet press.

The soviet publication scheme provided for a pattern in Moscow which was followed more or less closely in the other republics and to some extent in smaller units. This pattern placed at the top two daily newspapers, one representing the party and the other the government; at Moscow these were *Pravda* and *Izvestia*, respectively. Then under the party bracket were the papers designed for the political and economic indoctrination of the special groups—one for the Communist army, one for the peasants, another for industrial workers, special periodicals for youth and for younger children, and an increasing number of cultural periodicals in various fields. Under the government bracket were the organs of the commissariats of industry, economics, agriculture, etc., and the papers for trade unions and co-operatives. This pattern was repeated in the capitals of all the union republics and, with variations, in each regional and district centre.

Under this system, there were, according to reports in *Pravda* in May 1949, 7,200 papers in the U.S.S.R., with an aggregate circulation per issue of 31,000,000. Since it was impossible to draw a line between newspapers and other periodicals in this great outpouring of soviet publications, it was presumed that the above totals were inclusive. The soviet authorities did not break their totals down in terms of daily, weekly and monthly papers, but it seemed likely that little more than 5% of the total were dailies. Papers published three or four times a week were common.

Newspapers in the Soviet Union at mid-20th century were published in 80 languages, including 20 which did not exist as written languages before the revolution (Abazin, Tabasaran, Shorian, Lezghin, etc.). More than 800 papers were published in the Ukrainian S.S.R. There were papers in the Taimyr area beyond the Arctic circle, on Igarka and in the mountain villages of the Badakhshan highlands. Thousands of papers were being published on the state farms, at army installations, in schools and scientific institutions and in factories and mills. During the earlier development of the soviet press, there were many mimeographed and written papers; and "wall newspapers" in factories, on the farms and in barracks were common.

Pravda in 1950 had one of the world's largest circulations, reported at one time as high as 3,000,000 but reduced to 2,000,000 during World War II. It was a serious collection of official news, comment on foreign affairs and domestic operations, features and an occasional picture or cartoon, filling four pages. It sometimes ran a patriotic fiction serial. It was always sold out at 20 kopecks, and its circulation was limited only by available paper supply and official decisions. Its Moscow home was in two large and well-equipped buildings, in which its rotary presses could print 1,000,000 copies an hour. Leading party papers outside Moscow in 1950 included *Leningradskaya Pravda, Zvezda* (Minsk), *Pravda Vostoka* (Tashkent), *Zaria Vostoka* (Tiflis), *Vostochno-Sibirskaya Pravda* (eastern Siberia), *Kommunist* (Kiev) and *Tikhookeanskaya Zvezda* (Khabarovsk).

Izvestia (*News*) featured official documents and government statements, as well as foreign news. Its circulation was probably about half that of *Pravda*. *Krasnaya Zvezda* (*Red Star*), daily organ of the commissariat of the armed forces, was designed chiefly for officers and noncommissioned officers, but set the pattern for the local and regional army papers for the rank and file. Leading Moscow dailies of the co-operatives were *Gudok* (*Whistle*), organ of the transportation commissariat and the unions of railway workers; *Trud* (*Labour*), organ of the Central Council of Trade Unions; and *Stroitel'nyi Rabochii*, organ of the construction workers.

Among cultural papers published in Moscow were *Literaturnaya Gazeta, Kultura i Zhizn* (*Culture and Life*) and *Sovietskoye Iskusstvo* (*Soviet Art*). The youth daily was *Komsomolskaya Pravda* (*Young Communist League's Truth*) and the paper for children *Pionerskaya Pravda* (*Young Pioneers' Truth*).

The official news agency, Telegrafnoe Agentstvo Soyuza (abbreviated as Tass), was founded in 1925 to collect foreign as well as domestic news for distribution to soviet papers.

ASIATIC NEWSPAPERS

China.—The first newspaper in China and, if we accept all the claims that have been made for it, the first newspaper in the world, was a court gazette which began during the T'ang dynasty (A.D. 618–907) and was used as a means of communication between officials. It was continued in the Sung dynasty (960–1279), and early in that period it began appearing at regular intervals and achieved a considerable circulation among Chinese scholars. For title it took the term *Ti-pao*, from *ti*, palace, and *pao*, report, a word which had been applied to the earlier bulletins; it was sometimes called *Ti-chan*, or "Court Reading-Matter." In the Ming dynasty (1368–1644) the title of this gazette was changed to *Tungchengsee*. In the last reign of the Ming dynasty, that of Zung Cheng (1628–44), the bulletins, which had hitherto been either handwritten or printed from blocks, began to be printed from movable wood types. During the Ching dynasty (1644–1911) the bulletins were continued under the name *King-pao* (*Peking Gazette*). The series was allowed to perish with the Manchus after 1911.

Similar official gazettes sprang up in the provinces under Manchu rule, and gazettes by the various ministries began in 1906. But newspapers for the general public, as apart from gazettes for officialdom, did not begin in China until the 19th century, and then they were translations or imitations of the English-language press which had been established in that country by commercial and missionary agencies.

James Matheson's *Canton Register* (1827–43) was the first English paper in China; when Hong Kong became British, it was transferred to that city and became the *Hongkong Register* (1843–59). Other papers were published in Canton and Hong Kong, and in 1845 the famous *China Mail* was founded in the latter city, with Andrew Shortrede as editor; it became a daily in 1876. The *North China Herald* was founded in Shanghai in 1850; in 1864 it was made a daily under the new title, *North China Daily News*. The *China Press* was founded in Shanghai in 1915 by a group of Americans, and was edited for a time by John B. Powell.

In 1858 Wu Ting-fang suggested Chinese translations of the *China Mail*; the result was the first Chinese paper for the general public, *Chung Ngoi San Pao*. The most important paper founded for the Chinese before the crisis of 1895 was *Shun Pao*, established at Shanghai in 1872 by Frederic Major, an English-

man. At the time of the Chinese revolution in 1911, it was sold to Sze Liang-zay, who made it prosperous and influential before his assassination in 1934. Sze also owned, after 1929, *Sin Wan Pao* (1893).

A period notable for the founding of many revolutionary journals representing various reform movements began in 1895, after the defeat of China in the Chino-Japanese War. These papers had much to do with bringing about the revolution of 1911. After that, the free speech guaranteed in the provisional constitution was an invitation to hundreds of young Chinese to start journals, many of which were short-lived. The severe press laws of 1914 cut off most of the newspapers, but in the years 1918–20 the "literary revolution" and the "student movement" again gave rise to a multitude of journals. In 1921 it was reported that more than 1,000 publications were appearing in China, about half of them daily newspapers.

Sun Yat-sen's regime in Canton was especially favourable to development of the press, and the nationalist revolution of 1927 marked the beginning of another new era in the publication of newspapers in China. By 1948 there were, according to government estimates, about 1,800 newspapers, more than half of them dailies, in the entire country.

Aside from a few well-established and influential papers, most of the dailies were small in size and circulation. Many were party organs, often representing small groups. No little venality and unreliability existed among such papers. The Press law of 1914 continued throughout Pres. Chiang Kai-shek's administration to impose a stern censorship; by 1948 it was almost equally severe on English-language and Chinese papers.

During World War II, Japanese occupation of the coastal cities drove most of the great Chinese papers inland, but they were quick to recover in 1945–48. *Shun Pao* (*Shanghai Gazette*) returned to Shanghai from Hong Kong; and its sister paper, *Sin Wan Pao* (the *News Gazette*), achieved an all-time Chinese circulation record of 350,000, largely through its commercial news. National circulations grew as never before, through the establishment of multiple-city editions. Thus the Kuomintang organ *Chung Yang Jih Pao* (*Central Daily News*) was published in Nanking, Shanghai, Chungking and several other cities. The excellent and reliable *Ta Kung Pao* (the *Impartial Gazette*), founded in 1902 in Tientsin and a refugee paper during the war, kept its far-flung chain in Chungking, Chansha, Hongkong, Shanghai and Tientsin. The Catholic *Yi Shih Pao* (*Social Welfare*), founded in 1915 at Tientsin, had editions also in Nanking and Shanghai. Sizes were reduced to four pages, with the customary weekly feature supplements.

The occupation of the country by the Communist armies had, at the mid-century mark, greatly reduced the number of papers in China. Chief journal was the Communist organ, *Chieh Fang Jih Pao* (*Emancipation Daily Gazette*), of Hankow. In Manchuria the only large paper was the Mukden Chino-soviet *Daily News*.

India.—Though printing from movable types was done in India in the 16th century, and there were written newsletters during the Mogul dynasty in that century, the first newspaper attempted in the country appeared Jan. 29, 1780. This was *The Bengal Gazette or Calcutta General Advertiser*, better known as "Hickey's Gazette." James Augustus Hickey's attacks on the government and on private individuals resulted first in barring his paper from the post office and then in his arrest and imprisonment and the seizure of his paper. The second paper was Peter Reed's *Indian Gazette or Calcutta Advertiser*, begun later in the year 1780 and devoted largely to the business of the East India company; it lasted for more than 50 years. Bombay journalism began with the *Bombay Herald* in 1789, and the first in Madras was the *Madras Courier* of 1785.

The first periodical in a vernacular language was the monthly *Digdarshan* of 1818, in Bengali, by J. C. Marshman, a Baptist missionary, which soon became a weekly newspaper with the title *Samachar Darpan* (*Mirror of News*). In 1829 it became bilingual, with local and foreign news in both English and Bengali. In the early 1820s many vernacular papers appeared in Gujarati and Bengali; active in this journalism was the religious leader, Rama Mohan Roy, founder of the first Persian weekly, *Mirat-ul-Akhbar*, in Calcutta—papers which were suspended under the John Adam Press regulations. Later Roy was associated with *Banga Dutt* (*Bengal Herald*), printed in Bengali, Persian, Hindi and English. Most famous of Bengali papers was *Ananda Bazaar Patrika*, founded in 1878, and enjoying by mid-20th century the third largest circulation of all Indian dailies—50,000. This paper and the other leading daily in Bengali, *Jugantar* (1937), were both published in Calcutta.

The leading English-owned papers in India at mid-20th century were: the *Statesman* of Calcutta (with a New Delhi edition), founded by Robert Knight in 1875, which absorbed the *Englishman* (1821) and *Friend of India;* the *Times of India,* of Bombay, founded in 1838 as *Bombay Times* and long regarded as the chief newspaper in India; the *Civil and Military Gazette,* founded in Simla in 1872 but later moved to Lahore (now in Pakistan); and the *Pioneer* of Allahabad, founded in 1865, and famous for the service on its editorial staff of Rudyard Kipling for a few years in the latter 1880s.

Half a dozen leading Indian papers in the English language were owned by Indians at mid-century. The *Hindu,* Madras, began as a mimeographed journal of a literary society, became a regular weekly in 1878 and a daily in 1889. The *Tribune* of Ambala Cantt, East Punjab, founded in 1881 and made a daily in 1906, became a modern and influential paper. *Amrita Bazaar Patrika,* founded in 1860 in a village near Calcutta, was in 1871 moved to that city and was made a bilingual paper. After the Vernacular Press act of 1878, it was made an English paper and gained the largest circulation of any newspaper in India. The *Bombay Chronicle* was founded in 1913 by Sir Pherozeshah Mehta. The *Free Press Journal* of Bombay was founded in 1930 by S. Sadanand, the outgrowth of a news agency; the *National Standard,* Bombay, became the nationalist outgrowth of the antinationalist *Morning Standard.* The *Hindustan Times,* founded in 1923, was edited for a number of years by Devadoss Gandhi, son of Mohandas K. Gandhi.

The daily press of India in 1950 consisted of more than 300 papers with an aggregate circulation of probably 1,250,000. About 40 papers might be said to have national circulation, nearly all of them published in Calcutta, Bombay, Madras or New Delhi. About half the papers in these four cities were printed in English..

Indian newspapers in 1948 formed their own co-operative news agency under the name of the Press Trust of India Ltd., taking over the 50-year-old Associated Press of India Ltd., which was a Reuters subsidiary. The Indian press at the same time joined that of the United Kingdom, Australia and New Zealand in the general management of Reuters, being represented in that organization by a trustee and a director.

Pakistan.—Following the birth of this new state in 1947, a number of new journals were established. Pakistan lost some of its papers by their removal to India, but gained its largest daily, *Dawn,* which removed from Delhi to Karachi, where it continued to publish editions in several languages. Leading English-language papers in 1950 were the *Civil and Military Gazette* and *Pakistan Times* at Lahore, and the *Daily Gazette* and *Sind Observer* at Karachi. Leading vernacular papers were *Anjam* and *Jang,* two Urdu dailies at Karachi, and *Al Wahid,* chief Sindhi daily of that city.

Japan.—Newssheets called *yomiuri* appeared in Japan late in the 17th century. They were printed from blocks and were sold by vendors who attracted customers by reading the news aloud; hence the name, which means "selling by reading aloud," and later became the title of one of the greatest of Japanese newspapers.

The first newspaper in Japan was the English-language *Shipping List and Advertiser* (1861) of Nagasaki, which was soon moved to Yokohama to become the *Japan Herald.* Several other papers in English were begun in the 1860s. The first periodical in the Japanese language was a series of official translations of foreign news, issued monthly, of which the earliest was *Batavia Shimbun* (1862), derived from a Dutch paper in

Java. The first Japanese newspaper for general circulation was the *Shimbunshi* (1864), established by an adventurous sailor named Joseph Hikozo, who had become a naturalized U.S. citizen but had later returned to Yokohama. This paper was followed by other Yokohama papers in Japanese, published by Englishmen and Americans.

But it was in 1868, the year of the Meiji restoration, that Japanese journalism really began. In that year 16 papers, in Tokyo, Osaka, Kyoto, Yokohama and other cities, were founded. This development continued despite strict censorship, many imprisonments of editors and occasional forcible suspensions.

The *Tokyo Nichi-Nichi* was founded in 1872, with the famous Genichiro Fukuchi, dramatist and educator, as its editor. In 1906 Hikoichi Motoyama, manager of one of the great industrial syndicates which were growing up in Japan, bought the *Nichi-Nichi* and made it an associate of the *Osaka Mainichi*, which he had owned for many years. The latter paper was founded as *Osaka Nippo* in 1876, but Motoyama rechristened it *Mainichi* when he bought it in 1888. These two papers set a great pace in enterprise, foreign correspondence and a degree of sensationalism. Each paper ran its circulation to more than 1,000,000 before World War II. Provincial papers were founded or purchased, including *Kyushu Mainichi* at Moji. In the war consolidations of 1942–43, these were all lost except the Kyushu paper. From the ordeal, however, the Tokyo and Osaka papers emerged with nearly 1,500,000 circulation each, and the one in Kyushu with more than 500,000.

The *Osaka Asahi* was founded in 1879 by Ryuhei Murayama, one of the greatest journalists of the Meiji era. It flourished, winning respect for its careful news coverage and progressiveness, and in 1888 the *Tokyo Asahi* was begun. Establishing connections with the *Times* of London, the *New York Times* and the Associated Press, these papers built up circulations of more than 1,000,000 each, covering the island of Honshu; in 1935 the Asahi company established the *Seibu* (Kokura) *Asahi* on the southern island of Kyushu. In the postwar period the Tokyo and Osaka papers each had about 1,500,000 circulation, and the Kyushu paper more than 500,000.

Founded in 1874, the *Yomiuri* of Tokyo had made a success in the 1930s by its emphasis on sports, finance and politics. In the combinations of 1942 it was consolidated with *Hochi*, founded in 1872 by friends of Marquis Okuma and later owned by Seiji Noma, the "magazine king." In the war years it gained on its competitors, reaching nearly 2,000,000 circulation in 1944.

By 1937 the Japanese press, despite a period of stern repression preceding the constitution of 1889, had reached a very prosperous position. Beginning about 1889, it had largely changed over from the system of party journals to that of more or less independent mass-circulation papers. In 1937 there were 1,200 dailies and 600 weeklies in Japan. In the next two years, as the government tightened its control, there was a small decline; in 1940–41 came a reduction of 36% annually; in 1942, at government "suggestion," wholesale combinations were made which left one daily in each *ken*, or district, outside the largest cities. This brought the total down to 53. After the end of the war in 1945, the number soon advanced to about 130, and it remained in that neighbourhood at mid-century.

Many newspapers suffered damage to plants during the war. Under the administration of the supreme commander for the Allied Powers (S.C.A.P.), newspaper management was "purged," and a precensorship set up which operated until July 1948. Some papers have reduced the 9,000 ideographs known to the learned to fewer than 2,000 used in their columns, in order to bring their articles and editorials within the reading knowledge of the masses, using the syllable alphabet known as *kana* as an aid.

Nearly half the daily circulation of Japanese newspapers at mid-century was concentrated in Tokyo and Osaka, with 17 papers in the former city and 10 in the latter. The "Big Three" in Tokyo—*Yomiuri, Asahi* and *Mainichi*—sold only about 5% of their copies on the street, while *Tokyo Shimbun* (representing a wartime consolidation of *Miyako Shimbun*, 1884, and *Kokumin Shimbun*, 1890) sold most of its nearly 500,000 circulation from pavement "stands." Two other notable Tokyo papers were *Nippon Keizai Shimbun* (1876), the "*Wall Street Journal* of Japan"; and *Nippon Times*, an English-language daily edited by Japanese. The latter paper was a war consolidation of the *Japan Times* (1897) and the *Japan Advertiser* (1890).

Osaka, besides its *Asahi* and *Mainichi* and a few less important papers, had the *Osaka Shimbun*, a 1942 combination of the *Jiji* (1905) and the *Yukan-Osaka* (1922). Papers with circulations of more than 500,000 outside Tokyo and Osaka were: *Chubu Nihon Shimbun*, Nagoya; *Hokkaido Shimbun*, Sapporo; *Mainichi Shimbun, Nishinihon Shimbun* and *Asahi Shimbun*, Fukuoka. Kyoto had four dailies and Nagoya six.

A feature of the Japanese newspaper is the employment of a large staff. The *Osaka Mainichi* in 1950 employed 2,300 men, about one-third of them on the editorial side. Employment on a newspaper was generally a lifetime position. Newspaper labour unions had become strong, though the attempt made by the Yomiuri union in 1946 to seize editorial management was defeated.

The leading news agency at mid-20th century was Kyodo Tsushin Sha (Mutual Wire-Service company), the lineal descendant of the old government-subsidized Domei, founded in 1936.

The Republic of the Philippines.—The pioneer of the Philippine press was *Del Superior gobierno*, a sheet devoted to European news, published in Manila 1811–12. Occasional brief experiments in journalism, often encountering government censorship, appeared up to the U.S. occupation in 1898. The first daily was *La Esperanza* (1846–49). The government's official gazette was founded in 1848 as *Diario de Manila*. The leading paper for many years was *El Comercio* (1858–1925). After 1888 a greater liberality in the censorship and the development of political groups, chiefly nationalist in character, resulted in the establishment of a large number of papers, most of which were small and short-lived. The first paper in the Tagalog language was *Patnubay Nang Catolico* (1890).

For the first year or two after the U.S. occupation, there was an orgy of newspaper founding. The *Manila Times*, first U.S. daily in the islands, was founded by Thomas Cowan in 1898; it later passed into Filipino hands and became a leading paper in circulation and influence. The *Manila Daily Bulletin* was established in 1900 as an advertising give-away paper, but was placed on a subscription basis four years later. *La Independencia* (1898) became the leading organ of the Emilio Aguinaldo insurrection and was moved from place to place until captured by the U.S. forces.

In World War II all Manila newspaper plants were destroyed or looted by the Japanese. Following the liberation from Japanese rule in 1945 and the establishment of the republic in the following year, the Manila and provincial press was greatly expanded.

Burma; Singapore; Federation of Malaya.—Only about a dozen daily newspapers were published in Burma before World War II, but that number had quadrupled by 1948. The oldest paper was *Hanthawaddy* (1889). The Burmese press, stimulated by national independence, became concentrated in Rangoon. Other languages were represented in the provincial press of lower Burma.

The crown colony of Singapore had 16 daily papers in 1948. They circulated not only in the city but largely also in the Federation of Malaya. The *Straits Times* (1845) had a special Malayan edition. There were papers in English, Chinese and the Indian and Malayan languages.

Newspapers in the Federation of Malaya (formed in Feb. 1948) were likewise in English, Chinese and Indian and Malayan languages. After the federation, the Malay press tended to increase. A leading paper in the capital was the *Malay Mail* (1896).

Indonesia.—A newspaper called *Batavaise Nouvelles* was published in Batavia, Java, as early as 1744–46 as a small two-page weekly. Other government gazettes appeared as the colony passed from the French to the Dutch, and then to the English

and back to the Dutch. The *Bataviasche Courant* was begun in 1816, changed to *Javasche Courant* in 1828, and continued for more than a century. Continuous struggles with censorship marked the development of the press in the Netherlands Indies. An outstanding paper was founded in Semarang, Java, in 1852 by P. J. de Groot called *Semarangsh Neuws- en Advertentie-blad,* but changed in 1863 to *Locomotief;* in 1870 it became a daily. At mid-20th century it was still respected and influential.

At the time of the inauguration of the Republic of the United States of Indonesia in 1949 there were 35 dailies in the islands, printed in Nederlands, Chinese and the various native tongues; nearly half were in Nederlands. *Sin Po,* of Batavia, had one edition in Malayan, founded in 1909, and one in Chinese, founded in 1921.

Iran; Iraq.—Though there were earlier newssheets concerned with court events, the first regular newspaper in Persia was *Rúznáma,* an official gazette established in Tehran in 1851. With some changes in title, this journal continued for many years, and the modern official daily *Iran* may be said to be descended from it. The first Persian daily was *Khulásatul-Hawádith* (1898), a small two-page paper, printed on one side from type and lithographed on the other. Though typography had been introduced into Persia as early as 1817, it was superseded by lithography during most of the last half of the 19th century. After the revolution and during the constitutional period 1906–12, there were many new papers.

In the years when arbitrary censorshp existed, not a few papers were printed in Persian in Calcutta, Constantinople, and other cities and circulated widely in Persia. One of the most famous of these was Aqa Muhammad Tahir's *Akhtar* (*Star*), published in Constantinople 1875–96.

Many brief political papers were published during the chaotic war period in Iran, some of which continued after the re-establishment of the national sovereignty in 1947. Among survivors from a somewhat earlier period were such papers as *Ettelaat* (1924), *Kooshesh* (1922) and *Setareh* (1928); these were all in Tehran. The daily press was also represented in Tabriz, Shiraz, Isfahan and Meshed.

Political papers abounded in Baghdad after release from Turkish rule and the beginnings of Iraqi nationalist movements about 1920. The *Iraq Times* was founded in 1914 as the *Bagdad Times,* printed in English, except for one page in Arabic. *Al Akhbar* was the leading Baghdad daily printed in Arabic in 1950.

Israel.—First Hebrew daily paper in Palestine was E. B. Yehudah's *Haheruth* (1909–15). With the establishment of Israel in 1947, its capital, Tel Aviv, became an active newspaper centre. Two years later it had seven morning and three evening dailies, all in Hebrew. The largest of these papers (circulation 35,000) was a four-page "tabloid" called *Mariv* (1948). Oldest of them was *Ha'aretz,* founded in Egypt in 1918 and the next year moved to Jerusalem, and later to Tel Aviv. The others were party papers, most important of which was *Davar* (1925), an administration spokesman. The *Palestine Post* (1932), only English-language daily in Israel, was published in Jerusalem.

Lebanon.—Not a few of the Lebanese newspapers were established before 1900, but all were small in circulation. There were about 40 dailies at mid-century, mostly published in Arabic. The largest daily was *L'Orient* (1925), one of several French-language papers in Beirut. The largest in Arabic was *Al Ammal.*

Browne, *The Press and Poetry of Modern Persia* (Cambridge, 1914).

LATIN-AMERICAN NEWSPAPERS

Mexico.—A Mexican newssheet published in 1541 constituted the earliest printed news in the western hemisphere. It was published by Juan Pablos and was an account of the Guatemalan earthquake of the preceding year, entitled *Relacion del terremoto de Guatemala.* The first regular newspaper came nearly two centuries later, *Gaceta de México* (1722). The first dailies were *Diario de Mexico* and *Diario de Veracruz,* both begun in 1805. Arbitrary censorship was the rule and tradition in Mexico. The constitution of 1857 was liberal in language, but did not in practice afford any considerable freedom of the press. In the long presidency of José de la Cruz Porfirio Díaz, however, economic stability was favourable to the development of the newspaper industry. The "insurgent press," beginning with *El Despertador americano* (1810–11), from time to time played an important part in national affairs. Papers in Indian languages were established in the 1880s, as *Purepe* of Quiroga, in Tarascan; *Mor* of Tepoztlán, in Aztec; and others in Maya and Zapotecan in Yucatán and Oaxaca.

Daily newspapers in Mexico in 1950 numbered about 100, of which one-fourth were published in the federal district. Nearly all had been founded since 1920, and many since 1940. The only important daily dating back to the 1880s was *El Correo de la tarde* (1885) of Mazatlán. The largest papers in Mexico City were: the established and respected *El Universal* (1916), with its evening tabloid edition, *El Universal gráfico* (1922); *Excelsior* (1917); and *Novedades* (1932). These journals had large Sunday editions and affiliated radio stations. There was one paper owned and operated by the government, *El Nacional* (1929). Guadalajara and Monterrey, the next largest cities, had four dailies each.

The circulation of Mexican dailies, regional rather than national, virtually doubled in the decade 1940-50.

Central America.—The earliest printing in Central America was at Antigua, in the colony of Guatemala; but it was in the town of Guatemala that a monthly *Gaceta* was established in 1729. The country's oldest daily in 1950 was *Diario de Centro-America,* founded the year after the adoption of the constitution of 1879 as *El Guatemalteco.* There were seven Guatemalan dailies—four in Spanish, two in English and one in Chinese. *El Imparcial* (1922) had the largest circulation.

In Honduras the first paper was the *Gaceta de Honduras* (1830), in Comayagua; the first daily was *El Diario* (1897), in Tegucigalpa, the capital. In 1950 Honduras had 2 dailies in the capital, as well as 5 which appeared three or four times a week, and 24 weeklies and semiweeklies.

British Honduras had the *Belize Daily Clarion* (1897) and three weeklies.

Nicaragua's first paper was *El Telégrafo nicaragüenese* (1835) of León, and its first daily was the *Diario de Nicaragua* (1884) of Granada. In 1948 there were nine dailies in Managua (including the government's *Gaceta*), two in León and one in Bluefields.

El Salvador had a paper at San Sebastian called *Liberal guipuzcoano* in 1820. In 1948 there were seven dailies in the capital, San Salvador, of which *Diario oficial* (1847), the government gazette, was the oldest, and *La Prensa gráfica* (1915) and *El Diario de hoy* (1936) foremost in circulation and influence.

El Noticioso universal, established by Joaquin Bernardo Calvo at San José in 1832, was Costa Rica's first newspaper. There were four dailies in that city in 1948, each claiming 10,000 to 20,000 circulation.

In what is now Panamá, *Miscelanea del Istmo* was established in 1822, and short-lived political papers appeared from time to time; but modern Panaman journalism began with the founding of the *Panama Star* by a group of American "forty-niners" bound for California but temporarily detained awaiting ship. Their main purpose appears to have been to publish an account of their celebration of Washington's birthday, and the paper was begun Feb. 24, 1849. The paper soon came into other hands, and when Panamá seceded from the Colombian federation in 1853 it was made a daily and given a Spanish section, which eventually became a separate edition called *Estrella de Panamá.* The *Panama Herald* (1851) was absorbed in 1854, and the English edition became *Panama Star & Herald.* The

Panama American and its associate *El Panamá-América* began in 1925, and the *Nation* and *La Nación* in 1944.

West Indies.—In 1764 the printer Olivos was ordered by the captain general of Cuba to issue a monthly *Mercurio,* and other official gazettes were published later; but the first general newspaper in the island was *Papel periódico de la Habana* (1790). Strict censorship was the rule under the Spanish government, and even after independence there was occasional interference with the press, especially during the Gerardo Machado regime, 1925–33. The chief paper with a national circulation in 1950 was *Diario de la marina* (1832), much the oldest of Cuban papers. There were 50 dailies in the island, almost half of them published in Havana. *Diario de la marina, El Pais* (1921) and *Prensa libre* (1941) were the largest. There was one daily in English, the *Havana Post* (1895), and three in Chinese.

The *Gazette du Cap,* of uncertain history, is said to have been Haiti's first paper. The *Gazette politique et commerciale d'Haiti* (1804) was the first government organ of the new republic. In 1948 Haiti had six daily papers, all published at Port-au-Prince.

Somewhat larger in circulation were the two dailies at Ciudad Trujillo in the Dominican Republic, *La Nación* (1940) and *El Caribe* (1947).

La Gaceta was founded as the official organ of the Spanish government of Puerto Rico in 1807 and continued until the occupation of the island by United States forces in 1898. In 1949 there were three dailies in San Juan, one in Ponce and one in Arecibo. *El Imparcial* (1917) and *El Mundo* (1919) claimed more than 50,000 circulation each.

Robert Baldwin began the *Weekly Jamaica Courant* in 1718 at Sant' Jago de la Vega, the capital until 1872. In 1950 the morning *Daily Gleaner* (1834) was the chief paper of Kingston, and the evening paper was the *Daily Express* (1940).

Colombia.—Manuel del Socarro Rodriguez was the publisher of the earliest papers issued in what was then called Santa Fé de Bogotá; they were the *Gaceta* (1785) and the *Papel periódico* (1791–95). In 1948 Bogotá had 10 dailies and other Colombian cities 29. *El Tiempo* of Bogotá was the largest, claiming 100,000 circulation.

Ecuador.—The first-known newspaper in Ecuador was the *Gaceta de Santafé* (1785) of Quito. No further paper was printed in the country until after the revolution of 1809, when the *Gaceta de la corte de Quito* was begun. *El Telégrafo* (1884) was Ecuador's oldest daily in 1950. *El Comercio* (1906) was the most important of Quito's seven dailies; it also owned *Ultimas noticias* (1938), the capital's only evening paper.

Venezuela.—The first Venezuelan newspaper was the *Gaceta de Caracas* (1808). The oldest daily in Venezuela in 1950 was *La Religión* (1890) of Caracas. Of the 27 dailies in the country, 10 were published in Caracas, the capital. Only one of these, however, *El Nacional* (1943), with about 50,000 circulation, had a national distribution.

Peru.—Probably the earliest newssheet printed in South America described the capture of the pirate Richard Hawkins off the Peruvian coast; it was issued by Antonio Ricardo at Lima in 1594. The first titled and numbered paper was *Gaceta de Lima* (1744). Peruvian newspapers, both under Spanish rule and after establishment of the republic in 1822–23 were firmly controlled by government.

Except for the government gazette, *El Peruano,* which was founded in 1820, the oldest newspaper in 1950 was *El Comercio* (1839) of Lima, which was also the largest, having a combined morning and evening circulation of more than 100,000.

Bolivia.—In 1825, the year in which the name of Alto Peru was changed to Bolivia, the *Gaceta de Chuquisaca* and the *Cóndor de Bolivia* were founded in the capital, Chuquisaca, later renamed Sucre. Bolivian newspapers, chiefly owned by political factions, were unstable until some time after the adoption of the Press law of 1925. The oldest daily in 1950 was *El Diario* (1905) of La Paz. *La Razón* (1917), also of La Paz, was the largest.

Brazil.—Brazil's first weekly newspaper was the official *Gazeta do Rio de Janeiro* (1808), which in 1823 became *Diario do govêrno.* The country's oldest paper in 1950 was *Diario de Pernambuco* (1825) of Recife. Founded in 1827 was *Jornal do comercio* of Rio de Janeiro, which, though its circulation was less than those of most other papers in the capital in 1950, had long enjoyed a high reputation and influence as a conservative journal.

With the fall of the empire in 1889, there was a rapid development of newspapers, and in the next 20 years the number of papers and periodicals increased from about 600 to 1,000. By 1950 there were more than 300 dailies, of which 22 were in the capital and 20 in São Paulo.

The largest paper in Brazil in 1950 was *O Globo* (1925) of Rio de Janeiro, which claimed 140,000 circulation. Perhaps the outstanding paper in São Paulo was *O Estado de São Paulo* (1875). *A Noite* (1911) had long been a leading paper in Rio. Diarios Associados had become a strong group of 24 daily papers and 14 radio stations spread widely over the country and including such large papers as *Diario da noite* (1929) and *O Jornal* (1919) in Rio, *Diario da noite* (1925) in São Paulo and *Diario de Pernambuco* in Recife.

Argentina.—*El Telégrafo* (1801-02), the first newspaper published in Argentina, came from the Buenos Aires press of Francisco Cabella y Mesa, a printer who had already engaged in journalism in Lima, Peru. It was followed by a few other papers in the first decade of the century, and, after the first national government was established in 1810, by an official *Gaceta* (1810-21). The chaotic period which preceded the Juan Manuel de Rosas regime (1829-52) brought out many small, vituperative political sheets, but Rosas limited the regular Argentine press to a few papers which were forced to confine themselves to commercial news and official documents. Meantime, Argentine journalists took refuge in other South American countries, there to spread their doctrines of liberty and reform. After the fall of Rosas, many of these men returned and renewed the conflicts of political journalism.

The modern Argentine press began in the 1860s. *La Nación Argentina* was founded in 1862 and became one of the great South American newspapers. In 1869 José Clemente Paz founded *La Prensa,* which was to win even greater fame. The *Standard,* English-language daily still published in 1950, was begun in 1861; and the oldest Spanish-language daily, *La Capital,* was begun in Rosario in 1867.

About 180 dailies were published in Argentina in 1949 and more than 80 cities had at least one daily. A considerable foreign-language press existed in Buenos Aires.

La Prensa, long considered one of the world's great newspapers, had the largest circulation (385,000) of any Spanish-language newspaper in the world at mid-20th century. Still owned by the Paz family, it had become famous for its voluminous world-news report, for its remarkable classified advertising section, for its editorial independence and for its special public services.

La Nación also had strong international news coverage, and gave much attention to technical and transportation problems. Its circulation in 1950 was more than 300,000. *Critica* (1913), long the third paper in Buenos Aires, had fallen behind *Democracia* (1945) and *La Razón* (1905) during the newsprint crisis at the mid-century mark.

Uruguay.—The publication of Uruguay's first paper was occasioned by the brief British occupation of Montevideo in 1807; it was an English-Spanish sheet called *La Estrella del Sur.* Many papers, chiefly political, appeared during the troubled history of the country; probably the longest life was that enjoyed by *El Telégrafo* (1850–1931). José Batlle y Ordóñez founded *El Dia* in 1886.

The above-mentioned papers were published in Montevideo, where 15 of the 31 daily papers (with more than nine-tenths of the circulation) in Uruguay were still situated in 1950. Leading morning papers were *El Dia* and *El Pais* (1919), and the chief evenings were *El Diario* (1923) and *El Plata* (1915), affiliated with *El Dia.*

Paraguay.—Journalism in Paraguay dates from the middle of the 19th century, though it was irregular until about 1898. There were never more than six dailies in the country at once; there were three at mid-20th century, all published at Asunción—*La Tribuna* (1925), *El Pais* (1923) and *La Unión* (1949).

Chile.—The earliest of Chile's papers was *La Aurora de Chili,* issued in 1810 at Santiago. *El Mercurio* was founded at Valparaíso in 1827 and *La Unión,* another important paper, was established in the same city in 1885.

In 1902 Augustin Edwards, owner of Valparaíso's *El Mercurio,* founded another morning paper of the same name in Santiago; this chain eventually came to include two evening papers in the capital and one in Valparaíso. The Santiago *Mercurio* had the largest circulation of any Chilean daily in 1950—about 100,000. *La Nación* (1917) of Santiago was government-owned.

NORTH AFRICAN NEWSPAPERS

Egypt.—The first Egyptian paper was *Le Courrier de l'Egypte,* issued by Napoleon's forces at Cairo in 1798. This and the similar *La Décade egyptienne,* of the same year, were temporary; but an official gazette established in 1828 as a part of Mohammed Ali's program of national development, and printed in both Turkish and Arabic, lasted. With the establishment of the Egyptian post office in 1865, and under the encouragement of Ismail's government, a dozen or more papers sprang up in Cairo in the next decade, with two in Alexandria and one in Port Said. With British rule, the Egyptian press developed under a licensing system.

The oldest of the daily newspapers in Egypt at mid-20th century was *Al Ahram* (the *Pyramid*), a survivor from the Ismail regime. Founded in Alexandria in 1875, it was moved to Cairo in 1899. Long published by Gabriel Takla Pasha, *Al Ahram* introduced linotypes with Arabic characters and rotary presses into Egypt in 1904, employed correspondents abroad and achieved a circulation which exceeded 100,000 in its best years.

There were more than 50 daily newspapers in Egypt in 1950, and about 200 weekly publications. There were 22 dailies in Arabic, 14 of them published in Cairo, as well as 13 in French, 7 in Greek and 2 each in English and Armenian.

Morocco.—The oldest Moroccan daily (founded as a triweekly) in 1950 was the sultan's organ, *Es Saâda* (1905), of Rabat; the oldest privately operated paper was *La Vigie morocaine* (1907) of Casablanca. The latter paper was the largest evening paper in Morocco at mid-century, with somewhat less than 50,000 circulation, while *Le Petit morocain* (1921) was the largest morning journal; both were published in Casablanca.

Algeria.—The oldest and largest Algerian daily in 1950 was the *Echo d'Oran* (1844), published in that city. Nearly all the Algerian papers were still published in French, though there were three Arabic weeklies. There were in 1949 ten dailies in the country—four in Algiers, three in Oran, two in Bona and one in Constantine.

Tunisia.—The press of this country was concentrated in Tunis, where there were in 1949 nine daily newspapers, six of them in French and three in Arabic. The oldest was *Ez-Zohra* (1886); next came the largest Tunisian newspaper, *La Dépêche tunisienne* (1888), with 33,000 circulation.

Other African States.—In Portuguese East Africa (Mozambique) there were in 1949 three daily papers at Lourenço Marques. Rhodesia had one daily at Salisbury and one at Bulawayo, with several weeklies in Afrikaans and native languages. The Gold Coast had four dailies, three at Accra and one at Kumasi. In Nigeria there were eight daily papers, five of them published at Lagos. Sierra Leone had three dailies at Freetown, and one weekly. At Nairobi, in British East Africa, there were two dailies and six weeklies, while Mombasa had three dailies. Tanganyika Territory had two dailies, both at Dar es Salaam. Four dailies were published at Khartoum, in the Sudan, two in Arabic and two in English. There were also two daily papers at Antananarivo, Madagascar.

Bibliography.—Martin Hartmann, *The Arabic Press of Egypt* (London, 1899); United Nations Educational, Scientific and Cultural Organization, *Report of the Commission on Technical Needs in Press, Film, Radio* (Paris, 1949); Benn Brothers, *The Newspaper Press Directory* (London, 1949); Karl Bömer, *Handbuch der Weltpresse* (Berlin, 1937). (F. L. Mt.)

NEWT, the name applied to the small salamanders of the genus *Triturus,* represented in Europe, temperate Asia and Japan, and in North America north of the tropics. All of the species are aquatic during the breeding season and as larvae. After transformation, the adults of some species, like the common crested newt of Europe, take up life on land, while others, like the North American red-spotted newt, live permanently in water. All feed on small insects and other invertebrates.

Newts exhibit considerable differences between the sexes, associated with an elaborate courtship. Fertilization takes place by the deposition of a spermatophore, which is taken up by the female after the courtship stimulation. The male sexual characters are much more pronounced during the breeding season; they consist in ornamentation with brighter coloration and higher crests on back and tail; and the hind limbs are provided with strong horny ridges.

Newts in general lay their eggs singly and these are attached to water plants. They hatch in about two weeks, and the aquatic larval gilled stage lasts for about three months. Under certain conditions some newts may fail to transform, becoming sexually mature as larvae (*see* Metamorphosis). The red-spotted newt of eastern North America (*Triturus viridescens*) is remarkable for a coral-red land stage that lasts for three years after loss of the gills, after which, with transformation of the skin texture from rough to smooth and change of colour to green, the adult permanently aquatic stage is attained.

Three species, the crested, common and palmated newts, are found in Great Britain. The newts of eastern North America include three races of the spotted newt and two less well-known forms.

The newts of the Pacific states have been much studied by embryologists, with the result that their distribution, breeding behaviour and development are exceptionally well known.

The best known of the Asiatic newts is the Japanese fire-bellied newt, *Triturus pyrrhogaster,* which is often to be seen as an aquarium animal in Europe and North America.

See H. F. Gadow, "Amphibia and Reptiles," *Cambridge Natural History* (1901); F. Werner, "Die Lurche und Kriechtiere," in A. E. Brehm, *Tierleben,* 4th ed. (1914); S. C. Bishop, *Handbook of Salamanders* (1943). (K. P. S.)

NEW TESTAMENT: *see* Bible.

NEW THOUGHT, the general name for idealistic tendencies of thinking which arose in the United States, and especially in New England, about the middle of the 19th century. These tendencies were akin to the transcendentalism of the Concord school of Ralph Waldo Emerson, Henry D. Thoreau, Margaret Fuller and Amos Bronson Alcott, and have affinities with Plato, Neoplatonism and the Vedanta philosophy of India.

Beginning with the omnipresence and immanence of the Divine, the followers of this school taught a progressive conquest of human ills by re-establishing harmony between the Divine and the human spirit.

See R. W. Trine, *In Tune with the Infinite* (1921).

NEWTON, ALFRED (1829–1907), English zoologist, was born at Geneva on June 11, 1829. In 1854 he was elected travelling fellow of Magdalene college, Cambridge, and subsequently visited many parts of the world, including Lapland, Iceland, Spitsbergen, the West Indies and North America.

In 1866 he became the first professor of zoology and comparative anatomy at Cambridge, a position which he retained till his death on June 7, 1907. His services to ornithology and zoogeography were recognized by the Royal society in 1900, when it awarded him a Royal medal.

He wrote many books, including *Zoology of Ancient Europe* (1862), *Ootheca Wolleyana* (begun in 1864), *Zoology* (1872) and a *Dictionary of Birds* (1893–96), an amplification of the numerous articles on birds which he contributed to the ninth edition of the *Encyclopædia Britannica.*

NEWTON, SIR CHARLES THOMAS (1816–1894), British archaeologist, was born on Sept. 16, 1816, at Bredwardine in Herefordshire, and educated at Shrewsbury schools and Christ Church, Oxford. He entered the British museum in 1840 as an assistant in the antiquities department. In 1852 Newton left the museum to become vice-consul at Mitylene, with the object of exploring the coasts and islands of Asia Minor. Aided by funds supplied by Lord Stratford de Redcliffe, then British ambassador at Constantinople, he made in 1852 and 1855 important discoveries of inscriptions at the island of Calymnos, off the coast of Caria; and in 1856–57 achieved the great archaeological exploit of his life by the discovery of the remains of the mausoleum of Halicarnassus, one of the "seven wonders" of the ancient world. He was greatly assisted by Murdoch Smith, afterward celebrated in connection with Persian telegraphs. The results were described by Newton in his *History of Discoveries at Halicarnassus* (1862–63), written in conjunction with R. P. Pullan, and in his *Travels and Discoveries in the Levant* (1865). These works included particulars of other important discoveries, especially at Branchidae, where he disinterred the statues which had anciently lined the Sacred way, and at Cnidus, where R. P. Pullan, acting under his direction, found the colossal lion now in the British museum.

For 25 years, 1860–85, Newton was keeper of Greek and Roman antiquities in the British museum. He was Yates professor of classical archaeology at University college, London, (1880–88). His collected *Essays on Art and Archaeology* were published in 1886.

Newton died at Margate on Nov. 28, 1894.

NEWTON, SIR ISAAC (1642–1727), English natural philosopher, was born at Woolsthorpe near Grantham on Dec. 25, 1642. His father had died the previous October and his mother, Hannah, daughter of J. Ayscough of Market Overton, married again in 1645 Barnabas Smith, rector of North Welham, Leicestershire.

After his mother's second marriage her son had lived with his grandmother, Mrs. Ayscough, at Woolsthorpe, but on his stepfather's death his mother returned to her former home and her boy rejoined her.

For about two years he had attended the grammar school at Grantham, then kept by Stokes. He is said to have made little progress with his books until a successful fight with another boy aroused a spirit of emulation and led to his becoming head of the school.

At the age of 14 on his mother's return (1656) he was taken from school to assist her on her farm. This, however, was not

a success; he occupied himself with mathematics when he ought to have been attending to his work. His uncle, William Ayscough, rector of Burton Coggles, was a member of Trinity college, Cambridge, and in 1660 by his advice Newton was sent back to school to prepare for Cambridge. On June 5, 1661, he was matriculated as a subsizar at Trinity college. Three years later he was elected as scholar and in Jan. 1665 proceeded in due course to the degree of Bachelor of Arts. In 1667 he was elected a fellow of the college.

In the early part of 1665 he discovered what is now known as the binomial theorem, and a little later came the elements of the differential calculus which he called fluxions. In May of the following year he writes "I had entrance into the inverse method of Fluxions" (in modern terms the principles of the integral calculus and the method for calculating the area of curves or the volume of solids) "and in the same year [1666] I began to think of gravity extending to the orb of the Moon . . . having thereby compared the force requisite to keep the Moon in her orb with the force of gravity at the surface of the Earth and found them to answer pretty nearly All this was in the two years 1665 and 1666 for in those years I was in the prime of my age." The same period saw the commencement of his work on optics and colour.

The account of Newton's colour experiments was sent to the Royal society in 1672. He had been elected a fellow on Jan. 11 of that year and soon got into correspondence with Henry Oldenburg, the secretary. "I shall endeavour," he wrote, "to show my gratitude by communicating what my poor and solitary endeavours can effect towards the promoting of philosophical design." His "New Theory about Light and Colours" was read on Feb. 8.

The experiments he described showed conclusively, he claimed, that "Light consists of Rays differently refrangible"; that "Colours are not qualifications of Light derived from refractions of natural bodies as is generally believed but original and connate properties which in divers Rays are divers . . . to the same degree of refrangibility ever belongs the same colour and to the same colour ever belongs the same degree of refrangibility." During the period covered by this work he had become Lucasian professor of mathematics. Barrow resigned in his favour in 1669, and Newton's first course of lectures dealt with optics; hence his renewed interest in the subject, and the experiments with the prism bought at Stourbridge fair in 1666, culminating in the Royal society paper of 1672. But the paper led to controversy. The Royal society solemnly thanked the author "for his ingenious discourse" and he was to be informed "that the society think very much of it."

Robert Hooke, along with Seth Ward, bishop of Salisbury, and Robert Boyle, were desired to peruse the discourse and report. Hooke in his *Micrographia* (1664) had described an experiment which was fundamentally the same as Newton's with the prism, but he had made no use of it; the theory of colours he attempted to deduce was valueless; however, while admitting the truth of Newton's observations, he declined to accept any of the conclusions drawn from them. The paper, when published, at once attracted attention, and others abroad joined in the discussion, the most important issue of which was Newton's assertion that the length of the band of colours produced at a given distance from the prisms was the same for prisms of any substance provided their angles were such that the deviation for the mean ray of the band was the same in all.

In this, as was learned later, Newton was wrong; the length of the band, the spectrum, is not proportional to the average or mean deviation; it is possible to have two spectra of the same length in which the deviations are markedly different; thus, if two such prisms are mounted with their vertices in opposite directions, the light emerging from the second will be achromatic, largely free from colour, but will be deviated from its original path.

Newton's experiments on colour, made in all probability in order to study a defect of the telescope, led him to the belief that the defect was incurable. By putting a divergence lens behind the converging lens of the object glass the colours could again be combined, but, so he concluded, his rays would all be made parallel to their original direction, and would no longer converge to form a real image, which could be magnified by the eyepiece; the telescope could not be made to give a colourless (achromatic) image. This belief he retained throughout his life, but it was wrong. Dispersion and the separation of the colours are not proportional to deviation.

Shortly after Newton's death Chester Moor Hall invented an achromatic telescope and by 1733 had made several, and in 1758 John Dollond the optician took up the matter and constructed satisfactory achromatic lenses.

But his mistake had important consequences. A real image (one, that is, through which the light actually passes) of a distant object can be formed by reflection at a concave mirror, and since the laws of reflection, unlike those of refraction through a transparent medium, are independent of colour, the reflected image is the same colour as the object—the rainbow band is there no longer. Chromatic aberration, as it is called, is no more a disturbing factor. This then led Newton to make his reflecting telescope in which a concave mirror takes the place of the object glass; the first telescope was made in 1668; the second was sent by him to the Royal society in Dec. 1671 shortly before his election as a fellow.

Discussions as to the optics paper lasted until 1675. "I was so persecuted," he writes in December of that year, "with discussions arising out of my theory of light that I blamed my own imprudence for parting with so substantial a blessing as my quiet to run after a shadow." But they had their advantage. They led him to investigate other effects of colour, to inquire how light was produced and to develop the emission or corpuscular theory of light, according to which light is caused by the emission by a luminous body of a host of tiny particles travelling in empty space with a speed of 190,000 mi. per second; the laws of reflection and refraction were developed on mechanical principles, aided only by a supplementary hypothesis as to why, when falling on a transparent surface, some of the particles are reflected—bent back into the medium from which they have come—and others are refracted, along a new path inclined to the old, into the medium toward which they are travelling. It is a consequence of this theory that light travels more quickly in a dense medium such as glass than in air. The theory was also applied to explain the colours seen when light is reflected from a thin film, a soap film or the thin layer of air between a convex lens of large radius and a flat reflecting surface on which it rests; in this case, when viewed in reflected light of a definite colour a series of dark and light rings circling round a central black spot is seen. Newton determined the law connecting the radius of a bright ring and the colour of the light and since the radius depends on the colour, the bright rings for the various colours, when white light is used, will be different and the observer will see a series of coloured rings surrounding the black central spot.

Hooke was again a critic; in his *Micrographia* he had adopted the wave theory of light, due originally to Christiaan Huygens, according to which light is energy transmitted by wave motion through a medium pervading space, the universal ether, and had endeavoured to explain, but without success, rectilinear propagation, reflection and refraction as well as dispersion and the colours of thin plates. Hooke's arguments were vague and carried no conviction to a mind like Newton's; the latter sought a mechanical explanation for all he observed. Newton in his explanation of the reflection and refraction of the corpuscles of a light centre made use of the idea of a wave in an ethereal medium; he rejected Huygens' theory and thought little of Hooke's attempts at explanation, and so for 100 years or more Newton's theory held the field. In 1804 Thomas Young, professor at the Royal institution, London, established the principle of interference by which he showed that under certain conditions two parcels of light from identical sources falling on a screen could produce a series of bright and dark bands. Along certain lines on the screen there is a maximum of brightness; along others intermediate between these there is darkness. From this and the brilliant work of the French genius Augustin Fresnel, a few years later, came the explanation on the wave theory of all the phenomena of light as then observed.

"In the fourth place," says Newton, writing in 1675, "I sup-

pose light is neither aether nor its vibrating motion but something of a different kind propagated from lucid bodies. . . . Fifthly it is to be supposed that light and aether mutually act upon one another." Did he here build more truly than he knew? Who can say, but we must revert to other work, to other discoveries on which his fame will rest secure till time shall end.

In 1666, when at Woolsthorpe on account of the plague at Cambridge, he "began to think of gravity extending to the orb of the Moon," though of this nothing was published for 18 years.

Discussions went on in London at the Royal society or in the houses of the members, Sir Christopher Wren; Seth Ward, bishop of Salisbury; Robert Boyle; Hooke; Edmund Halley; and the others who were active in the society, until one Wednesday in Jan. 1684 Halley met Wren and Hooke and the latter declared "that he had demonstrated all the laws of the celestial motions." Halley confessed his ignorance and Sir Christopher "to encourage enquiry said he would give Hooke or me"—the quotation is from a letter of Halley to Newton—"two months to bring him a convincing demonstration." Sir Christopher offered to give "a book of 40 shillings" to the one who first found the solution. He was not convinced of Hooke's assertion that he had done it, but wished to conceal the result "that others trying and failing might know how to value it when he would make it public." So it remained till August, when Halley visited Newton at Cambridge and put the question, what would be the path of a body moving under the action of a central force which varied as the inverse square of the distance from the centre. "I then learned," writes Halley in the same letter, "that you had brought this demonstration to perfection." Newton promised to look for the old proof already mentioned but could not find it, "and not finding it did it again and reduced the work into the proposition," which he sent in November to Halley, who immediately returned to Cambridge and persuaded Newton to put them in form for the Royal society.

On Dec. 10, 1684, Halley informed the society that he had lately seen Newton at Cambridge who had showed him a curious treatise, *De Motu,* which, upon Halley's desire, was sent to the society to be entered on their register, "and a tract, *Propositiones de Motu,*" was registered in Feb. 1685 with the date in the margin, Dec. 10, 1684.

But the early months of 1685 were fertile with a new discovery. Newton was away from Cambridge; hitherto his calculations had proceeded on the assumption that the sun and the planets could each be treated as though they were points, concentrated at their respective centres, though which the various forces were assumed to act; but was this true or was it merely an approximation resulting from the fact that the planetary distances were so immense that even a great sphere like the sun could in comparison be treated as a point? What will be the force with which the sun attracts an exterior particle?

Newton proceeded to work this out, on the assumption that each particle of the sun attracted the external particle with a force which was proportional to the product of the masses of the two and inversely proportional to the square of the distance between them and found (we know he had no expectation of the result until it emerged from his calculations) that if the sun were of uniform density, or consisted of a series of concentric shells each of uniform density, then the resultant force on the external particle was the same as that which would be exerted by the whole mass of that concentrated at the centre.

It was no approximation; the sun and the planets, considered as spherical, really behaved as point centres of force.

In the opinion of Professor Adams, it was the difficulty of solving this problem and not the uncertainty as to the moon's distance which caused Newton in 1665 to lay aside his astronomical calculations, which were now resumed with a more correct knowledge of the moon's distance. Newton returned to Cambridge and the writing of the *Principia* was begun in March 1686.

The work is entitled *Philosophiae Naturalis Principia Mathematica.* It is in three books; the first, *De Motu Corporum,* was finished on April 28, 1686, and exhibited to the Royal society on that day. On June 20, 1687, Newton wrote that the second book was ready. "The third I now design to suppress. Philosophy is such an impertinently litigious lady that a man had as good be engaged in lawsuits as have to do with her." Halley was able to prevent this, and on Sept. 6, 1687, the third book, described as *De Systemate Mundi,* was presented; the whole was published about midsummer 1687.

We owe much to Halley; at the time the Royal society was in difficulties as to funds he took the whole cost on himself. Hooke, when the first book was presented, claimed that he had forestalled Newton in a great part of it, and in the correspondence which followed Halley did all he could to smooth over the difficulties and persuade Newton to continue his work. Newton's letter quoted above indicates his own feelings and in a letter to Halley of July 14, 1686, he had written, "I have considered how best to compose the present dispute, and I think it may be done by the enclosed scholium to the fourth proposition."

In a corollary to the fourth proposition Newton showed that Kepler's third law was a consequence of the elliptic path of a planet under an inverse square law; the scholium runs:

"The case of the sixth corollary applies to the heavenly bodies as our friends Wren, Hooke and Halley have already inferred and therefore I have decided to develope fully all the consequences of a force decreasing as the inverse square." The great work did this: the *Principia* established Newton's fame; some little time elapsed before it was fully accepted on the continent but for more than 200 years it reigned supreme, and all theories of cosmogony were based on the principles laid down by Newton. His mechanics guided astronomers and men of science in their search for natural knowledge. And if in later years Einstein carried us some steps further and picked up some few more of the jewels of truth which Newton sought on the shore, Newton's laws remain, included it may be, in a more comprehensive statement of the truth.

In 1687 James II tried to force the university to admit as a Master of Arts Father Alban Francis, a Benedictine monk, without taking the oaths of allegiance and supremacy. Newton was one of those who led the resistance to the royal action, and appeared before Lord Jeffreys to argue the case for Cambridge. In the end the deputies were reprimanded and Pechell, the vice-chancellor, was deprived of his office. Newton's share in the affair led to his being elected member of parliament for the university in 1689, retaining the seat till the dissolution next year. He was elected again in 1701, but he never took any prominent part in politics.

On the dissolution of Parliament in 1690 he returned to Cambridge and continued for a time his mathematical work; this was interrupted in 1692–94 by a serious illness. He was suffering from insomnia and nervous trouble. There was a report that he was going out of his mind. Huygens in June 1694 wrote to G. W. Leibniz, "I do not know if you are acquainted with the accident to the good Mr. Newton, namely, that he has had an attack of phrenitis which lasted eighteen months and of which they say his friends have cured him by means of remedies and keeping him shut up." For some time his friends had been anxious to obtain for him some recognition of his work; this came in 1695. Charles Montague, later earl of Halifax, a former fellow of Trinity who was chancellor of the exchequer, offered him the post of warden of the mint. This he accepted and four years later became master. In the same year he was elected one of the eight foreign associates of the French Academy of Science.

In 1696 John Bernoulli addressed a letter to the mathematicians of Europe challenging them to solve two problems and giving six months for the solution. On Jan. 29, 1697, Newton received from France two copies of the printed paper containing the problems and the following day sent the solution to Montague, then president of the Royal society. They were transmitted anonymously to Bernoulli, who recognised the author in his disguise *"tanquam ex ungue leonem."*

As warden of the mint Newton had retained his Cambridge offices, but soon after his appointment as master he named William Whiston as deputy, and in 1701 he resigned his professorship and the fellowship at Trinity. Whiston became Lucasian professor. Newton had moved to London, and continued his duties as master

with marked efficiency until his death in 1727.

The remainder of his life calls for little notice; in 1703 he became president of the Royal society and was re-elected annually until his death. Queen Anne visited Cambridge in 1705 as the guest at Trinity lodge of the master, Richard Bentley, and on this occasion Newton was knighted. About the same time the controversy with Leibniz as to the invention of the differential calculus began. It is now generally admitted that Leibniz invented the calculus later than, and independently of, Newton.

In the middle of 1708 Newton, at the urgent request of Bentley, consented to let Roger Cotes, a fellow of Trinity, edit a second edition of the *Principia;* the volume was published in 1713 and a third edition by Pemberton appeared in 1726.

Early in 1727 Newton, whose health had been failing for some time, was taken seriously ill; he died on March 20, 1727, and was buried in Westminster abbey on March 28.

BIBLIOGRAPHY.—G. J. Gray, *Bibliography of the Works of Sir Isaac Newton, with a List of Books Illustrating His Works and Notes,* 2nd ed. (1908); *Isaac Newton, 1642–1727* (bibl.), a collected edition of Newton's work, which gives all the published works with the not unimportant exceptions of the *Arithmetica Universalis,* the *Principia,* the *Opticks* and the *Methodus Fluxionum* (Lausanne and Geneva, 1744). The fullest edition is that issued in 5 vol. by Samuel Horsley in 1779–85, under the title *Opera quae extant omnia;* it is not complete, among notable omissions being the papers published in the *Philosophical Transactions.*

The standard biography is *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton,* by Sir David Brewster, 2 vol. (Edinburgh, 1855); it was reprinted in 1860. Brewster also wrote a short *Life of Sir Isaac Newton,* 2 vol. (1831), of which a new edition appeared in 1908. Valuable critical commentaries are to be found in *Essays on the Life and Work of Newton,* by Augustus de Morgan, edited with notes and appendices by P. E. Jourdain (1914). A brief account of Newton's life and works is given in *Sir Isaac Newton,* by S. Brodestsky (1928). Of great value to students of Newton is the *Catalogue of the Portsmouth Collection of Books and Papers Written by or Belonging to Sir Isaac Newton* (1888), which describes the great mass of Newton's papers which came at his death into the hands of Conduitt. *Correspondence of Scientific Men of the 17th Century, etc., from the Originals in the Collection of the Earl of Macclesfield,* by S. P. Rigaud (1841) and *Correspondence of Sir Isaac Newton and Professor Cotes, Including Letters of Other Eminent Men,* by J. Edleston (editor of the 2nd ed. of the *Principia*) (1850) contain many Newton letters, and the latter volume includes a synoptical view of Newton's life. Among general commentaries must be mentioned: H. Pemberton, *A View of Sir Isaac Newton's Philosophy* (1728); Colin Maclaurin, *An Account of Sir Isaac Newton's Philosophical Discoveries* (1775); and F. Rosenberger, *Isaac Newton und seine Physikalische Principien* (1895).

The *Opticks,* first published in 1704, went through three editions in Newton's lifetime; the last (4th) edition appeared in 1730. Of great importance for the controversy with Leibnitz is the report drawn up by order of the Royal Society, published under the title *Commercium Epistolicum* (1712), of which editions appeared in 1722 and 1725.

Since the first issue in 1687 there have been many editions of the *Principia,* including two others in Newton's lifetime. The Geneva reprint of 1739–42 contains a voluminous commentary by Le Sueur and Jacquier, and was long used. Lord Kelvin and H. Blackburne edited a good edition (Glasgow, 1871). The first three sections of Book I of the *Principia* have been edited by, among others, J. Carr (1821), J. H. Evans (1838), G. L. Cooke (1850), P. Frost (4th ed., 1883). An English translation of the *Principia* was first published by Andrew Motte in 1729; the best edition is that of 1803. *See* also S. P. Rigaud, *Historical Essay on the First Publication of Sir I. Newton's Principia* (1838); W. W. R. Ball, *Essay on Newton's Principia* (1893); J. W. L. Glaisher, *Bi-Centenary of Newton's Principia* (1888); P. G. Tait, *Newton's Laws of Motion* (1899); *Isaac Newton, 1642–1727,* a memorial volume (1927); History of Science Society, *Sir Isaac Newton, 1727–1929* (1928); L. T. More, *Isaac Newton* (1934); W. Stukeley, *Memoirs of Sir Isaac Newton's Life, 1752* (1936); J. Dougall, *Sir Isaac Newton* (1939); J. W. N. Sullivan, *Isaac Newton, 1642–1727* (1938); H. W. Turnbull, *Mathematical Discoveries of Newton* (1945); Royal Society of London, *Newton Tercentenary Celebrations, 15–19 July 1946* (1947). (R. T. GL.; X.)

NEWTON, JOHN (1725–1807), English divine, the friend of William Cowper, was born in London on July 24, 1725 (O.S.). His father, who for a long time was master of a ship in the Mediterranean trade, became in 1748 governor of York Fort, Hudson bay, where he died in 1751. The lad had little education and served on his father's ship from 1737 to 1742; shortly afterward he was impressed on board a man-of-war, the "Harwich," where he was made a midshipman. For an attempt to escape while his ship lay off Plymouth he was degraded, and treated with so much severity that he exchanged into an African trader. He made many voyages as mate and then as master on slave-trading ships, devoting his leisure to the improvement of his education. He left the sea in 1755, when he was appointed tide surveyor at Liverpool. He began to study Greek and Hebrew, and in 1758 applied to the archbishop of York for ordination. This was refused him, but having had the curacy of Olney offered to him in April 1764 he was ordained by the bishop of Lincoln. In Oct. 1767 William Cowper settled in the parish. An intimate friendship sprang up between the two men, and they published together the *Olney Hymns* (1779). In 1779 Newton left Olney to become rector of St. Mary Woolnoth, London. He died on Dec. 31, 1807.

Like Cowper, Newton held Calvinistic views, although his evangelical fervour allied him closely with the sentiments of Wesley and the Methodists. His fame rests on certain of the *Olney Hymns* (*e.g.,* "Glorious things of Thee are spoken," "How sweet the name of Jesus sounds," "One there is above all others")

His prose works include an *Authentic Narrative of some Interesting and Remarkable Particulars in the Life of John Newton* (1764); *Omicron* (a series of letters on religion, 1774); and *Cardiphonia* (1781). His *Letters to a Wife* (1793) and *Letters to Rev. W. Bull* (posthumous, 1847) illustrate the frankness with which he exposed his most intimate personal experiences. A *Life* of Newton by Richard Cecil was prefixed to a collected edition of his works (6 vol., 1808; 1 vol., 1827). *See* also T Wright, *The Town of Cowper.*

NEWTON, JOHN (1823–1895), U.S. general and engineer, was born in Norfolk, Va., on Aug. 24, 1823, and graduated from the U.S. Military academy in 1842. From 1842 to 1861 he was engaged in coast defense constructions and waterway improvements; he was assistant professor of engineering in the Military academy from 1843 to 1846, became a captain in 1856 and was chief engineer in the Utah expedition of 1857–58. He served in the Virginian campaign of 1861, and was promoted brigadier general, U.S. volunteers. He distinguished himself in the Seven Days' battle and at Antietam, and after the battle of Fredericksburg was made major general, U.S. volunteers. In the Chancellorsville campaign Newton took part in the storming of Marye's heights at Fredericksburg, on May 3, 1863, and at the battle of Gettysburg he was for a time in command of the 1st corps. Later in Gen. W. T. Sherman's army, as a division commander under Gen. Oliver O. Howard, he took part in the Atlanta campaign For gallant conduct at Peach Tree creek he was made brevet brigadier general, and at the close of the war was made brevet major general, U.S. army. In 1884, he became chief of engineers, and held this position until his retirement in 1886. In 1887–88 he was commissioner of public works in New York, and from 1888 until his death on May 1, 1895, was president of the Panama railway.

See Gustavus Smith, *In Memoriam of General John Newton* (1895).

NEWTON, a city of Iowa, U.S., 32 mi. E. of Des Moines, on federal highway 6 and state highway 14. It is the judicial centre of Jasper county. It is served by the Rock Island, the Minneapolis and St. Louis railways and by a bus line. The population of Newton in 1950 was 11,723 and in 1940 was 10,462. It is a manufacturing town, and two leading washing machine manufacturers have plants there. Other products manufactured are trench excavators, highway equipment, advertising specialties and caskets.

The city was founded in 1846 and incorporated in 1857.

NEWTON, a city of Kansas, U.S., 160 mi. S.W. of Kansas City, in the fertile Arkansas river valley, on federal highways 50S and 81, and served by the Missouri Pacific and the Santa Fe railway systems; the county seat of Harvey county. The population was 11,590 in 1950, and in 1940 (federal census) 11,048.

It is the seat of Bethel college, founded (1887) and still supported by the Mennonites; a division point on the Santa Fe, and an important shipping point for grain, milk and other agricultural products. Its principal manufactures are flour (1,400,000 bbl. a year), bread, potato chips, ice, poultry products and trailer coaches.

Newton was founded in 1871 and chartered in 1872. For several years, beginning in 1873, it was the focus of a large immigra-

tion of German Mennonites from Russia and various parts of the United States. These immigrants played an important part in building up the city and developing the surrounding country. They brought from Russia the Crimean wheat seed from which was grown the first crop of hard winter wheat in Kansas.

In 1927 Newton adopted a commissioner-manager form of government.

NEWTON, a city of Middlesex county, Mass., U.S., 8 mi. W. of Boston, on the southern bank of the Charles river, and served by the Boston and Albany railroad. The population was 81,994 in 1950, 69,873 in 1940 and 65,276 in 1930 by the federal census.

The city has 11 mi. of river front and a land area of 17.4 sq.mi. Within its boundaries are 14 villages and 34 parks, including parts of the metropolitan park system. It is primarily a residential suburb, but has a variety of manufacturing industries, with an output in 1947 valued at $23,666,000. The assessed valuation for 1950 was $182,827,850.

Newton was incorporated as a separate town in 1688 and received its present name in 1691. In 1873 it was chartered as a city. A monument marks the site of Waban's wigwam, where John Eliot, on Oct. 28, 1646, founded the first Indian church. At Newton Centre is the Newton Theological institution, the first Baptist theological seminary established in the U.S. (1825).

NEWTON ABBOT, a town and seaport of Devonshire, England, 20 mi. S. by W. of Exeter on the Western region railway route. Population (1951) 16,393. Area of urban district, 6.5 sq.mi. Situated at the head of the Teign estuary, the town grew rapidly in the 19th century. The two parish churches, St. Mary's in Wolborough and All Saints' in Highweek, are Perpendicular in style. St. Mary's contains a Norman font. The Jacobean Forde house was visited by Charles I and William of Orange, who first read his declaration to the people of England at Newton Abbot market cross. The portion of Newton Abbot in the parish of Highweek was formerly a separate town known as Newton Bushel. Agriculture is the chief industry, but the locomotive and carriage works employs many men and there are a foundry and malthouses.

NEWTON-IN-MAKERFIELD or NEWTON-LE-WILLOWS, an urban district in Lancashire, England, 15½ mi. W. of Manchester on the London Midland region railway route. Population (1951) 21,862. Area 4.9 sq.mi. Newton-in-Makerfield gave its name in Saxon times to one of the hundreds of Lancashire. The barony was held by the Banastres from the Conquest to 1286 and passed successively to the Langtons, Fleetwoods and Leghs. The barons were not summoned to parliament, and the title fell into disuse after the abolition of feudal tenures. Near the town is a moated Elizabethan half-timbered house and also an ancient barrow. The industrial establishments include foundries, printing and stationery works, paper mills and glassworks. Coal abounds in the neighbourhood. Newton was anciently a borough and sent two members to parliament from 1559 to 1832.

NEWTOWN, a market town of Montgomeryshire, Wales, situated on the Severn in a narrow part of the valley near the eastern border of the county. Pop. of urban district of Newtown and Llanllwchaiarn (1951) 5,427. Area 11.3 sq.mi. It shares with Welshpool the privilege of being the administrative capital of the shire. We first hear of it as a Llan (church settlement), known as Llanfair Cedewain, in the 13th century. The presence of water power was probably a factor in the origin and growth of the settlement at this time. The Norman Mortimers established there the market of their new territories on the border. In the 15th century the New Town received a municipal charter with a constitution modelled upon that of Hereford and Breteuil, but the corporation was abolished in the days of Charles I. Through the early 19th century the flannel factories of the town were of great importance, but the flannel industry is no longer carried on, though there are still distributing warehouses. In the days of coach roads Newtown was a route centre, for the old road from Ludlow via Bishops' castle and Kerry had to drop into the Severn valley and so reached Newtown.

The old church, now in ruins, is superseded by the modern St. Mary's, with the font and rood screen of the old building.

NEWTOWNARDS, a municipal borough of County Down, Northern Ireland, near the northern extremity of Strangford lough, on a branch of the Belfast and County Down railway, 9½ mi. E. of Belfast. Pop. (1951) 12,237. Area .74 sq.mi. The town owes its origin to a Dominican monastery founded in 1244 by Walter de Burgh. It received a charter from James I. The ruined abbey of Movilla, 1½ mi. N.E., is attributed to St. Finian (*c.* 550). One of the two Ulster civil airports is there. Linen is the principal trade.

NEW ULM, a city of southern Minnesota, U.S.A., on the south bank of the Minnesota river, 88 mi. S.W. of Minneapolis; the county seat of Brown county. It is on federal highway 14 and is served by the Chicago and North Western and the Minneapolis and St. Louis railways. The population was 9,348 in 1950; it was 8,743 in 1940 by the federal census. It is an important trading centre in a rich agricultural region; has a large milling industry (particularly rye) and is the seat of Martin Luther college (1884). New Ulm was founded in 1854. During the Sioux uprising of 1862 it was twice attacked and almost destroyed.

NEW WASHINGTON, a municipality of the province of Capiz, island of Panay, Republic of the Philippines, on the north coast about 17 mi. W. of Capiz, the provincial capital. Pop. (1939) 12,192 (a gain of 2,315 since 1918); there were no whites. New Washington is the port for the Aklan valley. The principal crops are palay (rice), abacá (Manila hemp), maize (corn) and sugar. Cattle and horses are bred for export as well as for domestic use, and household industries are numerous. The vernacular is Panay-Bisayan. Of the inhabitants aged 6 to 19, inclusive, 40% were reported in 1939 as attending school, and 40% of the population 10 years old and over was reported as literate.

NEW WESTMINSTER, city on the north bank of the Fraser river, 17 mi. from the mouth, and British Columbia's largest freshwater port. Pop. (1951) 28,390. Founded in 1859, it was the capital of British Columbia when the British possessions on the Pacific coast formed two colonies; *i.e.,* British Columbia (the mainland portion) and Vancouver Island. The city has a fine harbour with 30 to 40 ft. of water, modern terminal facilities and a cold storage plant and has a large trade, particularly in timber. It is a manufacturing centre, fish, fruit and vegetable canning, iron founding, oil refining, shingle and lumber mills and shipbuilding being among the industries; fruitgrowing, dairying and mining are carried on in the district. The city is on the Canadian Pacific, Great Northern and Canadian National railways, and is connected with Vancouver, 12 mi. distant, by electric railway. St. Ann's academy and St. Louis college are located there.

NEW YEAR'S DAY, the first day of the year. In the Gregorian calendar this date occurs 12 days earlier than in the Julian; thus New Year's day is the English Jan. 13.

The ancient Egyptians, Phoenicians and Persians began their year at the autumnal equinox (Sept. 21) and the Greeks until the 5th century B.C. at the winter solstice (Dec. 21). The ancient Romans once celebrated the beginning of the year on Dec. 21, but Caesar by the adoption of the Julian calendar postponed it to Jan. 1. The Jews have always reckoned their civil year from the first day of the month of Tishri (Sept. 6–Oct. 5), but their ecclesiastical year begins at the spring equinox (March 21). March 25 was the usual date among most Christian peoples in early mediaeval days. In Anglo-Saxon England, however, Dec. 25 was New Year's day. At the Norman Conquest, because, it is believed, of the coincidence of his coronation being arranged for that date, William the Conqueror ordered that the year should start on Jan. 1. But later England began its year with the rest of Christendom on March 25. The Gregorian calendar (1582), which restored Jan. 1 to its position as New Year's day, was accepted by all Catholic countries at once; by Germany, Denmark and Sweden about 1700, but not until 1752 by England.

NEW YORK, one of the original 13 United States of America, situated between approximately 40° 30′ and 45° N. and between 71° 51′ and 79° 46′ W. Although one of the smaller states in the union, being 29th in area, New York ranks first in population and in wealth, and has won for itself the name "Empire

state." Its northern boundary is, for the most part, formed by Lake Ontario and the St. Lawrence river, which separate it from the province of Ontario, Can.; but north of the Adirondacks the boundary line leaves the St. Lawrence, extending in a due east direction to the lower end of Lake Champlain. Thus the boundary between New York and the province of Quebec, Can., is wholly artificial. Vermont, Massachusetts and Connecticut bound New York on the east; the Atlantic ocean, New Jersey and Pennsylvania on the south; and Pennsylvania, Lake Erie and the Niagara river on the west. The state has a triangular outline, with a breadth from east to west of 326.46 mi. and from north to south, on the line of the Hudson, of 300 mi. In addition, it includes Long Island and Staten Island on the Atlantic coast. Its land area is 47,944 sq.mi. and the area of the inland waters is 1,632 sq.mi., giving a total area of 49,576 sq.mi. In addition to this, New York includes 3,140 sq.mi. of water in Lake Ontario and Lake Erie.

Physical Features.—The most notable topographic feature is the roughly circular mountain area of northeastern New York, known as the Adirondack mountains (*q.v.*). This is a very ancient mountain mass of Pre-Cambrian rocks resembling more the Laurentian mountains of Canada than the Appalachians. Indeed, it is commonly considered to be an extension of the Canadian mountains. Parts of this crystalline area are worn down to a condition of low relief, but in the main mountain mass, although greatly worn, there are still elevations of truly mountainous proportions. The highest peak is Mt. Marcy (5,344 ft.), though associated with it are several other peaks with elevations from 4,000 ft. to 5,000 ft. Even the higher summits are worn to a rounded condition, and are therefore for the most part forest-covered up to the timber line which, on Mt. Marcy, is at an elevation of about 4,900 ft. From the crest of the dome of the Adirondacks proper the surface slopes in all directions to surrounding lowlands; to the St. Lawrence valley on the north; the Champlain-Hudson lowland on the east; the Mohawk valley on the south; and Lake Ontario on the west. The Adirondack area proper, and much of the surrounding ring of more recent rocks, is either too rugged or has a soil too thin and rocky for extensive agriculture. It is, therefore, a sparsely settled region with lumbering and mining of iron (magnetite) and titanium as the leading industries. Because of the varied and beautiful scenery, this is a favourite summer resort; the game of the forest and the fishing in the streams and in the multitude of lakes serve as further attractions. In the peripheral ring farming increases, especially dairying; and manufacturing industries connected with the products of forest, farms and mines are developed. These and other manufacturing industries are greatly aided by the extensive water power furnished by the mountain streams which flow out radially from the central area.

South of the Adirondack region, and south of the Mohawk valley, rises a high-level plateau which extends westward to the Pennsylvania boundary. Here the rocks are all essentially horizontal and of the Palaeozoic age, mainly Devonian. This plateau province, which includes more than half the state, differs greatly from place to place. Its elevation decreases toward the north by a series of steps, the lowest elevation being on the Ontario plain which skirts the southern shore of Lake Ontario. Similar to this is a narrow plain along the southern shore of Lake Erie, which, in fact, lies in a shallow depression in this Erie plain. Both these plains are so level, and have so fertile a soil, that they are the seats of extensive agriculture, especially fruit raising, which is further encouraged by the influence of the large bodies of lake water that moderate the heat of summer and the cold of winter, and tend to check the late frosts of spring and the early frosts of autumn. Elsewhere in the plateau province the land is higher and the surface far more irregular, increasing in ruggedness toward both the south and the east. Elevations of 1,500 ft. and 2,000 ft. are common in this region all the way from Chautauqua county in the extreme west to the Catskill mountains in the east; and in places the surface becomes so rugged as to simulate the features of mountains and locally to win the name of mountain. Valleys are deeply sunk in the plateau, the largest with bottom lands of sufficient width to give rise to strips of fertile farmland. The valley walls rise to undulating and often fairly level uplands, which are, in large part, cleared of forest. In the main they are grazing lands—the seat of important dairy and sheep-raising industries. In lakeside areas, grapes are grown. Since the plateau region is a northward extension of the Allegheny plateau, which skirts the western base of the Appalachian mountains, it rises as the mountains are approached. Thus, in southeast New York, where the Appalachians enter the state, the plateau becomes much higher than in the west, reaching its culmination in the Catskills. Here, partly because of elevation, and partly because of the resistant nature of the Catskill sandstone, dissection has so sculptured the plateau as to carve it into a mountainous mass generally known as the Catskill mountains (*q.v.*). In this part of the plateau, summit elevations of from 3,000 ft. to 4,000 ft. are common, the highest point being Slide mountain (4,204 ft.). Like the Adirondacks, this region is largely forest covered, and is a favourite summer resort; but it is far less a wilderness than the Adirondacks, and in places is cleared for farming, especially for pasturage. In the plateau province there are other areas known as mountains, of which the Helderberg mountains are the most conspicuous. This formation is really an escarpment facing the lower Mohawk and the Hudson river, south of Albany, where there is a downward step in the plateau. The steeply rising face of the plateau here is a result of the resistance of a durable layer of limestone, known as the Helderberg limestone. Of other lower escarpments the most notable is the Niagara which extends eastward from Canada, past Lewiston and Lockport—a downward step from the Erie to the Ontario plain.

South and southeast of the Catskills, although including only a small portion of the state, there are a number of different topographic features, caused by the belts of different rock structure which cross the state from southwest to northeast. The most pronounced of these upfolded strata in New York form the low Shawangunk mountains, which descend, toward the southeast, to a lowland region of folded strata of limestone, slate and other rocks in Orange and Dutchess counties. This lowland area, as a result of the nonresistant character of the strata, is a continuation of the Great Valley of the Appalachians, and extends northeast into Vermont and southwest across New Jersey, Pennsylvania, Maryland and Virginia. It is bounded on its southeast side by the Highlands, a belt of Pre-Cambrian crystalline rocks extending northeast into Connecticut and Massachusetts, and southwest into the highlands of New Jersey and thence to the Blue ridge. South of the Highlands, in New Jersey, but extending to the very banks of the Hudson, is a belt of Triassic sandstone with intrusions of trap rock, which, on account of its peculiar columnar jointing, has developed a palisade structure—the famous Palisades of the lower Hudson. Long Island, though modified by extensive glacial deposits, may be considered a northeast extension of the coastal plains which attain a much more perfect development in New Jersey and the states farther south.

The entire surface of New York, with the exception of a very small area in the extreme west, in Chautauqua and Cattaraugus counties, was covered by the continental glacier. It broadened and deepened many of the valleys; rounded the hills; turned aside many streams, causing changes in drainage and giving rise to innumerable waterfalls and rapids; and it formed the thousands of lakes, large and small, which dot the surface. As the ice receded, it halted at various points, forming moraines and other glacial deposits. Thus the soil of almost the entire state has been derived by glacial action.

The drainage of New York finds its way to the sea in various directions. The St. Lawrence system receives most, mainly from short streams from the plateau province and from the Adirondacks. A small part of the state, in the west, drains to the Ohio, and thence, by way of the Mississippi, to the Gulf of Mexico; and a much larger area drains into the Susquehanna, entering the head of Chesapeake bay. A part of the Catskills, and the region farther south, drains into Delaware bay through the Delaware river. Thus, New York is pre-eminently a divide region, sending its drainage, by various courses, into widely separated parts of the

ocean. Only the Hudson (*q.v*) and a few streams in the extreme south have independent courses to the sea within the state itself The Hudson is by far the most important river in the state, for, because of the sinking of the land, which has admitted the tide as far as Troy, it is navigable for 151 mi. from the sea. It is noted for its remarkable scenery, especially where it crosses the highlands. Westward from Troy, the Mohawk valley furnishes a highway which is followed by canal, railway and motor road. Thus there is here a gap, easily traversed, across the Appalachian mountains and plateaus to the more level and fertile plains beyond.

There are about 8,000 lakes and ponds in the state, most of them small and all, including Lakes Erie and Ontario, the result of glacial action. The largest lake apart from Erie and Ontario is the beautiful Lake Champlain, on the eastern boundary. Into this drains Lake George, known as the "Lake Como" of America. The largest lake entirely within the state is Oneida lake. In the central part of the state is a series of peculiar, nearly north-and-south elongated lakes, known as the Finger lakes. The largest are Cayuga, Seneca, Keuka, Canandaigua, Owasco and Skaneateles. Here too is Watkins Glen State park. In the extreme western part of the state is Chautauqua lake, beautifully situated in the plateau of western New York. New York is noted for its many falls and rapids, some of them of great beauty. Of these the largest is the cataract of Niagara, about 1 mi. wide and 167 ft. high. The American fall is entirely within the state; but the Canadian boundary line passes down the centre of the Horseshoe or Canadian fall. Other notable falls are those of the Genesee at Portage and at Rochester, the falls in the Cayuga and the Seneca valleys, Trenton falls, the Falls of Ticonderoga, and a multitude of falls and rapids in the Adirondack region.

New York has an extensive coast line along the Great Lakes, 75 mi. on Lake Erie and more than 200 mi. on Lake Ontario. The largest of the lake ports is at Buffalo at the head of Niagara river, where, because of the Niagara cataract, lake boats from the west must transfer their goods to rail or canal. Buffalo lies at the lower end of natural lake navigation, though by the building of a ship canal in Canada, lake steamers can proceed into Lake Ontario and thence to the St. Lawrence. The ocean coast line, though of limited extent, is by far the most important in the United States. The greater part of the sea coast is on Long Island—a low, sandy coast, the seat of numerous summer resorts and of some fishing. The mainland, opposite the western end of Long Island, is traversed by the lower Hudson and other channels—submerged valleys—which form a branching bay with several islands, the largest of which are Staten and Manhattan Islands. This bay makes an excellent protected harbour, with 600 mi. of water front, at the outlet of the chief natural highway from the east to the interior of the country.

Climate.—In general the climate of New York is typical of that of northern United States, a climate of extremes, hot in summer, and cold in winter, and yet healthful, stimulating, and, on the whole, not disagreeable. The average mean annual temperature is not far from 45° though it varies from over 50° near New York city, and 48° near the Lake Erie shore, to less than 40° in the high Adirondacks. The average maximum summer heat is about 93°, a temperature of 100° being rarely reached. In the winter the temperature descends below zero during exceptionally cold spells. Most of the rivers and smaller lakes freeze over completely in winter. The average rainfall is between 40 and 45 in. but it is less than 30 in. in the Lake Champlain valley and more than 55 in. north of New York city. In the Adirondack region the snowfall is heavy, the winter long and severe. In central New York it is not uncommon for snow to accumulate to the depth of 3 or 4 ft. and yet this is not persistent. About New York city, and on Long Island, the snow rarely exceeds 1 ft. in depth. The climate is variable because of the frequent passage of cyclonic storms from the west and southwest, bringing warmer weather with rain and snow in winter, and causing days of great heat and humidity, with thunderstorms, in summer. About New York city, and on Long Island, the ocean softens the rigours of winter, and through the influence of cold surface waters off the coast, tempers the heat of summer.

Soil.—The soil is mostly glacial drift, but its depth and composition often vary greatly even within small areas. The most widely distributed soil, especially in the west half of the state, is mainly a clay which was formed by the glacial pulverizing of limestone and shale and is still forming from the decomposition of fragments of these substances. In the larger valleys and along the shores of lakes alluvium is mixed with this clay.

History.—The aboriginal inhabitants of New York had an important influence on its colonial history. Within its limits from the upper Hudson westward to the Genesee river was the home of that powerful confederacy of Indian tribes, the Mohawks, Oneidas, Onondagas, Cayugas and Senecas, known to the French as the Iroquois and to the English as the Five (later Six) Nations. When supplied with firearms by Europeans they reduced a number of other tribes to subjection and extended their dominion over most of the territory from the St. Lawrence to the Tennessee and from the Atlantic to the Mississippi. They were at the height of their power about 1700. Of much less influence in New York were several Algonkin tribes in the lower valley of the Hudson and along the sea coast.

Colonial Period.—New York bay and the Hudson river were discovered by Giovanni da Verrazano in 1524; for many years following, French vessels occasionally ascended the Hudson to trade with the Indians. In July 1609 Samuel de Champlain discovered the lake which bears his name and on its shores led his Algonkin Indian allies against the Iroquois, thus provoking against his countrymen the hostility of a people who for years were to hold the balance of power between the English and the French in America. On Sept. 3, 1609, Henry Hudson, in the employ of the Dutch East India company, entered New York bay in the "Half Moon" in search of the "northwest passage." He conceived that a vast trade with the Iroquois for furs might be established. His report aroused great interest in Holland, and the United Netherlands claimed the newly discovered country. In 1610 a vessel sailed with merchandise suitable for traffic with the Indians, the voyage resulted in profit, and a lucrative trade in peltries sprang up. Early in 1614 Adriaen Block explored Long Island sound and discovered Block Island. The merchants of Amsterdam and Hoorn soon formed themselves into the New Netherland company, and on Oct. 10, 1614, received from the states-general a three years' monopoly of the Dutch fur trade in New Netherland; *i.e.*, that part of America between New France and Virginia or between latitudes 40° and 45° N. Late in 1614 or early in 1615 a stockaded trading post called Fort Nassau was erected on Castle Island, now within the limits of Albany, and a few huts were raised on the southern extremity of Manhattan Island; but no effort at colonization was as yet made. When the charter of the New Netherland company expired in 1618, renewal was refused, and only private ventures were authorized until 1621. When the West India company was first chartered for a term of 24 years, it was given a monopoly of Dutch trade with the whole American coast and authorized to plant colonies and to govern them under a very limited supervision of the states-general. In June 1623, however, New Netherland was formally erected into a province and the management of its affairs assigned to the chamber of Amsterdam, which in March 1624 dispatched the "New Netherland" with the first permanent colonists (30 families, mostly Walloon), under Cornelis Jacobson Mey, the first governor or director of the colony. Arriving at Manhattan early in May, a few of the men remained there, but more than one-half of the families proceeded up the Hudson to Fort Orange, and there founded what is now Albany. Three more vessels arrived in 1625, and when in that year Mey was succeeded as director by William Verhulst the colony had a population of 200 or more. The government of the province was fully established in 1626 and was vested mainly in a director-general and council. Peter Minuit, the first director-general, arrived with more colonists in May 1626, and soon afterward Manhattan Island was bought from the Indians, Fort Amsterdam was erected at its lower end and the settlement there was made the seat of government.

In 1629, mainly to promote agriculture, the company issued its famous charter of privileges and exemptions, which provided tha'

any member might have anywhere in New Netherland except on Manhattan Island his choice of a tract of unoccupied land extending 16 mi. along the seacoast or one side of a navigable river, or 8 mi. along the river on both sides "and so far into the country as the situation of the occupyers will permit" by purchasing the same from the Indians and planting upon it a colony of 50 persons, within four years from the beginning of the undertaking, and that any private person might with the approval of the director-general and council take up as much land as he should be able to improve. The founder of a colony was styled a patroon, and, although the colonists were bound to him only by a voluntary contract for specified terms, the relations between them and the patroon during the continuance of the contract were in several important respects similar to those under the feudal system between the lord of a manor and his vassals. The single colony of Rensselaerwyck, established by Killian van Rensselaer on both sides of the Hudson and extending in all directions from Fort Orange (Albany), was the only one that prospered under the patroon system. Director-General Minuit was recalled in 1632 on the ground that he had been partial to the patroons; and Wouter van Twiller, who arrived in 1633, tried to promote only the selfish commercial policy of the company; at the close of his administration (1637) the affairs of the province were in a ruinous condition.

William Kieft was appointed director-general late in 1637, and in 1638 the company abandoned its monopoly of trade in New Netherland. The director-general was instructed to issue to any immigrant applying for land a patent for as large a farm as he required for cultivation and pasturage, to be free of all charges for ten years and thereafter subject only to a quitrent of one-tenth of the produce. Two years later the charter of privileges and exemptions was revised to permit manufactures and extend the privileges of the original charter with respect to patroons to "all good inhabitants of the Netherlands"; the estate of a patroon was limited to four miles along the coast or a navigable river and eight miles back into the country. These inducements encouraged immigration from the fatherland, New England and Virginia. But the freedom of trade promoted dangerous relations with the Indians, and an attempt of Kieft to collect a tribute from the Algonkins in the vicinity of Manhattan Island and other indiscretions provoked Indian hostilities (1641–45), during which most of the outlying settlements were laid waste.

Out of this warfare arose an organized movement for a government in which the colonists should have a voice. In 1641 Kieft frustrated an attempt of a board of 12 men to attain some reforms, and in 1644 a board of 8 sent a petition to the states-general for his recall, and this was granted. Peter Stuyvesant (*q.v.*), his successor, arrived at Fort Amsterdam in May 1647. Under his rule there was a return of prosperity; from 1653 to 1664 the population of the province increased from 2,000 to 10,000. Stuyvesant was, however, extremely arbitrary. Although he permitted the existence of a board of nine men to act as "tribunes" for the people, he treated it with increasing contempt.

Notwithstanding the good claim to their province which the Dutch had established, Great Britain, basing its claim to the same territory on John Cabot's discovery (1498), the patent to the London and Plymouth companies (1606), and the patent to the Council for New England (1620), contended that the Dutch were intruders, and by the treaty of Hartford (1650), the commissioners of the United Colonies of New England forced Stuyvesant to agree to a boundary which on the mainland roughly determined the present boundary between New York and Connecticut and on Long Island extended from Oyster bay to the Atlantic ocean. In 1653 the Dutch, fearing an English attack, built a wall, from which the present Wall street was named, across Manhattan Island at what was then the northern limits of New Amsterdam. In March 1664 Charles II formally erected into a province the whole territory from the west side of the Connecticut river to the east side of Delaware bay together with the whole of Long Island and granted it to his brother James, the duke of York and Albany, as its lord proprietor. The duke named Col. Richard Nicolls governor, in command of an expedition to conquer it. Nicolls won the burgomaster of New Amsterdam and other prominent citizens by offering favourable terms, and Stuyvesant was forced, without fighting, into a formal surrender on Sept. 8. The duke's authority was proclaimed; New Netherland became New York and Fort Orange became Fort Albany. A treaty of alliance procured for the English the same friendly relations with the Iroquois that the Dutch had enjoyed. The transition from Dutch to English institutions was effected gradually and the private rights of the Dutch were carefully preserved. The introduction of English institutions into settlements wholly or largely English was begun in 1665 by the erection of Long Island, Staten Island and Westchester into an English county named Yorkshire, under a code known as the "Duke's Laws." It gave the freeholders of each town a voice in town government through the election of a board of eight overseers and a constable. The board sat as a court for the trial of small causes. Nicolls resigned the governorship in 1668, but his successor, Francis Lovelace, continued his policy—autocratic government, arbitrary in form but mild in practice, and progressive in the matter of religious toleration.

In Aug. 1673, Holland and England being at war, a Dutch fleet surprised and captured New York, restored Dutch authority and names. But the treaty of Westminster, Feb. 1674, extinguished the Dutch title, and in November the English again took possession. In 1675 Gov. Edmund Andros established at Albany a commission for Indian affairs which long rendered important service in preserving the English-Iroquois alliance. Some of Andros' many enemies preferred charges against him and he was called to England in 1681 to answer these. During his absence the demand for a representative assembly was accompanied by a refusal to pay the customs duties and so much other insubordination that the duke appointed Col. Thomas Dongan to succeed Andros and call the desired assembly. It met in New York city on Oct. 17, 1683, and in about three weeks passed 15 acts. The first, styled a charter of liberties and privileges, required that an assembly elected by the freeholders and freemen should be called at least once every three years; vested all legislative authority in the governor, council and assembly; forbade the imposition of any taxes without the consent of the assembly; and provided for religious liberty and trial by jury.

The king, trying to strengthen the imperial control over New England and to erect a strong barrier against the French, in 1688 consolidated New York, New Jersey and the New England colonies into the dominion of New England under the viceregal authority of Sir Edmund Andros as governor general. News of the English revolution of 1688 caused an uprising in Boston, and in April 1689 Andros was seized and imprisoned. His fall encouraged restless spirits in New York city and on Long Island to act on their own. A German merchant, Jacob Leisler (*q.v.*), became their leader On May 31, 1689, the militia captains seized Fort James and Leisler assumed command later. In June Francis Nicholson, the lieutenant governor, deserted and sailed for England, and Leisler easily gained possession of the city. He called an assembly which conferred upon him the powers of a dictator. Following receipt of the order of William and Mary to continue all Protestants in their offices in the colonies, Leisler falsely announced that he had received a commission as lieutenant governor. Albany recognized him only when it was necessary to present a united front against the French and their Indian allies who, in Feb. 1690, had surprised and burned Schenectady. French attacks had at the same time been directed against New England, and to meet the dangerous situation Leisler performed his one statesmanlike act, notable in American history as the first step toward colonial union. At his call, delegates from Massachusetts, Plymouth, Connecticut and Maryland met in New York city with delegates from New York on May 1, 1690, to consider concerted action against the enemy, although the expedition which they sent out was a failure. Later Leisler was enraged when he learned that he had been ignored in the appointment of the new governor, Col. Henry Sloughter. Leisler refused to give up the fort, and after some bloodshed was arrested and executed.

Governor Sloughter, as his commission directed, re-established in 1691 the assembly which James II had abolished in 1686, and throughout the remainder of the colonial era the history of the

province relates chiefly to the rise of popular government and the defense of the northern frontier. In 1706 the assembly won the right to appoint its own treasurer to care for money appropriated for extraordinary purposes, and in 1737 the custom of continued revenue acts was replaced by annual appropriations.

In 1733 a popular organ, the *New York Weekly Journal*, was established under John Peter Zenger (1697–1746), and in 1735 both the freedom of the press and a great advance toward the independence of the judiciary were the outcome of a famous libel suit against Zenger. He was arrested for libel in Nov. 1734 for printing criticisms of the administration. The jury quickly agreed on a verdict of not guilty, and the acquittal was greeted by the populace with shouts of triumph. The further independence of judges became a leading issue in 1761 when the assembly insisted that they should be appointed during good behaviour, and refused to pay the salaries of those appointed during pleasure; but the home government met this refusal by ordering that they be paid out of the quitrents.

The defense of the northern frontier was a heavy burden to New York, but by its problems the growth of the union of the colonies was promoted. The main effort of the French, however, was, by diplomacy, to destroy the English-Iroquois alliance. To counteract the influence of French priests dwelling among the Iroquois the English, in 1701, prevailed upon the chiefs to deed their territory, said to be 800 mi. in length and 400 mi. in breadth, to the king of England. The English, also, frequently distributed presents. But the success of the French at the close of the 17th century and the early portion of the 18th was prevented only by the ceaseless efforts of Peter Schuyler (1657–1724) whose personal influence was for years dominant among all the Iroquois except the Senecas. When they had assumed a neutral attitude, he persuaded a number of them to join troops from New York, New Jersey and Connecticut in the unsuccessful expeditions of 1709 and 1711 against the French at Montreal. In order to regulate the trade with the Iroquois, Gov. William Burnet established a trading post at Oswego in 1722 and fortified it in 1727 and thereby placed the Iroquois in the desirable position of middlemen in a profitable fur trade with the "far Indians." In King George's War New York was left alone to protect its own frontier and while the assembly was wrangling with Gov. George Clinton for the control of expenditures the French and their Indians were burning farmhouses, attacking Saratoga (Nov. 17, 1745), and greatly endangering the English-Iroquois alliance. A reconciliation was effected, however, by Col. (later Sir William) Johnson (*q.v.*), a former agent of Indian affairs. Largely to secure the cooperation of the Iroquois the home government itself now called the most important assembly of colonial deputies that had yet gathered to meet at Albany (*q.v.*). This body, consisting of 23 commissioners and representing seven colonies, met in June 1754, and, besides negotiating successfully with the Iroquois, it adopted, with some modifications, a plan of colonial union prepared by Benjamin Franklin; the plan was not approved, however, either by the home government or by any of the colonies. In the first year of the French and Indian War (1755) Maj.-Gen. William Johnson defeated a French and Indian force under Baron Ludwig Dieskau in the battle of Lake George. In Aug. 1756 marquis de Montcalm took Oswego from the English and destroyed it, and in 1757 he captured Fort William Henry; but in the latter year the elder William Pitt assumed control of affairs in England, and his aggressive, clear-sighted policy turned the tide of war in England's favour. Victory followed victory, Ticonderoga, Crown Point and Niagara were wrested from the French and New York was freed of its foes.

The Revolutionary War.—England's attempt to make the colonies pay the expenses of the war by means of the stamp tax thoroughly aroused the opposition of commercial New York, already chafing under the hardships imposed by the Navigation acts and burdened with a war debt of its own exceeding £300,000. The assembly authorized its committee, which had been appointed to correspond with the New York agent in London, to correspond also with the committees in the other colonies and this committee represented New York in the Stamp Act congress, which met in New York city in Oct. 1765. In the series of events which followed important changes were made in party lines. The court party and propertied classes became the Loyalist party, standing for law as against rebellion, monarchy and the union of the empire as against republicanism; the popular party became the Patriot party, determined to stand on its rights at any cost. The Stamp act was repealed in March 1766, but the Townshend acts were met in New York by fresh outbursts of the Sons of Liberty and by an association of merchants, the members of which pledged themselves not to import anything from England until the duties were repealed. New York had also been requested to provide certain supplies for the British troops quartered in the city. This the assembly refused to do but parliament answered (1767) by forbidding it to do any other business until it complied. It was under these conditions that the Loyalists, in the elections of 1768 and 1769, gained control of the assembly and in the latter year passed an act granting the soldiers' supplies. The moderate Loyalists joined in the election of delegates to the first continental congress; but the great body of Loyalists in New York strongly disapproved of the "dangerous and extravagant" measures adopted by that body, and the assembly, in Jan. 1775, refused to approve its acts or choose delegates to the second continental congress. The Patriots met this refusal by calling a provincial convention to choose the delegates. Scarcely had they done this when news of the encounter at Lexington produced a strong reaction in their favour, and in May 1775 they called a provincial congress which usurped the powers of the assembly. Still, conditions were such in New York that a fight for independence was not to be lightly considered. In the south the chief city was exposed to the British fleet, and the northern border was exposed to attack from the British and their Iroquois allies. In various sections, too, considerable numbers of Loyalists were determined to aid the British. When, in June 1776, a vote on the Declaration of Independence was pending in the continental congress, the New York provincial congress refused to instruct its delegates in the matter; but a newly elected provincial congress, influenced by a Loyalist plot against the life of George Washington, adopted the Declaration when it met, July 9.

It was a settled point of British military policy throughout the war to hold New York city, and from it, as a base, to establish a line of fortified posts along the Hudson by means of which communication might be maintained with another base on Lake Champlain. Such a scheme, if successfully carried out, would have driven a wedge into the line of colonial defense and cut off communication between New England and the southern colonies. A few days after the fight at Lexington and Concord, Connecticut authorized an expedition under Ethan Allen which surprised and captured Ticonderoga and Crown Point. In the following year (1776) the British began their offensive operations for the control of the Hudson. Sir William Howe, with a force of British and Loyalists vastly superior in equipment and numbers to Washington's untrained militia, landed in July on Staten Island and late in August defeated Washington at the battle of Long Island within the present limits of Brooklyn borough. In the following month Washington withdrew from New York city which the British entered and held until the close of the war. Washington prepared to withstand the British behind fortifications on Harlem Heights, but discovering that Howe was attempting to outflank him by landing troops in the rear he retreated to the mainland, leaving only a garrison at Fort Washington, and established a line of fortified camps on the hills overlooking the Bronx river as far as White Plains. This brought on the battle of White Plains late in October, in which Howe gained no advantage; and from there both armies withdrew into New Jersey, the British capturing Fort Washington on the way. In 1777 Gen. John Burgoyne succeeded in taking Ticonderoga, but in the swampy forests southward from Lake Champlain he fought his way against heavy odds, and in the middle of October his campaign culminated disastrously in his surrender at Saratoga. Col. Barry St. Leger led an auxiliary expedition from Oswego against Fort Stanwix on the upper Mohawk, and on Aug. 6 he fought at Oriskany one of the most bloody battles of the war, but a few days later, deserted by his terror-

stricken Indian allies, he hastened back to Montreal. Early in October Howe sent an expedition up the Hudson under the command of Sir Henry Clinton. Clinton met with little difficulty from the principal American defenses of the highlands, consisting of Forts Montgomery and Clinton on the western bank, together with a huge chain and boom stretched across the river to a precipitous mountain (Anthony's Nose) on the opposite bank, and ascended as far as Esopus (now Kingston) which he burned, but he was too late to aid Burgoyne. The year 1778 saw the bloody operations of the Tory Butlers and their Loyalist and Indian allies in the Mohawk and Schoharie valleys and notably the massacre at Cherry valley. In retaliation a punitive expedition under Generals John Sullivan and James Clinton in 1779 destroyed the Iroquois towns, and dealt the Indian confederacy a blow from which it never recovered. The American cause was strengthened this year also by several victories along the lower Hudson of which Gen. Anthony Wayne's storming of the British fort at Stony Point was the most important. The closing episode of the war as far as New York was concerned was the discovery of Benedict Arnold's attempt in 1780 to betray West Point and other colonial posts on the Hudson to the British. On Nov. 25, 1783, the British forces finally evacuated New York city, but the British posts on Lakes Erie and Ontario were not evacuated until several years later.

Post-Revolutionary Period.—New York ratified the Articles of Confederation in 1778, and was the first state to surrender any claims to territory west of the Mississippi. Led by George Clinton, governor in 1777–95, the state jealously guarded its commercial interests. This led to determined opposition to the new federal constitution. In support of the constitution, however, there arose the Federalist party under the able leadership of Alexander Hamilton. When a majority of the Constitutional Convention of 1787 had approved of the new constitution, Hamilton alone of the three New York delegates remained to sign it; and when, after its ratification by eight states, the New York convention met at Poughkeepsie (June 17, 1788) to consider ratification, two-thirds of the members were opposed to it. But others were won over by the news that it had been ratified by New Hampshire and Virginia or by the telling arguments of Hamilton, and on July 26 the motion to ratify was carried by a vote of 30 to 27.

The constitution having been ratified, personal rivalry among the great families—the Clintons, the Livingstons and the Schuylers—again dominated political affairs. The Livingstons, piqued at Washington's neglect to give them the offices they thought their due, joined the Clintons, but the federal patronage was used against the Anti-Federalists or Republicans with such effect that in 1792 John Jay received more votes for the governorship than George Clinton, although the latter was counted in on a technicality. Jay was elected in 1795 and re-elected in 1798, but in 1801 the brief Federalist regime in the state came to an end with the election of George Clinton for a seventh term. The Republican leaders straightway quarrelled among themselves, thus starting the long series of factional strifes which have characterized the party politics of New York state. The leaders of the several Republican groups were Chancellor Robert R. Livingston, Aaron Burr, then vice-president, Gov. George Clinton and his nephew, De Witt Clinton, who in 1802 was elected United States senator. The first break came in the spring of 1804 when Burr, who had incurred the enmity of his Republican colleagues in 1800 by seeking Federalist votes in the electoral college at Jefferson's expense, became an independent candidate for the office of governor against Morgan Lewis. Hamilton's action in counselling Federalists not to vote for Burr, just as he had counselled them not to support Burr against Jefferson in 1800, was one of the contributory causes of Burr's hostility to Hamilton which ended in the duel (July 1804) in which Burr killed Hamilton. Hamilton's death marked the end of the Federalists as a power in the state. New York, whose growing shipping interests had suffered by the embargo of 1807, was as a commercial state opposed to the War of 1812 with Great Britain. Politically this opposition had the effect of temporarily reviving the Federalist party, which secured control of the legislature, and gave the electoral vote of the state in 1812 to De Witt Clinton, whom the Federalists had accepted as a candidate to oppose Madison for re-election on the war issue. During the war New Yorkers served with the regular troops at Niagara, Plattsburg and other places on the western and northern frontiers of the state. For several years after the war political contests in New York state as in the rest of the country were not on party lines. De Witt Clinton was elected governor and, largely through his efforts, the Erie canal was begun.

The election of Martin Van Buren as governor in 1828 marked the beginning of the long ascendancy in the state of the "Albany Regency," a political coterie in which Van Buren, W. L. Marcy, Benjamin Franklin Butler (1795–1858) and Silas Wright were among the leaders. Thurlow Weed, their bitterest opponent and the man who gave them their name, declared of them that he "had never known a body of men who possessed so much power and used it so well." Thurlow Weed owed his early political advancement to the introduction into state politics of the anti-Masonic issue (*see* ANTI-MASONIC PARTY), which also brought into prominence his co-worker W. H. Seward. As the anti-Masonic wave subsided, its leaders and most of its adherents found a place in the newly organized Whig party which was powerful enough in New York to elect William H. Seward governor in 1838, and to re-elect him and to carry the state for W. H. Harrison against Van Buren in 1840. It was during the first administration of Governor Seward that the antirent agitation in the Hudson river counties began. Vast estates in Albany, Rensselaer, Columbia, Schoharie, Delaware, Sullivan and other counties were the seats of disturbance. Besides rent, many of the tenants were required to render certain services to the proprietor, and in case a tenant sold his interest in a farm to another he was required to pay the proprietor one-tenth to one-third of the amount received as an alienation fine. Politically, the antirent associations which were formed often held the balance of power between the Whigs and the Democrats, and in this position they secured the election of Gov. John Young (Whig) as well as of several members of the legislature favourable to their cause, and promoted the passage of the bill summoning the constitutional convention of 1846. In the new constitution clauses were inserted abolishing feudal tenures and limiting future leases of agricultural land to a period of 12 years. The courts pronounced the alienation fines illegal. Under the pressure of public opinion the great landlords rapidly sold their farms. Up to the election of Seward as governor, New York had usually been Democratic, largely through the predominating influence of Van Buren and the "Albany Regency." After the defeat of Gov. Silas Wright in 1846, however, the Democratic party split into two hostile factions known as the "Hunkers," or conservatives, and the "Barnburners," or radicals. The factions had their origin in canal politics, the conservatives advocating the use of canal revenues to complete the canals, the radicals insisting that they should be used to pay the state debt. Later when the conservatives accepted the annexation of Texas and the radicals supported the Wilmot proviso the split became irrevocable. Only once between 1846 and the Civil War did the Democratic party regain control of the state—in 1853–55 Horatio Seymour was governor for a single term. A succession of Republican governors then held office until 1862 when discouragement in the north with respect to the Civil War brought a reaction which elected Seymour governor.

With the exception of New York city the state was loyal to the Union cause during the war and furnished more than 500,000 troops to the federal armies. Certain commercial interests of New York city favoured the Confederate cause, but Mayor Fernando Wood's suggestion that the city (with Long Island and Staten Island) secede and form a free city received scant support, and after the sanguinary draft riots of July 1863 (*see* NEW YORK [CITY]), no further difficulty was experienced.

Post-Civil War Period.—After the Civil War the state began to reassume its pivotal position in national politics, and the high political tension emphasized the evils of the "spoils system." In 1868 John T. Hoffman, a favourite of Tammany Hall, was chosen governor on the Democratic ticket. Tammany and Hoffman were again victorious in 1870; but in 1871 the *New York Times* dis-

closed the magnitude of the "Tweed ring's" thefts, amounting in the erection of the New York county courthouse alone to almost $8,000,000, and William Marcy Tweed and his "ring" were crushed in consequence. The Republicans carried the state in 1872, but in 1874 Samuel J. Tilden, a Democrat and the leading prosecutor of Tweed, was elected governor. The Republican legislature had in 1867 appointed a committee to investigate the management of the canal system, but the abuses were allowed to continue until in 1875 Governor Tilden disclosed many frauds of the "Canal ring," and punished the guilty. In 1882 the Republicans, having split over a struggle for patronage into the two factions known as "Halfbreeds," or the Administration party, and "Stalwarts," of whom the leader was Roscoe Conkling, were defeated, and Grover Cleveland was chosen governor. Hostility to free silver and "Bryanism" in the large financial and industrial centres again put the state strongly in the Republican column in the state elections from 1894 to 1910.

Twentieth Century.—In the election of Nov. 1910 the Democrats carried not only the state but also the legislature, and John A. Dix was elected governor. The Democrats again carried the state and the legislature in Nov. 1912, and William Sulzer became governor.

In April 1913 Governor Sulzer sent a special message to the legislature urging a direct primary law that would abolish party conventions. The legislature refused to enact the primary bill, and the governor vetoed the legislative substitute. When the legislature recessed on July 23 the governor declared the special session adjourned, but the legislature reassembled on Aug. 11. Two days later the assembly voted to impeach the governor; on Oct. 17 he was removed from office and Martin H. Glynn, lieutenant governor, succeeded.

The Republicans were successful in the elections of Nov. 1914, and Charles S. Whitman became governor, and in 1916 was re-elected. In the November election, 1918, Alfred E. Smith (Democrat) was elected governor by a small plurality of about 15,000. Most of the other state officers and the legislature, however, remained Republican. One of the most important laws of the year provided for an income tax of from 1% to 3%. Shortly after his inauguration Smith appointed a nonpartisan reconstruction commission to investigate the problem of a fundamental reorganization of the state government, and to consider other important problems of reconstruction resulting as an aftermath of World War I. This commission recommended an executive budget and the consolidation of the numerous administrative agencies.

In 1920 the direct primary was abandoned and the convention system restored for the nomination of state and judicial officers. The 1922 legislature authorized life-insurance companies to invest 10% of their assets in new buildings for dwelling purposes; extended the emergency rent laws to 1924 and fixed assessments as the basis for determining the reasonableness of rents. Women were given representation on county party committees. A home rule amendment was adopted. The 1922 election resulted in the selection of Alfred E. Smith as governor by an absolute majority of 269,609 votes.

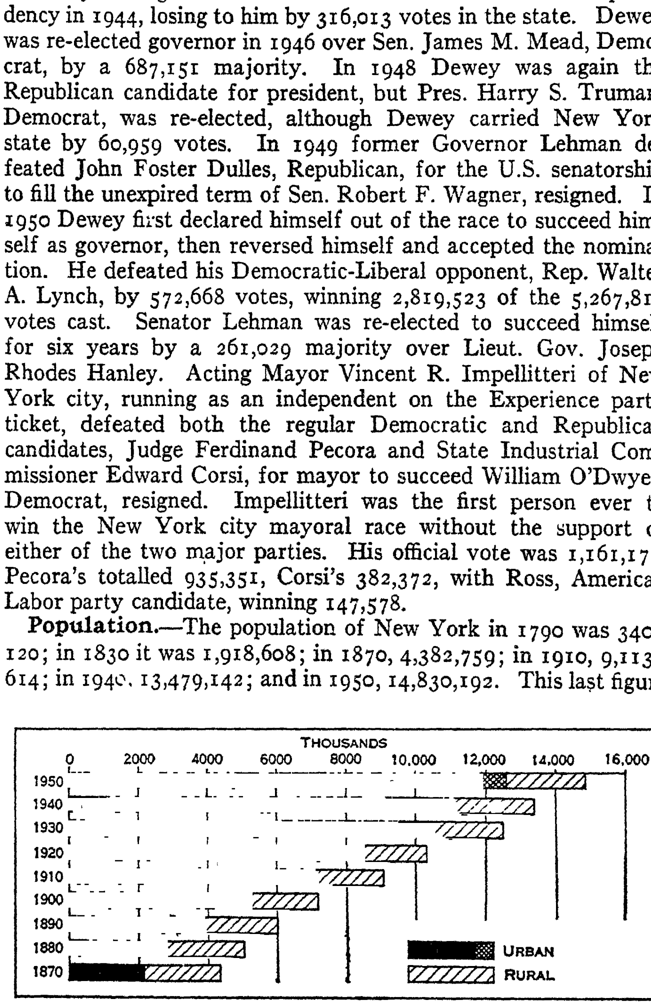
In the autumn elections (1923) the voters approved an amendment extending to cities a large measure of home rule. An important measure of the 1924 session of the legislature was the Home Rule Enabling act, designed to carry out the amendment. In 1924 Governor Smith was re-elected but the Republican candidates for the other six elective state offices were successful, and the legislature became more strongly Republican. In the fall election of 1925 the voters approved four constitutional amendments. The most important provided for the governor's plan of consolidating the numerous state administrative agencies into 19 departments. In 1926 the Democrats succeeded in re-electing Governor Smith though the legislature remained Republican. Again in 1928 they won the governorship for their candidate, Franklin D. Roosevelt. Herbert H. Lehman, another Democrat, was elected governor in 1932 and was re-elected in 1934, 1936 and 1938, the last time for a term of four years.

In 1942 Thomas E. Dewey, Republican, was elected governor. Legislation enacted by the Dewey administration, supported by a continuously Republican majority in the legislature, included laws providing: that employers could not discriminate against employees because of race, creed or colour; disability insurance for unemployed; a state youth commission to reduce juvenile delinquency; the school of industrial and labour relations at Cornell university; materially increased state aid to localities; increased slum clearance and low-rental housing; expanded health services with special attention to tuberculosis eradication and cancer and cerebral palsy clinics; a materially increased construction program for highways, state institutions and conservation projects; and a $400,000,000 bonus for veterans of World War II.

During World War II the state government acted through the state war council and other agencies to prepare the public for civilian defense, to increase the number of war material contracts awarded to manufacturers in the state, to train more than 1,000,000 war production workers and to set up agencies to handle agricultural, business and individual problems created by war's dislocations.

Dewey ran against Pres. Franklin D. Roosevelt for the presidency in 1944, losing to him by 316,013 votes in the state. Dewey was re-elected governor in 1946 over Sen. James M. Mead, Democrat, by a 687,151 majority. In 1948 Dewey was again the Republican candidate for president, but Pres. Harry S. Truman, Democrat, was re-elected, although Dewey carried New York state by 60,959 votes. In 1949 former Governor Lehman defeated John Foster Dulles, Republican, for the U.S. senatorship to fill the unexpired term of Sen. Robert F. Wagner, resigned. In 1950 Dewey first declared himself out of the race to succeed himself as governor, then reversed himself and accepted the nomination. He defeated his Democratic-Liberal opponent, Rep. Walter A. Lynch, by 572,668 votes, winning 2,819,523 of the 5,267,816 votes cast. Senator Lehman was re-elected to succeed himself for six years by a 261,029 majority over Lieut. Gov. Joseph Rhodes Hanley. Acting Mayor Vincent R. Impellitteri of New York city, running as an independent on the Experience party ticket, defeated both the regular Democratic and Republican candidates, Judge Ferdinand Pecora and State Industrial Commissioner Edward Corsi, for mayor to succeed William O'Dwyer, Democrat, resigned. Impellitteri was the first person ever to win the New York city mayoral race without the support of either of the two major parties. His official vote was 1,161,175. Pecora's totalled 935,351, Corsi's 382,372, with Ross, American Labor party candidate, winning 147,578.

Population.—The population of New York in 1790 was 340,120; in 1830 it was 1,918,608; in 1870, 4,382,759; in 1910, 9,113,614; in 1940, 13,479,142; and in 1950, 14,830,192. This last figure represented an increase of 10.0% over the population in 1940. The population per square mile in 1950 was 309.3, as compared with 281.2 in 1940, and with 50.7 for the U.S. in 1950.



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEW YORK: 1870 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

The urban area of New York in 1940 comprised all incorporated places of 2,500 or more plus 1 town (township) classified as urban under special rule. The population of this area was 11,165,893, or 82.8% of the state total. The population in 1950 of all incorporated places of 2,500 or more plus the 1 special-rule town was 11,889,008, or 6.5% more than in 1940, and represented 80.2% of the state total.

The entire urban population, under a new definition set up for 1950, which included also the thickly settled suburban area, or "urban fringe," adjacent to the 13 cities which had a population of 50,000 or more in 1940, and 18 unincorporated places of 2,500 or more outside this fringe, amounted to 12,682,446, or 85.5% of the state total.

The number of households in 1950 was 4,329,327, as compared with 3,662,113 in 1940.

The average population per household had declined from 3.7 in 1940 to 3.4 in 1950.

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40

*Final figures for 1950 based on new definition. *See* comment in text.

The population of the state was distributed by colour and nativity in 1950 as follows: 76.7% native white; 16.9% foreign-born white; and 6.4% nonwhite, practically all Negro. There were 95.4 males per 100 females in the 1950 population, as compared with 98.5 in 1940; 8.5% of the population was 65 years old or over; and 54.5% of the population 14 years old and over was in the labour force. Of the total number of employed males, 3.9% was engaged in agriculture, 7.3% in construction, 29.5% in manufacturing, 10.6% in transportation, communication and other public utilities, 21.6% in wholesale and retail trade and 20.2% in service activities of all kinds, including public administration.

Government.—Since becoming a state, New York has been governed under five constitutions, adopted in 1777, 1821, 1846, 1894 and 1938 respectively. The constitution of 1938 may be amended by a majority vote of the members of two successive legislatures and approval by the electorate.

Suffrage is bestowed on all citizens who have attained the age of 21 years and have been inhabitants of the state for one year, but for the protection of the ballot, citizenship for 90 days, residence in the county for four months and in the election district for 30 days next preceding the election are required. Prospective absentee voters must register in person before leaving the state, except for persons away on military service.

The executive and administrative department of New York state functions under a reorganization plan authorized by a constitutional amendment approved in Nov. 1925, and reapproved in Nov. 1938. Under this system there are 19 major departments to which have been allocated the duties of more than 180 commissions and bureaus. Only the governor, lieutenant governor, comptroller and attorney general are elected. They are elected quadrennially (in even-numbered years). The 19 state departments consist of the executive department, the departments of audit and control, taxation and finance, law, state, public works, conservation, agriculture and markets, labour, education, health, mental hygiene, social welfare, correction, public service, banking, insurance, civil service and the department of commerce.

The governor submits to the legislature, not later than Jan. 15 (except in the case of a newly elected governor, when the date is extended to Feb. 1), a budget containing a complete plan of proposed expenditures and estimated revenues for the next fiscal year. The budget also contains recommendations of the governor for new taxes, loans or other appropriate actions to meet any estimated deficiency for the ensuing fiscal year which runs from April 1 to March 31 of the following year. A bill that has been vetoed by the governor can become law only with the approval of two-thirds of the members elected to each house of the legislature. The salaries of the governor and of the lieutenant governor are $25,000 and $10,000 respectively. The legislative power is vested in a senate of 56 members and an assembly of 150 members, each chamber elected biennially. Since the year 1846 both senators and assemblymen have been elected by single districts, and ever since the state government was established they have been apportioned according to population, but the constitution of 1938 limited the representation of New York city in the senate by declaring that no county shall have more than one-third of all the senators, nor any two adjoining counties more than one-half of them. The legislature meets in annual sessions, beginning on the first Wednesday in January. Money bills may originate in either house, but at the final vote on such a bill in either house three-fifths of the members elected to that house must be present and the yeas and nays must be recorded; bills entailing appropriations for local or private purposes must receive a two-thirds majority to pass. The legislature appoints the board of regents of the University of the State of New York. The judicial system comprises a supreme court of 127 justices, four appellate divisions of the same, a court of appeals, a court of claims and local courts. The highest judicial court in the state is the court of appeals which consists of a chief judge and six associate judges elected from the state at large for a term of 14 years. Its jurisdiction is limited, except where judgment is of death, to a review of questions of law. Vacancies are temporarily filled from among the justices of the supreme court by the governor. To expedite business, at the request of the court, the governor may designate not more than four justices of the supreme court to act temporarily as additional associate judges of the court of appeals. The salary of the chief judge is $28,500, of the associate judges $28,000 a year. The justices of the supreme court are elected for 14 years from the ten districts into which the state is divided. The jurisdiction of each justice extends over the entire state. Vacancies are temporarily filled by the governor. The supreme court has general jurisdiction in law and equity, including both civil and criminal actions. The salary of each justice is $18,000 except in the 1st, 2nd and 9th districts where $10,000 more is raised from local sources. Presiding judges receive an additional $2,500 and all assigned to appellate work an extra $2,000. The state is divided into four departments for each of which there is an appellate division consisting of seven justices each in the 1st and 2nd departments and five each in the others. The justices and presiding justices are designated from among the justices of the supreme court by the governor; the presiding justice and a majority of the other justices of each department must be residents of the department. The court of claims consists of six judges, one presiding, appointed by the governor for a term of nine years. It has jurisdiction to hear and determine private claims against the state. New York city (*q.v.*) has an extensive judiciary system of its own.

Of the 19 department heads, 17 are appointed by the governor and confirmed by the senate. The commissioner of education and the commissioner of social welfare are appointed respectively by the board of regents and the board of social welfare. Salaries for the 19 vary from $15,000 to $20,000 a year.

Local Government.—The state is divided into 62 counties, each (unless wholly included in a city) having a county board of supervisors elected for two years, one from every town or city ward. This board has certain administrative and legislative powers. Other county officers are a county judge and a county surrogate elected for a term of six years, except in New York and Kings counties where the term is 14 years, a treasurer, a clerk, a district attorney, a sheriff and from one to four coroners elected for a term of three years. Cities are of three classes, those having a population of: (1) 175,000 or more; (2) between 50,000 and 175,000; and (3) less than 50,000. The classification is according to the latest state enumeration. All city elections are held in odd-numbered years. The organization of cities and villages is provided by the legislature, which may restrict their powers of

taxation and of contracting debts and may fix salaries. Town (or township) government in New York somewhat resembles that of New England; the chief executive officer of the town is a supervisor, who represents his town in the county "board of supervisors."

Finances.—The aggregate assessed value of real property in the state on June 30, 1949, was $28,396,149,141, which under the system of assessment represented an actual value of more than $30,528,000,000. The assessed valuation was $2,644,128,000 greater than that of 1940. For many years the state levied an annual tax on real estate. In 1925 it yielded $28,460,190, but was soon after abolished. It was levied for the last time in 1928, when it yielded only $12,666,314 out of total receipts of more than $330,000,000 for that year. Special taxes were for years the chief source of revenue, but after 1928 they were virtually the only source. The total receipts of the state for the year ending March 31, 1950, were $857,354,503, and the total appropriations by the legislature amounted to $866,438,840. Of state receipts, $366,-202,625 went to state purposes and $491,151,877 to local assistance purposes. Receipts from the principal special taxes were: personal income, $262,915,861; corporations, $193,452,285; motor vehicles and motor fuel, $167,116,004; alcoholic beverages and licences, $64,584,159; cigarettes, $56,388,910; estates, $22,155,-402; pari-mutuel, $26,571,524; utilities, $25,727,372; and stock transfers, $19,869,934. Bonded debt on April 1, 1950, was $681,-013,685.

In 1851 a state banking department was created, and at the head of this is a superintendent of banks. The superintendent—or examiner appointed by him from a civil service list—is required to examine every bank, trust company and other financing institution within the state, national banks excepted. At the end of 1949 there were 773 banks in the state. The deposits in all these institutions were $41,919,595,235. The total resources were $46,-800,670,576. The 130 savings banks held deposits of $11,105,358,-361 and their assets totalled $12,326,940,063.

Education.—The first school was established by the Dutch at New Amsterdam (now New York city) as early as 1633, and at the close of the Dutch period there was a free elementary school in nearly every settlement. King's college was founded in 1754; and from 1704 to 1776 the other schools were principally those maintained by the Society for the Propagation of the Gospel in Foreign Parts. Hardly any schools remained in operation throughout the Revolutionary War. In 1784 the legislature established a state university of which Columbia college, formerly King's, was the "mother" portion. In 1787 a second university law restored to Columbia college the substance of its original charter and made the University of the State of New York an exclusive executive body with authority to incorporate new colleges and academies and to exercise over them the right of visitation. The functions of the university were extended to include an oversight of the professional, scientific and technical schools, the administration of laws relating to admission to the professions, the charge of the state library at Albany, the supervision of the local libraries, the custody of the state museum and the direction of all scientific work prosecuted by the state. In 1812 a separate system for common schools was established. This dual system was consolidated by the Educational Unification act of 1904, in conformity with which the university regents became a legislative body, subordinate to the state legislature, for determining the general educational policy of the state. The commissioner of education acts as the chief executive, advisory and supervisory officer of the whole educational system.

The regents of the university are chosen by the legislature, one retiring each year; and an act of 1909 requires that their number shall at all times be three more than the number of judicial districts. All elementary and secondary schools outside of cities and villages are under the general control of district superintendents. Two or more contiguous school districts may unite to form a central school district, to provide improved and diversified educational facilities, elementary and secondary, for all children in the merged districts.

The total public-school enrolment in 1949 was 1,944,676; 1,316,940 in 5,159 elementary schools; 137,833 in 162 junior high schools; and 489,903 in 831 high schools. Enrolment in 1,110 private and parochial schools totalled 463,104. In the 114 colleges and universities, 261,045 were enrolled.

In 1948 the legislature established the State University of New York, operating almost autonomously but legally responsible to the board of regents. This university assumed responsibility for all state-financed institutions of higher education, including 11 state teachers' colleges, at Albany, Brockport, Buffalo, Cortland, Fredonia, Geneseo, New Paltz, Oneonta, Oswego, Plattsburg and Potsdam; the state colleges of agriculture, home economics and veterinary at Cornell university (*q.v.*); of forestry and medicine at Syracuse university; the college of medicine at Brooklyn; Champlain college at Plattsburg; Triple Cities college at Endicott; the New York State Maritime college at Fort Schuyler; the school of industrial and labour relations at Cornell; the six agricultural and technical institutes; and the five institutes of applied arts and sciences established on an experimental basis for five years in 1946.

Among the larger institutions of higher learning in the state, besides Columbia university (*q.v.*), New York city, and Cornell university (*q.v.*), Ithaca, are: Rensselaer Polytechnic institute, Troy; New York university, New York city; Fordham university, New York city; City college, New York city; University of Rochester, Rochester; Polytechnic Institute of Brooklyn, Brooklyn; Niagara university, Niagara University; St. Bonaventure university, St. Bonaventure; Long Island university, Brooklyn; Manhattan college, New York city; St. John's university, Brooklyn; Canisius college, Buffalo; Syracuse university, Syracuse; Adelphi college, Garden City; Clarkson College of Technology, Potsdam; Hofstra college, Hempstead; Pratt institute, Brooklyn; Rochester Institute of Technology, Rochester; Siena college, Loudonville; University of Buffalo, Buffalo; Cooper union, New York city; Hunter College of the City of New York; and Brooklyn college, Brooklyn. The U.S. Military academy (1802) is at West Point.

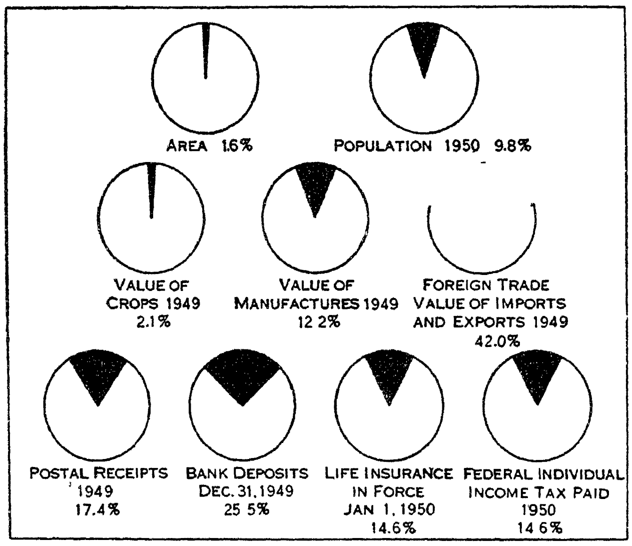
Charities and Corrections.—Penal institutions are under the supervision of the department of correction; schools for mental defectives and hospitals for the insane, except for the criminal insane, are under the supervision of the department of mental hygiene; and all other charitable and correctional institutions, maintained wholly or in part by the state, except the state camp for veterans at Bath which is under the control of the executive department, are under the supervision of the department of social welfare. Heading the department of corrections is the commissioner of correction. The division of parole, a branch of the executive department, consists of five members appointed by the governor for terms of six years each. The duties of visitation and inspection are vested in a commission of correction composed of seven members appointed by the governor and confirmed by the senate. The institutions under this department in 1950 included: Attica prison at Attica; Auburn prison at Auburn; Clinton prison at Dannemora; Great Meadow prison at Comstock; Green Haven prison at Green Haven; Sing Sing prison at Ossining; Walkill prison at Walkill; hospitals for the criminal insane at Dannemora and Matteawan; a reformatory at Elmira; a training school at Albion; a reformatory for women and the Westfield state farm at Bedford Hills; institutions for defective delinquents at Napanoch and Woodburne; a vocational institution at West Coxsackie.

At the head of the department of mental hygiene is the commissioner of mental hygiene. In 1950 the department of mental hygiene had supervision over the following institutions: state schools for mental defectives at Newark, Rome, Syracuse, Thiells, Wassaic; the Craig colony (epileptics) at Sonyea; hospitals for insane at Binghamton, Brooklyn, Buffalo, Central Islip, Helmuth, Wingdale, Poughkeepsie, Kings Park, New York city, Middletown, Rochester, Ogdensburg, Utica, Queens Village, Marcy, Brentwood, Orangeburg and Willard; a psychiatric institute at New York city and a psychopathic hospital at Syracuse.

The state department of social welfare consists of a state board of social welfare of 15 members, one member from each of the nine

judicial districts and six additional members for the state at large, all appointed by the governor with the consent of the senate for a term of five years. The board appoints the commissioner of social welfare. In 1950 the state charitable institutions were as follows: state training school for girls, Hudson; state agricultural and industrial school, Industry; Thomas Indian school, Iroquois; State Woman's Relief Corps home, Oxford; and the Training School for Boys at Warwick. The State Tuberculosis hospital at Raybrook; the State Rehabilitation hospital at West Haverstraw; tuberculosis hospitals at Oneonta and Mount Morris; the State Institute for the Study of Malignant Diseases at Buffalo, the Hermann M. Biggs Memorial hospital at Ithaca; the Onondaga sanatorium at Syracuse; Broadacres sanatorium at Utica and the J. N. Adam Memorial hospital at Perrysburg are under the control of the department of health. Facilities for educating the blind are provided by the state school for the blind at Batavia and by private institutions where pupils are maintained on a per capita basis. The deaf and dumb are educated in private institutions. Such pupils as are appointed by the commissioner of education are maintained by the state.

Agriculture.—In spite of its large urban population and its prominence as an industrial area, New York state stood 11th among the 48 states in 1949 in the value of its agricultural products. Gross sales of farm products in 1949 totalled $841,561,000. Federal government payments in 1949 comprised an additional $4,475,000. The dairy industry, including the production of milk



RELATIVE IMPORTANCE OF NEW YORK STATE IN CERTAIN ASPECTS OF THE NATIONAL LIFE

and cream and meat from cattle, accounted for more than half the gross total. The sale of milk and cream in 1949 totalled $348,032,000. Principal farm products in 1949 and the quantities produced were: milk, 8,708,000,000 lb.; eggs, 2,324,000,000; corn, 29,610,000 bu.; potatoes 30,660,000 bu.; apples, 20,090,000 bu.; oats, 22,591,000 bu.; wheat, 11,760,000 bu.; hay, 4,878,000 tons; onions, 6,205,000 sacks.

Harvested acreage in 1949 totalled 6,396,000, exclusive of land devoted to orchards and vineyards. Livestock and poultry on farms on Jan. 1, 1950, were valued at $440,168,000 and included 1,483,000 head of milch cows, 145,000 horses, 2,000 mules, 212,000 hogs, 178,000 sheep and 17,759,000 chickens. In 1949 farms in the state raised 809,000 turkeys. The value of land and buildings of all farms in the state in 1945 was $1,087,522,090 and of implements and machinery, exclusive of automobiles, $239,291,278.

The character of New York state farming is determined largely by the demands of urban areas for milk and poultry products, fruit and vegetables. Specialties for which the state is famous include wines from central New York, ducklings and oysters from Long Island, cheeses from northern New York, table grapes from the Hudson valley and apples from the Hudson and Champlain valleys and from the Lake Ontario area. Before prohibition in 1920, the Schoharie valley was famous for its hops, but this industry was not revived there following repeal in 1933.

Mining.—New York is seldom considered an important state in the production of minerals, yet since 1880 it has been the leading producer of talc in the nation and of gypsum in the world. It is the only state producing emery and wollastonite, and at Gore mountain in the Adirondacks has maintained the world's largest mine for producing garnet for abrasives. New York is the leading producer of salt for domestic, industrial and chemical uses, from huge beds underlying the central part of the state.

Because of the rapid drain upon the deposits of richer iron ore in the Mesabi region of Minnesota, New York state's beds of iron ore (magnetite, Fe_3O_4) began in the early 1940s to assume importance in the economy of the state and as a source of high-grade iron ore for the nation. The principal deposits exploited have been in the Adirondacks. In 1948, 7,865,937 long tons of magnetite ore were mined, valued at $24,384,648.

New York also became the nation's principal source of titanium in 1940. This is mined at Sanford lake near Tahawus in the Adirondacks. Magnetite is a by-product. The titanium oxide (TiO_2) is separated from the iron at the mine. Titanium oxide is used as a nondarkening pigment for white paint. At mid-century, industrial uses for metallic titanium were being developed because of its light weight in structurally strong alloys. Zinc mining is also under expansion in northern New York.

In 1948, the production of minerals in New York state attained a value of $156,140,000. The principal minerals, excepting iron, contributing to this total are shown in the following table:

Mineral	Production	Value
Portland cement	12,299,226 bbl.	$26,071,417
Crude gypsum	1,228,358 short tons	3,294,973
Lead	1,231 "	440,698
Natural gas	4,705,000,000,000 cu.ft.	1,040,000
Petroleum	4,621,000 bbl.	22,975,000
Salt	3,065,831 short tons	13,056,542
Sand and gravel	16,369,303 "	13,382,370
Limestone	11,140,000 "	14,367,974
Zinc	34,566 "	9,194,556
Talc	119,716 "	2,613,935
Titanium concentrates	*	*
Silver	18,788 troy ounces	17,004
Miscellaneous		29,808,161

*Figures withheld.

Other minerals produced in appreciable proportions include diatomite, feldspar, garnet (abrasive), lime, graphite, slate, granite, marble and wollastonite.

After 1945, aerial, magnetic surveys located large, new deposits of magnetite in the northern Adirondacks. Several steel companies began to conduct intensive surveys by borings in the area.

Manufactures.—The establishment of a great highway of commerce through the state from New York city to Buffalo by the construction of the Erie canal, opened in 1825, and later by the building of railways along the line of the water route, made the state's manufactures quite independent of its own natural resources. Thus it happens that from Buffalo to New York city there is a chain of busy manufacturing centres; but away from the great natural route of commerce New York manufacturing and the density of population decrease. In these areas, farming and resort business prevail.

New York state has ranked first in the union in the value of its manufactures since 1830, and this value rose to $21,700,000,000 in 1949. The manufacture of clothing, begun in New York city about 1835, is not only the city's chief product but is also the principal product of the state. Buffalo, the city second in manufactures, produces flour, iron and steel products, industrial chemicals, rubber and electronic products and motor vehicles. Rochester, the city third in manufactures, is first among the cities of the United States in the manufacture of photographic materials and apparatus, optical instruments and men's clothing. Niagara Falls and New York city manufacture a large part of the chemicals. Other prominent manufacturing cities are Albany, Binghamton, Schenectady, Syracuse, Troy, [illegible].

The ten leading manufactures in New York state in 1947, rated by value added by manufacture and listing their employee totals, were:

Manufacture	Value added by manufacture	Number of employees
Apparel	$2,009,000,000	382,486
Printing and printing products	1,128,000,000	166,492
Food products	977,000,000	135,296
Primary metals	830,000,000	165,858
Machinery (except electrical)	679,000,000	137,556
Chemicals	596,000,000	69,066
Electrical machinery	459,000,000	101,861
Textile-mill products	429,000,000	89,803
Paper and paper products	374,000,000	65,026

There were an estimated 580,000 business firms of all kinds and sizes in 1950, with 5,502,800 nonagricultural employees. Average factory earnings of workers in 1949 were $57.47 a week. During World War II, manufacturers in New York state produced total goods valued at $23,048,000,000 on war contracts, leading every other industrial state for the period.

Transport and Commerce.—From the very beginning of the occupation of New York by Europeans, commerce was much encouraged by the natural watercourses. The Erie canal was opened to boats of about 75 tons burden in 1825. The Champlain canal, connecting the Erie with Lake Champlain, was completed in 1823. The Oswego canal, connecting the Erie with Lake Ontario, was begun in 1825 and completed in 1828. Several other tributary canals were constructed during this period, and between 1836 and 1862 the Erie was sufficiently enlarged to accommodate boats of 240 tons burden. In 1918, the Barge canal was completed, incorporating the earlier canals and providing navigation for barges of 1,000 tons burden. Total canal and navigable river mileage in 1950 was 800.

The first railway in the state and the second in operation in the United States was the Mohawk and Hudson, opened from Albany to Schenectady in 1831. The first great trunk line in the country was that of the Erie railway, opened from Piermont, on the Hudson river, to Dunkirk, on Lake Erie, in 1853. The New York Central railway, nearly parallel with the water route from New York city to Buffalo, was formed by the union, in 1869, of the New York Central with the Hudson River railway. In 1886 the New York Central Railroad company leased the West Shore railway for a term of 475 years, and this company operates another parallel line from Syracuse to Buffalo, a line following closely the entire north border of the state, and several crosslines. Other important railways are the Lehigh Valley, the Delaware, Lackawanna and Western, and the Pennsylvania in the central and western sections, the Delaware and Hudson, the Rutland, the Boston and Maine, the Central New England and the New York, Ontario and Western in the east, and the Long Island on Long Island. In 1950 the operated mileage of the 41 railroads in New York was 7,639. In the same year there were 86,552 mi. of highways, 66,013 mi. of which were classified as improved and 14,300 mi. under state control.

In 1948, construction of a 535-mi., multiple-lane motor "Thruway" was begun, to connect New York city, via Albany, to Buffalo and the western edge of the state. Airport development progressed after World War II to provide 259 airports and 62 seaplane bases in 1950. Air traffic in 1949 included 66,039 tons of air cargo and 4,341,000 passengers.

The port of New York city is the greatest port in the world. Approximately 50% by value of the exports from the U.S. and imports into it pass through the New York customs district.

Retail trade of the state in 1949 was estimated at $13,365,-097,000. Income payments to all individuals in that year totalled $26,346,000,000.

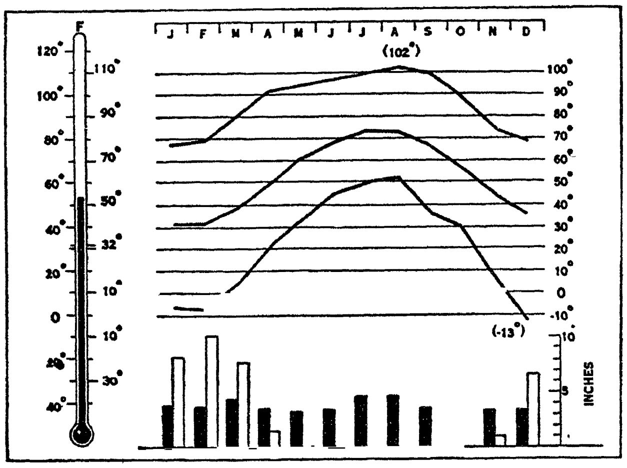
(A. E. SM.; A. R. T.)

NEW YORK (CITY), the largest city in the United States, is situated at the mouth of the Hudson river, there sometimes called the North river. The five boroughs comprising the city are: the Bronx (Bronx county), 41.4 sq.mi., on the southeasternmost part of the mainland adjoining Westchester county and separated from the borough of Manhattan by the Harlem river (a canalized waterway connecting the Hudson and East rivers); Manhattan (New York county), 22.3 sq.mi., on Manhattan Island between the Hudson and East rivers; Queens (Queens county), 118.6 sq.mi., adjoining Nassau county and separated from the Bronx and Manhattan by the East river; Brooklyn (Kings county), 81 sq.mi., on the western end of Long Island; and Richmond (Richmond county), 57 sq.mi., on Staten Island southwest of Brooklyn and separated from it by the Narrows (a strait connecting Upper and Lower bays) and from the mainland of the state of New Jersey by tidal estuaries known as Kill van Kull and Arthur Kill. The city hall, near the southern end of Manhattan Island, is in lat. 40° 42′ 43″ N., and long. 74° 0′ 29″ W. The greatest width of the city, east and west, is 24 mi. and the greatest length, northeast and southwest, is 35 mi. The land area is 320.3 sq.mi. The city's more important small islands are: North and South Brother, Riker's, City, Hunter, Hart, Governor's (occupied by a U.S. military reservation), Welfare (formerly Blackwell's), Ward's, Randall's (the latter three occupied by state and city institutions) and numerous islands in Jamaica bay. Bedloe's Island (on which stands the F. Bartholdi Statue of Liberty) and Ellis Island (occupied by the federal government as

an immigrant station) are in Upper bay, within the bounds of New Jersey.

The total water front is 578 mi., of which Manhattan has 43 mi.; Brooklyn, 201 mi.; the Bronx, 80 mi.; Queens, 197 mi.; and Richmond, 57 mi.

In 1626 there were fewer than 200 inhabitants, 1,000 in 1656, and but 14,000 in 1760. About 1783 New York began its rapid growth as the leading port. Between 1786–96 the population had nearly doubled, and by 1871 it was 1,000,000. In 1898 five boroughs were united to form greater New York. In 1920 the total population was 5,620,048; in 1940, 7,454,995; in 1950, it was 7,891,957, divided as follows: Manhattan 1,960,101; the Bronx 1,451,277; Brooklyn 2,738,175; Queens 1,550,849; Richmond 191,555. This was an increase of 6% in the decade 1940–50. Almost every national and racial group in the world is represented among the people in the city.



WEATHER GRAPH OF NEW YORK CITY. THE THERMOMETER INDICATES NORMAL ANNUAL MEAN TEMPERATURE. THE CENTRE CURVE SHOWS NORMAL MONTHLY MEAN TEMPERATURE; THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED IN EACH MONTH. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION; THE SHADED COLUMN, TOTAL PRECIPITATION (INCLUDING MELTED SNOW); THE WHITE COLUMN, SNOWFALL

The Negro population (458,444 in 1940) had for years been centred in the Harlem district, roughly between 110th street on the south and 150th street on the north, in an area bounded on the east by Fifth avenue and on the west by St. Nicholas avenue. The sharp growth in Negro population after 1940, coupled with an immigration of about 300,000 Puerto Ricans (the new economic and social marginal group) into the east Harlem and Bronx slum areas, led to movements of Negroes into areas in Brooklyn, the Bronx and Queens which formerly had only a small Negro population, and in Manhattan to a broadening and lengthening of the Harlem district. The Chinese quarter is in the neighbourhood of Chatham square, on Mott, Pell and Doyers streets. The city of New York has more Jews than any other city, the estimates ranging in 1950 from 1,800,000 to 2,000,000. The Jewish population has tended to centralize in Brooklyn and the Bronx.

Important changes in the distribution and concentration of population occurred during 1940–50. Queens, relatively sparsely populated in 1940, increased its population by 19.2%, with one area, Flushing, whose birth rate increased 144%, showing a gain of more than 50%. The declines in population in the old marginal slum areas that sprouted in the centre of industrial sections of Brooklyn, and in the Brownsville and Bushwick districts almost counterbalanced gains in other areas so that Brooklyn's population increased by only 0.7%. The Bronx's population showed a similar pattern of declines in the older areas and growth in the new less-crowded areas, with a net gain of 3.6%. Manhattan, the most densely populated borough in the city, increased its population by 2.5%; the relatively high income area in mid-Manhattan, bounded by Central park on the east and the Hudson river on the west, showed the largest gain, 5.6%. The lower east side, once the home of most of New York's foreign-born, increased by 5.5%. The latter gain was caused by the rapid growth of new housing developments and their occupation by younger people whose higher fertility rates accounted for an increase in birth rate of 116% since 1940.

The New York metropolitan district, as defined by the U.S. census bureau, includes 17 counties in New York and eastern New Jersey (19 counties including a part of Connecticut were included in 1940). This land area had a population of 12,911,994 according to the 1950 census. In addition to New York city, it includes such important centres of industry and population as Newark, Paterson, Elizabeth, Bayonne, Hoboken, Passaic, Union City, East Orange, Perth Amboy, Orange and New Brunswick in New Jersey; and Yonkers, Mount Vernon, New Rochelle and White Plains in New York.

HISTORY

New York bay and the Hudson river were probably first discovered by Giovanni da Verrazano, an Italian navigator, in 1524, and seen also by Estéban Gómez, a Portuguese, in 1525. It is commonly stated that the first competent exploration of New York bay and its environs was made by Henry Hudson in the "Half Moon" in Sept. 1609. But there is in Paris a map dated 1570 which shows in considerable detail the topography near the mouth of the Hudson. In 1611 Adriaen Block came to Manhattan Island and returned to trade for furs with the Indians. In 1614 he explored the harbour of Manhattan and its adjacent waters and was probably the first European to enter Long Island sound. The states-general of Holland granted a charter to the New Netherland company giving it the exclusive right to trade in New Netherland for four voyages, to be made within three years from Jan. 1, 1615. In 1615 the company built a storehouse and fort on the south end of Manhattan and a few huts sprang up around it. On Jan. 1, 1618, the charter expired. In June 1623 New Netherland was formally established as a province of the West India company. The next year a party of about 30 Protestant Walloon families arrived. Of these colonists only about eight men remained on Manhattan, the remainder going to establish Fort Orange where Albany now is. The next year more colonists came, and when Director Mey gave way to Director Verhulst, the colony numbered almost 200 persons. The government of the New Netherland province was vested in a director-general and a council. These officers, though formally appointed by the company, were subject to the approval of the states-general. The first director-general, Peter Minuit, arrived with additional colonists in 1626, purchased Manhattan Island from the Indians with pieces of bright cloth, beads and other trinkets to the value of 60 guilders or about $24, erected Fort Amsterdam at the lower end of the island, and made New Amsterdam the seat of government. Wouter van Twiller, who succeeded him in 1633, was recalled in 1637 because of his mismanagement. Under the wise rule of Peter Stuyvesant (*q.v.*) the province prospered and, at the time of the transfer of New Netherland to English control, the population stood at about 10,000 (*see* NEW YORK [STATE]: *History*). In 1658 Stuyvesant established a "rattle watch" of eight men which may be called New York's first police force. The strife between the English and Dutch went on until 1664, when Col. Richard Nicolls took possession of the city without bloodshed on Sept. 8, 1664. The English flag was raised over the fort, which was renamed Fort James, and New Amsterdam became New York.

The rights of the Dutch settlers were carefully maintained at first, and established institutions changed only gradually. The English reorganized the city government (1665) with a mayor, aldermen and sheriff to be appointed by the governor of the province for a term of one year, and also extended the city limits to include all of Manhattan Island. The Dutch reoccupied the city from July 30, 1673, to Nov. 9, 1674, when Colve surrendered to Sir Edmund Andros, the new English governor. Andros restored the English form of city government. The next 100 years is in the main a record of continuous struggle for control of the

city government between the royal agents and the inhabitants. There were good and bad governors, but none was capable of stemming the tide of popular demand for greater freedom of self-determination. The first serious break in English resistance came with the refusal of the merchants of New York and other parts of the province to pay certain duties exacted by the "Duke's Laws." Gov. Thomas Dongan called the first New York assembly on Oct. 17, 1683, and to this body freemen were permitted to elect representatives. Dongan's regime is notable also for "Dongan's charter," which was granted the city in April 1686 and whereby sources of income were vested in the city corporation, all previous rights and privileges being confirmed and conveyed to the corporation, including the proprietorship of the city hall, the market houses, bridges, wharves, docks, cemeteries, ferries, unoccupied lands and the waters within the city. The city seal presented to the corporation the same year is that which it now employs with its motto *Sigillum Civitatis Novi Eboraci,* except that an eagle was substituted for the royal crown in 1784. Under the rule of Jacob Leisler (1689–91) the people were permitted, for the first time, to elect their own mayor, Peter de Lanoy, a privilege that lapsed until 1834. Henry Sloughter, Leisler's successor, appointed as mayor Abraham DePeyster, a young, cultured and popular man of irreproachable character. He was effective in conciliating the warring factions, and responsible for many public improvements. The old "rattle watch" or police of the city was reorganized by DePeyster in 1697, and placed again under civil control. DePeyster built new wharves, provided the first system of poor relief and instituted sanitary betterments. Business prospered in spite of the unrest in the province as a whole. Pirates in and about New York were a source of constant irritation, and Gov. Benjamin Fletcher, who had succeeded Sloughter, was even suspected of being in league with them. They were finally dispersed by Lord Bellomont, Fletcher's successor, and a measure of confidence in the government restored. But the incompetence of governors Lord Cornbury and Francis Lovelace increased resentment against English government; and its appointed mayors, though in the main men of good standing, were so frequently changed that none except William Peartree (1703–09) made noticeable impressions upon municipal affairs. Peartree established the first free grammar school and a school for Negro slaves. He also improved the jail and provided a debtor's prison in the city hall. Gov. Robert Hunter, a cultured gentleman, who took office in June 1710, was more tactful than his predecessors; but his regime was ten years of turmoil. In April 1712 insurgent Negroes massacred nine white men and wounded many more. Twenty-one Negroes were legally executed, some in a most barbaric manner, and many others, innocent as well as guilty, were imprisoned. Broadway was graded from Maiden lane to the commons, under Mayor Caleb Heathcote, and a new Presbyterian church was built.

By the middle of the 18th century New York city was regarded as the focal point of resistance to royal authority. A majority of its leading citizens were descendants of the Dutch patroons, intelligent men and women who, though loyal to the English government, were fully aware of its incompetency in America. Gov. George Clinton, who returned to England in 1753 after a stormy rule of ten years, turned over the government to Sir Danvers Osborn on Oct. 7. The next day, Osborn's body was found hanging in the garden of his home. Chief Justice James DeLancey took oath as lieutenant governor and became acting governor. On Oct. 31, 1754, DeLancey signed the charter of King's college (now Columbia university, *q.v.*), which had been established in 1753 in the vestry room of Trinity church. News of the capture of Quebec by James Wolfe in 1759 was hailed in New York with great enthusiasm. Causes of resentment against English rule were soon supplied by the imprisonment of New York sailors by British men-of-war in the very harbour of the city. When copies of the Stamp act reached New York it was denounced by the newspapers. On Oct. 7, 1765, the Stamp Act congress was called at the city hall, with representatives from all provinces. While the congress was still in session on Oct. 23, a British ship arrived loaded with stamps, and in the face of the resistance of the people the fort prepared itself for defense. On Nov. 1, 1765, a band of the Sons of Liberty hanged Gov. Cadwallader Colden in effigy at the very door of the fort, and then burned the houses of several prominent officials. Mayor John Cruger finally induced Colden to turn over the stamps to the city corporation; but the Sons of Liberty were firm in their resistance to the enforcement of the Stamp act and it was finally repealed on March 18, 1766. New York went wild with excitement and the Sons of Liberty on June 4 erected a liberty pole in the "Fields" (City Hall park), where a replica now stands. Rioting between the Sons of Liberty and the British soldiers was of almost daily occurrence and finally, in 1770, Mayor Whitehead Hicks issued a proclamation forbidding soldiers to leave the barracks unless accompanied by an officer. The liberty pole, which had been erected and cut down several times, was finally put up on the commons and inscribed "Liberty and Property." But with the arrival of Sir William Tryon as governor, in July 1771, it became apparent almost at once that the temporary peace would shortly end. News that a tea ship was on its way to New York to carry out Lord North's purposes of taxation was received with violent expressions of defiance throughout the city. The Sons of Liberty reorganized to stir up resistance. When the ship reached New York, on April 7, 1774, its landing was refused, a few chests of tea were thrown into the bay by a committee of the Sons of Liberty previously appointed and the ship sent home to England. The closure of the port of Boston was the signal for the calling of a meeting at Fraunces' tavern and the election of a committee of 51, which issued the call for the first congress of the Colonies. The committee of 51 was dissolved with the election of a new committee of observation to enforce in New York the Nonimportation act of the first congress. From this time on events moved swiftly. On April 23, 1775, news of the battle of Lexington reached New York. A mob took possession of city hall and seized munitions stored there. Two British ships in the harbour were seized and their cargoes unloaded. The committee of 60 called for the election of a new committee of 100 to arrange for calling a war congress of deputies from all New York counties. The provincial congress met in New York and declared obedience to the Continental Congress, while reserving their right of internal control. On June 25 Gen. George Washington arrived in New York with his staff on the way to Boston and the same day Governor Tryon returned from England. Each was received with official ceremony, but Washington's reception as he passed up Broadway was an ovation. On April 4, 1776, New York was put under military rule by Gen. Israel Putnam, and batteries were installed along the East river and other strategic points. On the evacuation of Boston, Washington moved his headquarters to New York. The news of the Declaration of Independence came to New York on July 9, 1776, and was read to the soldiers who immediately thereafter tore down the equestrian statue of George III in Bowling Green, an act denounced by Washington in the next day's general orders. On July 12 Adm. Richard Howe appeared with his fleet in the harbour, but not until Aug. 22 were troops landed at Gravesend bay. On Aug. 27 the advance of British troops toward the American lines on Brooklyn heights was begun, and by 2 o'clock the same day the heights were taken by the British. On the evening of the 29th Washington withdrew all his troops from Long Island without interference and reorganized in New York. The British then undertook to cut off the American army, on Sept. 15, by throwing a line of troops across Manhattan at about 34th street. But the Americans got to Harlem heights, where Washington again reorganized. On Sept. 16, the British attacked unsuccessfully at Harlem heights. About a week later, a fire broke out at Whitehall slip and almost completely destroyed the lower part of the city. Trinity church was burned but St. Paul's and King's college were miraculously saved by a shifting of the wind. On this same evening Nathan Hale, a spy for the American army, was captured on Long Island and tried in New York by Gen. William Howe. He admitted that he was a spy and was condemned and hanged at a spot near 45th street and First avenue. New York was held by the British troops for the remainder of the war. During British occupancy, it was used largely as a prison camp. Churches, warehouses, jails and stores were packed with men sick and well. On the site of the fire, a village of huts and tents had

sprung up which was called "Canvas Town," and occupied by bandits and "roughs." Robberies were a daily occurrence and citizens could expect no relief from the British soldiers. In Wallabout bay, on the East river, an old hulk, the "Jersey," was used by the British as a prison ship and there more than 11,000 men died. The city was in desperate straits for want of supplies, and sickness ravaged the people. There was no government except military rule, and the oppression of civilians by the soldiery was the cause of frequent riots. Justice was not to be had and the revenues of the city corporation were appropriated by the military for their private uses. After the surrender of Lord Cornwallis at Yorktown, however, Sir Guy Carleton, a humane and honest officer, succeeded the intolerant Sir Henry Clinton in May 1782, and immediately undertook the restoration of law and order. By the time of the evacuation, Nov. 25, 1783, confidence in government was in a fair way to restoration.

The parting of Washington with his troops came on Dec. 4, 1783, at Fraunces' tavern. After the departure of Washington, James Duane was appointed mayor by Gov. George Clinton. Business slowly revived with freedom from restrictions of trade. King's college, by act of legislature, May 1, 1784, became the state university, and its name was changed to Columbia college. At this time, the population of the city was about 24,000. Congress made New York the capital. On April 30, 1789, Washington was inaugurated at Federal hall at the corner of Broad and Wall streets, and a day of celebration followed. There was still intense feeling against the loyalists, but commercial interests soon erased the memories of personal conflict. The rise of commerce and wealth drew many people to New York, and it began to take on the appearance of a metropolis. As capital, the city was continually gay with festivities, public and private. But on Aug. 12, 1790, Washington made his last official visit to Federal hall and went to the new capital, Philadelphia. Edmond Charles Genet, on his arrival with the secret purpose of embroiling the U.S. in a war with England, was received in New York at first with great enthusiasm but, with his recall, interest in French affairs grew cool. Men were too busy with their own affairs. Since 1786 the population had doubled and new streets and public utilities had been laid out. Collect pond, later the site of the Tombs (city prison), was the scene of the first trials of John Fitch's steamboat in 1796. New York ceased to be state capital in 1797. On July 11, 1804, the death of Alexander Hamilton in his duel with Aaron Burr threw the city into mourning and Burr was so execrated he left in the night of July 21. This year the New York Historical society was founded. With the help of Mayor DeWitt Clinton and of several of the founders of the society, there was organized, in 1805, the Society for Establishing a Free School in the City of New York. Under Clinton schools were built and Columbia college improved, philanthropic organizations increased in number, and arts and letters were stimulated. In 1807 there were 19 newspapers, of which 8 were dailies. Although the Embargo act of that year struck New York trade a serious blow, it was not without benefit in stimulating home industry. Finally, the Non-intercourse act relieved the situation somewhat. The city hall was completed in 1812, and there was at this time a very considerable advance both in architecture and building construction. Many new buildings, chiefly churches, were built, new streets were graded and swamps were filled in along the water front. Collect pond was filled in and the hills and valleys of lower Manhattan were rapidly levelled for homes and other structures. In the midst of this prosperity, war was declared against Great Britain. The toll exacted from New York was tremendous; the burning of Washington, D.C., by the British resulted in a great concentration of troops in New York. New fortifications were thrown up along the water front and the old ones strengthened. But on Feb. 11, 1814, the ship "Favorite" arrived at New York under flag of truce with British and American messengers and the treaty of peace. A jubilee followed and Sunday was a day of fervent thanksgiving. New York was then transformed almost overnight. DeWitt Clinton was again mayor, and under his guidance the services of government were everywhere improved. Cadwallader D. Colden succeeded Clinton and likewise advanced all governmental and private services for public welfare. Great numbers of immigrants from Europe arrived and the problems of dealing with this great mass of new residents taxed the city to its limits. Yellow fever broke out in 1819, 1822 and 1823, and hundreds died daily until the epidemics were checked with the coming of cold weather; others occurred ten years later with similar loss of life, but the city continued to grow with amazing rapidity. The opening of the Erie canal on Nov. 4, 1825, began a three days' celebration. At this date, the modern history of New York begins.

Under Mayor Philip Hone (1826) fine dwellings, public buildings and mercantile establishments multiplied; wealth increased and the continuing influx of immigrants made evident the need for greater educational opportunities. The University of the City of New York was established in a splendid new building opened in 1835. There were now more than 200,000 people in the city, and transportation was a pressing problem, only partly solved by the horse-drawn street cars. Another great fire broke out below Wall street on Dec. 16, 1835, and the succeeding months saw great distress. Croton water was furnished the city July 4, 1842. Blackwell's (now Welfare) Island, purchased in 1828 for $50,000, was made the site of the city's correctional institutions and hospitals. The *New York Sun*, whose issue by Benjamin H. Day was begun in 1833, sold for a penny. The *Herald* of James Gordon Bennett appeared in 1835, the *Tribune* of Horace Greeley in 1841, Henry J. Raymond's *Times* in 1851. The theatre was thriving, business was rapidly spreading uptown, and Union square was the residential centre. Beyond Union square, there was little but open fields at the middle of the century. The World's fair at the Crystal palace on Murray Hill was the outstanding event of 1853; in 1856 Central park was purchased. But in 1857 business was paralyzed, thousands thrown out of work, and more than 900 merchants failed; riots and disturbances of all kinds ensued. The same year, the state legislature laid the basis for the modern metropolitan police force, and a new regime of law and order was begun. The city recovered quickly from the depression of 1857, and at the outbreak of the Civil War was again thriving; it authorized a loan of $1,000,000 for defense of the Union, and hundreds of thousands more were privately pledged. New York was again filled with soldiers. Rioting broke out in July 1863 as a protest against army drafts and for five days there was turmoil. More than 50 buildings were burned and several hundred people killed or wounded. Mayor George Opdyke, in 1863, reported that the people of New York had contributed up to that time $300,000,000 for war purposes, and had furnished more than 80,000 men. During the war, the establishment of schools, scientific and literary associations, libraries, museums, and clubs went on apace, and at its end New York was still able to find resources for great public works. Brooklyn bridge was begun in 1870, and sanitary conditions, which in 1865 had been thoroughly studied by a citizens' committee and found deplorable, were on their way to betterment. New public improvements opened fresh opportunities for graft by public officials. Under the Tammany mayor, A. Oakey Hall, in 1872, a gigantic conspiracy for looting the city, known as the "Tweed ring," was exposed by the *New York Times* and a citizens' committee. The thefts of the ring ran into hundreds of millions, the graft in the erection of the county courthouse alone amounting to about $8,000,000. "Boss" William Marcy Tweed and many of his followers were tried and sent to prison, and Tweed died there. Then followed a reform administration, but in 1874 Tammany regained control. The corporate limits of the city were extended in 1874 to include about 13,000 ac. across the Harlem river, in the Bronx, and in 1895, a still further extension in the same county was made which brought the city limits to the southern boundaries of Yonkers and Mount Vernon. In this same year, Col. George E. Waring, representing a reform administration under Mayor William L. Strong, was made commissioner of street cleaning and with his "white wings" inaugurated the modern system of street cleaning and refuse collection. The city was still further increased in 1898 by the annexation of Kings, Richmond and a part of Queens counties, and a new charter was enacted for the greater New York. During all this period of administrative

reconstruction, Tammany hall continued the great political power, although occasionally defeated for the mayoralty. In 1897 Tammany again got control of the mayor's office by the election of R. A. Van Wyck, but was defeated in 1901, because of its abuse of power. Seth Low, a reform mayor, served during 1902 and 1903 when Tammany regained control. During the next 30 years Tammany generally maintained its political power. Mayors George B. McClellan (1904–10) and William J. Gaynor (1910–13) were both elected by Tammany and both were able men and strove to give the city good government, even under the handicaps of the Tammany political system. In Mayor McClellan's administration, however, a citizens' civic agency, the New York Bureau of Municipal Research (organized in 1906), disclosed and published a report on irregularities in the administration of the office of Borough President Ahearn of Manhattan. Mayor McClellan appointed as a special counsel John Purroy Mitchel, who secured sufficient evidence of these irregularities to warrant Gov. Charles Evans Hughes in removing Borough President Ahearn for incompetency. In Mayor Gaynor's administration, a police lieutenant was arrested, tried and later found guilty of complicity with gangsters in the murder of a New York merchant, who was on the point of making disclosures of police corruption to the district attorney. Mayor Gaynor, wounded in an attempt upon his life, failed in health and died Sept. 10, 1913, almost at the end of his term. The police scandals of Gaynor's administration swung popular sympathy against Tammany, and John Purroy Mitchel, candidate for mayor on a "fusion" ticket, was elected and took office in 1914. In Sept. 1914 a special aldermanic committee of investigation undertook a complete survey of police administration and methods. The facts finally brought out by this committee furnished clear evidence of police incompetency and corruption. Mayor Mitchel's administration from 1914 to 1918 was regarded as exceptionally efficient because of the administrative reforms which he instituted.

Yet in the next election Mitchel was defeated by an overwhelming vote, and John F. Hylan, another Tammany mayor, took office in 1918, on a platform of outspoken repudiation of the Mitchel administration. Mayor Hylan held office for two terms during which time there was continuous wrangling among the superior officers of administration to the extent that little of importance for the city's betterment was accomplished. One of the outstanding features of government in the period covered by the administrations of Gaynor, Mitchel and Hylan was the enormous increase of budget from $163,130,270.37 in 1910 to $345,530,039.77 in 1921. In 1925, Mayor Hylan, denounced by many of his own Tammany supporters, was refused party support, and James J. Walker, a representative of the "new Tammany," who had made a good record in the state senate, received the Democratic nomination. He was well supported by Gov. Alfred E. Smith who was everywhere recognized as the actual leader of Tammany hall, and, without much opposition from the Republicans, Walker was elected with the endorsement of a great popular vote. The great issues of the Hylan administration, rapid transit and subway fares, continued paramount under the new mayor without, however, reaching a satisfactory solution. In 1932 Walker was summoned before Gov. Franklin D. Roosevelt to answer charges of graft brought by Samuel Seabury, counsel for the Hofstadter committee; and failing to halt these proceedings for his removal, he chose to resign from office. After an interim under Joseph V. McKee (Sept. 1–Dec. 31, 1932) and John P. O'Brien, during which the city's credit became badly strained, a reform candidate on a fusion ticket, Fiorello LaGuardia, was elected mayor in 1933 and re-elected in 1937 and 1941. The LaGuardia administration was marked by such events as the unification of the transportation system under city operation, the completion of the Triborough bridge and Lincoln tunnel and Queens Midtown tunnel, development of the Delaware water supply system and the World's fair of 1939 and 1940. The wave of civic regeneration set in motion by the Seabury investigations was carried forward by District Attorney Thomas E. Dewey and John H. Amen, with a series of political and gangster prosecutions and convictions. Though Tammany hall strengthened its shattered position with each election, the voters were twice given an opportunity, in 1936 and 1938, to vote on proportional representation and each time voted in its favour.

LaGuardia did not run for re-election in 1945, and William V. O'Dwyer, a Democrat, former patrolman, district attorney and military government officer with the rank of brigadier general was elected mayor.

O'Dwyer proved a generally vigorous and effective administrator and political leader though not always equally popular. The notable achievements of his administration included an extensive building program, with great emphasis on schools, hospitals, traffic speedways and public housing, in connection with which more than $1,000,000,000 was spent or committed during his term of office. As a result of these greatly increased facilities and generally rising costs, O'Dwyer brought in the largest annual budget in the history of the city, exceeding $1,250,000,000 for the year 1950–51. The mayor also instituted a far-reaching program of administrative reform, creating the executive committee on administration in his own office, composed of top career administrators; the division of analysis in the bureau of the budget, a management survey unit; corresponding methods analysis units in 24 of the major city departments; and finally the mayor's committee on management survey. This committee was composed of 29 members including the city's chief financial official, the elected comptroller, as chairman, the deputy mayor and several other career city employees, a number of business and professional leaders, representatives of organized labour and the presidents or secretaries of leading civic organizations. This committee was authorized to initiate extensive management surveys, utilizing leading firms of consultants and engineers. Approximately $2,000,000 was earmarked for this purpose when the work was initiated in March 1950, with the expectation that the project would be completed in 1952.

Among the major political issues of the period were the abolition of proportional representation as a means of electing the 25 city councilmen and the consequent reduction of the opposition and reform element of the council to a minority of one.

Other notable political decisions involved the adoption of a ten-cent fare for the transit system (July 1948), the acceptance of collective bargaining with subway unions, the refusal to deal with so-called "Communist unions," the transfer of the city's airports to the Port of New York authority on a 50-year lease and the sharp increase of salary rates for top elected officers which placed the mayor at $40,000 per year, the comptroller at $30,000 and the president of the city council and the five borough presidents at $25,000.

The first serious water shortage in the history of the city, during the winter, spring and summer of 1949–50, resulted in vigorous conservation measures, the use of harbour water for street flushing, the construction of an emergency pumping plant designed to use Hudson river water and the stimulation of construction to increase the water supply from upland sources.

O'Dwyer was re-elected to office in Nov. 1949, but resigned on Sept. 1, 1950, to accept the less strenuous assignment as United States ambassador to Mexico. He was succeeded under the charter by the president of the city council, Vincent R. Impellitteri, a regular Democrat who, running as an "independent," was elected mayor in the special election of Nov. 1950 without Tammany nomination and support.

Impellitteri appointed a new commissioner of police to stamp out police connections with gambling as disclosed by the district attorney's investigations in Brooklyn, and a new commissioner of fire to reorganize the fire department. He replaced the chairman of the city planning commission, but otherwise appeared to be continuing the general policies and programs of the prior administration. (R. B. F.; L. Gu.)

COMMERCE AND INDUSTRY

Harbour.—The port of New York has the greatest harbour in the world. The harbour is naturally divided into several parts. At the entrance from the Atlantic is the outer harbour (about 122 sq.mi.), known as Lower bay. Raritan bay lies adjacent to the Lower bay on the west and the Raritan river and the Kill van Kull flow into the west side of Raritan bay. The Ambrose channel is the

chief of several channels crossing the broad bar at the entrance to the outer harbour. It leads northwestward and then northward into the inner harbour, through the Narrows, a neck about one mile wide between Long Island and Staten Island. The inner harbour consists of the Upper bay, four miles long and four miles wide, the lower Hudson river, the East river, Long Island sound and tributary waterways. The tributary waterways to the east are Gowanus creek, Newtown creek, the Harlem river, the Bronx river, Westchester creek, Flushing bay and creek and Eastchester creek. Tributaries to the west are Kill van Kull, Arthur Kill, Newark bay, the Passaic river and the Hackensack river. Anchorage channel, an extension of Ambrose channel, extending through the Upper bay to the mouth of the Hudson river at the Battery, affords a depth of 40 ft. at mean low water for a width of 2,000 ft. Within the port are 42 channels, from 38 to 45 ft. deep. The port of New York has a total length measured around piers and shore lines of about 755 mi., 460 mi. in New York and 295 mi. in New Jersey. The developed frontage measured along bulkheads is approximately 520 mi., of which 320 mi. are in New York. The mean tidal range is 4.6 ft. in the Lower bay and 4.5 ft. in the Upper bay. The harbour also has two northern entrances: the northeast entrance from Long Island sound by the East river, principally used by New England coasting vessels; and the North (lower Hudson) river, by which the inland waterborne traffic of the Hudson river and Erie canal is brought to the port of New York.

About 80,000,000 tons of rail-borne commerce passed through the port in 1949. Of this about 1,000,000 were transshipped from vessels. A total of 7,789 vessels of 34,019,513 net registered tons entered and 7,758 vessels of 34,095,879 net registered tons cleared the port in foreign trade.

In 1921 the states of New Jersey and New York entered their port treaty that established the principles under which the Port of New York authority was established; its purpose was to coordinate the terminal, transport and other facilities of commerce in and about the port of New York. This agency and the department of marine and aviation operate most of New York city's port facilities; most of the docks are controlled by the latter, most terminal, transport and other facilities are controlled by the former. The area of the port of New York district within the jurisdiction of the Port authority is about 1,500 sq.mi., extending from below Sandy Hook on the south to Tarrytown on the north.

Serving this area is the first of the projected belt lines, a consolidation of short transfer lines, extending along the west bank of the Hudson and connecting all the trunk lines entering the Jersey side of the port. The Holland vehicular tunnel, opened in 1927, was brought under the Port authority's control in 1930. The Lincoln vehicular (mid-town) tunnel opened in 1938.

Two bridges across the Arthur Kill, one from Perth Amboy, N.J., to Tottenville, S.I., and the other from Elizabeth, N.J., to Howland Hook, S.I., were opened to traffic on June 29, 1928. A third, the magnificent George Washington bridge across the Hudson at 178th street, was opened on Oct. 25, 1931, and a fourth, the Kill van Kull arch between Staten Island and Bayonne, N.J., was opened on Nov. 25 of the same year. The suspension span of the George Washington bridge, measuring about 3,500 ft., is more than twice as long as any such span previously constructed. The Port authority completed in 1933 the 16-story inland freight terminal occupying the entire block between 8th and 9th avenues and 15th and 16th streets.

In 1949 a union motor truck terminal was opened; this four-block-long terminal, built near the Holland tunnel, provided a consolidation and interchange point for over-the-road trucks. In 1950 a $24,000,000 union bus terminal designed to provide facilities for all commuted and long-distance bus traffic entering into New York city was completed. This block-long terminal extends from Eighth to Ninth avenues and from 40th to 41st streets; it is connected directly with the Lincoln tunnel by ramps.

Banking, Exchange and Insurance.—Since the beginning of the city's history, the financial district of New York has been at the end of Manhattan Island, below Fulton street. Here are the largest banks and trust companies, the exchanges and many insurance headquarters. In 1784 Alexander Hamilton wrote the constitution for the Bank of New York, the first bank to be established in the city, in operation five years before the U.S. constitution was adopted. This bank was originally at 67 St. George's square, now Pearl street, and was later moved to 48 Wall street. The first bank of the United States was established in 1791, and a branch known as the office of discount and deposit was opened in New York in the same year. The Bank of the Manhattan company was the third bank to be organized in the city and its charter is notable as being the first to enable a public utility company to engage in banking. The Manhattan company furnished New York with water for 43 years. The Bank of the Manhattan company is still at its original location at 40 Wall street. It continues to operate under its original charter, through the expedient of maintaining a water tower. The Merchants and Mechanics and Metals National banks, the Bank of America, the Phenix and City (now the National City bank), all date from the early 19th century. When the Chemical National bank was organized in 1823 there were already 12 others, having an aggregate capital of more than $15,000,000.

The subtreasury of the United States, formerly on Wall street, was abolished in 1914. On Feb. 21, 1940, it became a national monument—Federal Hall memorial. A part of the functions of the subtreasury are carried on by the U.S. assay office at 32 Wall street. The New York clearinghouse, located on Cedar street, was established in 1853. Bank clearings for the fiscal year ending Sept. 30, 1950, totalled $383,731,184,075. New York is the centre of the federal reserve district no. 2 (*see* Federal Reserve System, The). The number of savings banks in greater New York in 1950 was 54; deposits held were $8,920,198,421. The New York Stock exchange (*see* Stock Exchange) occupies a building designed by James Rennick and had, in 1951, 1,375 members.

The New York Curb market was formerly an open-air market for unlisted securities. It is housed in its own buildings at 78 Trinity place, completed in 1921.

Wholesale Trade.—New York city, the largest wholesale trade centre in the country, in 1949 employed 360,000 people in the more than 35,000 wholesale establishments; more than 80% of this business is concentrated in the borough of Manhattan.

The clothing industry is chiefly centred in Manhattan, between Washington square and 42nd street, and in cross streets between 7th avenue and Broadway. Silk establishments have two principal centres, one bounded roughly by 23rd and 34th streets and Third and Fifth avenues; the other, on or adjacent to Broadway between Canal and Eighth streets. Fur establishments are sharply localized between Broadway and Eighth avenue and 26th and 30th streets. The millinery business, formerly chiefly along Broadway, between Canal and 14th streets, moved to a centre between Broadway and Fifth avenue above 34th street. Boot and shoe establishments are almost exclusively in lower Manhattan between Broadway and West Broadway below Canal street. Jewellery, formerly concentrated in and about Maiden lane, later became distributed in smaller groups between Maiden lane and 50th street along Broadway and Fifth avenue, with large and growing centres at and about the intersection of Canal street and the Bowery and on 47th street between Fifth and Sixth avenues. Fruit and produce markets are centralized in Manhattan between Canal and Cortlandt streets, and West Broadway and the North river. The fish, butter, egg and cheese markets are highly concentrated on the lower west side between Harrison and Greenwich streets and meat establishments centre at West 14th street and the North river. The coffee, tea and spice markets are mainly in a small area on the lower east side about Water and Front streets. Hardware houses are around Warren and Chambers streets, west of Broadway; paper and stationery are much more widely scattered than formerly, largely because of the uptown movement of printing and publishing establishments, one great centre being at or near Park row and the other in the neighbourhood of the new post office about 34th street. Drug establishments are chiefly in lower Manhattan, while leather dealers are just below Brooklyn bridge. Total value of wholesale trade for the city for 1948 was about $38,488,056,000.

Retail Trade followed the northward movement of population.

In 1850 it was at Canal street and by 1880 at 14th street. At mid-20th century it was between 31st and 59th streets, and Third and Eighth avenues. Fifth avenue was formerly exclusively residential but later was given up to retail trade as far north as 59th street. Beyond that a zoning ordinance reserved it for residence. Some of the largest department stores are still on 34th street, and the greatest volume of trade is done there. But the northward trend of the residential section affected the character of the trade, and the more expensive shops, including some of the oldest retail firms, are farther up Fifth avenue, continually pressing on toward the most exclusive residential quarters of the city which are now on Park and Fifth avenues, above 60th street. The dressmakers, milliners and tailors for this district are on the side streets leading off Fifth avenue. Madison avenue, because of its situation between Park and Fifth avenues, rapidly took on the aspect of the latter, and is lined with shops from 42nd street to the Eighties. The art and antique dealers are on 57th and adjacent streets, and on Madison and Lexington avenues. There are a number of small antique shops on Eighth street. Automobile houses are near Columbus circle and up Broadway from 55th street for more than ten blocks. Brooklyn and the Bronx have important shopping and financial districts of their own. The growth and decentralization of population precipitated a trend among large department stores toward building branches of their stores in suburban areas of the city and in many cases in the neighbouring counties. The decline in the number of retail establishments from 135,100 to 103,933 in the 1939–48 period was caused by greater concentration of ownership. The total value of retail trade for the city in 1948 was $8,019,696,000.

Building Construction.—In 1949 the total number of buildings constructed in the five boroughs was 10,300, at an estimated cost of $261,794,990. Modern building construction in New York dates from the erection of the ten-story Tower building in 1889. The loftiest edifice in the world at mid-20th century, the Empire State building on Fifth avenue at 34th street, rises to a gross height of 1,250 ft. from the street level and has 102 stories. A 50-mi. panorama is visible from its tower. Rockefeller centre, largest privately owned business and amusement centre in America, begun in 1931 and completed in 1947 with the addition of a new building to the group completed before World War II, covers almost 13 ac. between Fifth and Sixth avenues from 48th to mid-51st streets. There are 15 separate buildings and the 5 edifices of the western section of the centre comprise Radio City. The estimated daily population of the centre was 160,000 in 1950.

In 1938, under a new charter, a department of housing and buildings, directed by a commissioner, took control over enforcing the multiple dwelling law, the labour law and the building code. Laws affecting building in the city date back to 1647. Early laws dealt primarily with fire prevention. In 1867 a law dealing with fire and ventilation was passed; in 1899 a new building code was adopted; in 1901 a tenement house law was enacted. After 1935, through the activity of the New York City Housing authority, the federal government, private enterprise and the department of housing and buildings, great strides in modern housing were made.

At the end of World War II these groups greatly expanded the scope and tempo of construction activities so that by the end of 1950 about 59,000 apartments had been constructed for middle and low income families under federal, state and local auspices. These were mostly modern, fireproof multifamily dwellings designed to include ample recreational facilities. Added to these more than 50 permanent and 8 temporary housing projects constructed with public funds were such vast projects as Stuyvesant Town, Cooper Village and Fresh Meadows, constructed with funds supplied by large institutional investors.

Manufacturing.—New York city is the leading manufacturing city in the nation, a position it has held since 1824. In 1947 the city accounted for more than a third of the industrial production of the country's 11 largest industrial areas. The total value added by manufacture was $5,520,425,000. There were 741,247 manufacturing production workers in the city (about 100 in every 1,000 population) and 37,870 factories. The average annual wage of the city's industrial wage earner was $2,732.47. The ten leading manufacturing industries in terms of the number of workers they employed in 1949 (total 971,700), according to New York state department of labour estimates, were: apparel and other finished fabric products, 342,800; printing, publishing and allied industries, 118,700; food and kindred products, 79,900; fabricated metal products (including ordnance), 47,600; leather and leather products, 37,900; chemicals and allied products, 34,600; textile-mill products, 34,600; electrical machinery, equipment and supplies, 34,100; machinery (excluding electrical), 31,700. More than 78% of the total manufacturing employment was in these industries. In the period 1939–47 employment rose 45% and value added in manufacture rose 195%.

TRANSPORTATION AND COMMUNICATION

Rapid Transit.—The problem of transportation and communication in New York city is unique, not only because of the extraordinary concentration of people in certain areas at a given moment, but also because of the rapid growth and shifting areas of population that must be served. Getting people to and from work and goods and produce to market with speed and safety is one of the city's major problems.

On almost any weekday morning from 7 to 10 A.M., more than 1,600,000 people ride the subways to work. At the peak of the day's rush, between 5 and 6 P.M., more than 800,000 passengers enter the subways on their way home from work. The vast 242-route-mile city-owned rapid transit system had its beginnings with the primitive steam locomotives that pulled cars along the Ninth avenue elevated railway, extending from Battery place near the southerly end of Manhattan to 30th street. This construction, slightly more than three miles in length, was opened for traffic in 1870. The next decade witnessed its growth to 32.5 route miles of track, forming four separate transit lines extending north and south on Manhattan; three reached the Harlem river and one ended at 59th street. These lines were entirely private enterprises, built and operated over the public streets under perpetual franchises granted by the state legislature. For the next 20 years there were no extensions to the rapid transit lines on Manhattan, but some progress was made in other boroughs—the Third avenue "L" in Manhattan was extended across the Harlem river as far as 169th street by 1888, to 177th street by 1891, to Fordham road by 1901 and to its terminus at Bronx park by 1902. In the borough of Brooklyn the first elevated, the Lexington avenue line, having a route length of about six miles, was opened in 1885. This line was extended and other lines built until by 1900 the Brooklyn system had a route length of 62 mi. In 1902 the motive power of these elevated lines was changed from steam to electricity. In 1900 the first subway was planned and finally extended from the Bronx through Manhattan and under the East river to Brooklyn. This rapid transit system was a municipal undertaking, its construction cost being entirely defrayed by the sale of bonds issued by the city of New York. Between 1908–10 two tubes under the Hudson river connecting Manhattan with Hoboken (terminus of the Delaware, Lackawanna and Western) and Jersey City (terminus of the Erie, Pennsylvania and Central of New Jersey railways) and a connecting tube which extends up Sixth avenue from Cortlandt street to 33rd street were completed. In 1913 the city entered into contracts to create two interborough rapid transit systems, each comporting extensions to the existing lines; the one provided for a new Lexington avenue line and the extension of the west side subway down Seventh avenue to lower Manhattan and thence under the East river to Brooklyn. Another contract included a four-track subway on Broadway and Seventh avenue, Manhattan, extending through tunnels to Brooklyn and Queens. The operating contracts made with the two companies were to run for 49 years, dating from Jan. 1, 1919, and from Aug. 1, 1920, respectively. In 1925, the city began building an independent subway system, the main unit of which, the Eighth avenue line, commenced operation in 1932. With the beginning of the LaGuardia administration and the aid of WPA funds, work was pushed rapidly and many more miles of track were opened on the Independent subway, and the new Sixth avenue line was completed. The

Sixth avenue "L" was razed, and buses rapidly replaced surface cars. Unification of the transit system of the city was accomplished in June 1940. The city purchased the two privately owned transit companies for $326,248,187; through condemnation proceedings it acquired title to "L" lines in Brooklyn and Manhattan which with the exception of the Third avenue line in Manhattan were abandoned. Transit facilities, when acquired, were in serious need of modernization to meet the needs of a growing city. At the end of World War II a program costing more than $200,000,000 to modernize and extend subway services began. A board of three members, one of whom is chairman, appointed by the mayor at salaries of $20,000 a year, control the transit system. Thus the New York city transit system, including surface transit, became the largest municipally owned and operated transit property in the United States. The subway system is divided into three divisions, the Interborough Rapid Transit, the Brooklyn-Manhattan Transit and the Independent.

Railroads.—Trains carrying passengers and freight from all parts of the country enter into the terminals in or around New York city. The New York Central and Hudson River and West Shore railways follow closely the Erie canal route to Buffalo. The Erie, the Lehigh Valley, the Pennsylvania and the Delaware, Lackawanna and Western railways reach Buffalo by routes across New Jersey, Pennsylvania and western New York. The New York, New Haven and Hartford railway affords communication with New England; and the Pennsylvania and the Baltimore and Ohio railways with the middle western and southeastern parts of the country. The Central railroad of New Jersey and the Long Island railway (belonging to the Pennsylvania) are primarily local. The New York Central and the New York, New Haven and Hartford railways have a common terminal in Manhattan (Grand Central station), at 42nd street and Park avenue, and the Pennsylvania has its terminal at 32nd street and Seventh avenue, with tunnels to Long Island and New Jersey. The Pennsylvania terminal is used also as a terminal by the Long Island railway which has another terminal at Atlantic and Flatbush avenues in the borough of Brooklyn. The other railway terminals are on the New Jersey bank of the Hudson and are reached either by tunnel, ferry or subway.

Streets.—The first comprehensive street plan was made in 1811; with few changes, notably the laying out of Madison avenue, midway between Fourth and Fifth avenues, north of 23rd street, and Lexington avenue between Third and Fourth avenues, north from 21st street, it is the street plan of Manhattan today as far north as 155th street. The 120,000 population at that time was concentrated south of Houston street. The plan provided straight line "avenues," with a uniform width of 100 ft. extending longitudinally along the island and separating block lengths ranging from 610 to 920 ft. At right angles thereto, "streets," usually 60 ft. wide, were laid out, but 15 were made 100 ft. wide. These streets were separated by a block depth of 200 ft. The plan included the extension of Broadway, which has a general direction diagonally across Manhattan to 79th street, whence it parallels the other avenues. This system was later called upon to perform duties hardly foreseen at that time. The rapid growth of the city, the skyscraper and the use of motor vehicles produced serious traffic congestion in many sections of the city; and this necessitated extensive street widening and the development of new thoroughfares. In an attempt to unsnarl the vexing traffic problem, the city established a department of traffic with power to make traffic rules and regulations, design traffic signals and recommend to the mayor programs designed to effect the movement of pedestrian and vehicular traffic. Among its first major proposals were that an authority be created to establish off-street parking facilities, and that an improved traffic control system be installed to effect smoother, more rapid and safe vehicular and pedestrian traffic.

A new bus terminal designed to keep intercity transport off crowded streets; and early morning truck loadings in crowded industrial areas were among the other measures designed to loosen up traffic snarl.

Notable improvements were the two partially elevated highways for motor vehicles. One, on the west side, provided a 13-mi. nonstop drive from one end of the borough to the other; the other, along the East river, a nonstop drive from the Battery to 125th street and then into the Harlem River drive. These highway systems were to be linked at the southern end by the Battery park underpass. Other improvements were the three-mile viaduct on the Jersey side of the river, leading from the Holland tunnel to the main highway to Trenton; the extension of the Hutchinson River parkway, the Henry Hudson parkway and the beautiful Bronx River parkway, extending for 15 mi. through Westchester county; the bridges and highways in the Triborough bridge project, opened in July 1936; and the Belt parkway, primarily a three-lane superhighway, which from the Brooklyn-Manhattan tunnel rims the boroughs of Brooklyn and Queens for a distance of more than 40 mi.

The more notable streets include Wall street, on lower Manhattan, the heart of the financial district; Fifth avenue with its fine shops, residences, clubs, library and museum; Riverside drive, overlooking the Hudson; Park avenue, which continues Fourth avenue above 32nd street to the Grand Central terminal and thence from 45th street to the Harlem river, and is lined with fine apartment houses in the middle section above 45th street; the Bowery, which runs diagonally through the east side of lower Manhattan from the Brooklyn bridge to intersect Fourth avenue at Eighth street; and Broadway, which extends more than 18 mi. from the southern tip of Manhattan to the northern limits of the city. In its middle part, from 10th to 79th streets, it cuts through the heart of the business and amusement centre. This street owes its name to the Dutch, who called it the "breede weg." It is no longer a "broad way," but quite narrow, particularly in the lower downtown section. From 34th street to Columbus circle at 59th street it forms the centre of the automobile, theatre, moving picture, restaurant and night life district. Subways follow the course of Broadway for the greater part of its extent.

The programs of replacement and modernization of surface cars with bus lines was begun in the mid-1930s and continued after World War II. With only a few exceptions, surface cars had been displaced by bus lines in 1950. Only in Brooklyn, where new high-speed trolleys and trolley coaches were installed, do they play an important part in surface transportation. Manhattan abandoned all its trolley lines. The city acquired a large portion of surface transportation, about 575 route miles, in 1950. A rapid expansion of population into suburban areas necessitated the expansion of surface transport in these areas.

Bridges and Tunnels.—There were in 1951 seven bridges spanning the East river. One completed in that year links the east Harlem area with a large playground and park on Ward's Island. The George Washington bridge, crossing the Hudson river, extends from a point near 178th street, Manhattan, to Fort Lee, N.J. The span is 3,500 ft., tower height 600 ft. The Brooklyn, Manhattan and Williamsburg bridges have their Manhattan terminals at Park row, Canal, Clinton and Delancey streets, respectively. All are suspension bridges and connect Manhattan Island with Brooklyn. The Brooklyn bridge, the first to span the East river, was opened to traffic on May 24, 1883. The Manhattan bridge was opened to traffic on Dec. 31, 1909, the Williamsburg bridge on Dec. 19, 1903, and the Queensboro bridge on March 30, 1909. All of these are municipally owned and operated for highway, trolley or bus, elevated railway and pedestrian traffic. The Hell Gate bridge over the East river is owned by the New York Connecting Railroad company and is exclusively for railway traffic. The Triborough bridge over the East river, which opened in 1936, actually consists of four bridges over water and 12 on land, its arms extending into Manhattan, the Bronx and Queens. The vertical lift bridge between Randall's Island and Manhattan is one of the largest of that type in the country. The Bronx-Whitestone bridge, opened in 1939, connects the Bronx with Queens.

The Harlem river is crossed by 13 bridges of various types and designs. The most notable is the famous High bridge (1848) which carries an aqueduct of the city water supply. This was rebuilt in 1928 to improve navigation.

Transportation of passengers by rail between the boroughs of

Manhattan, Brooklyn, the Bronx and Queens and New Jersey is provided by means of tunnels constructed well below the beds of the East, Hudson and Harlem rivers. Vehicular transportation between Manhattan and Jersey City was made possible by the opening to traffic of the Holland vehicular tunnel in Nov. 1927, a twin-tube highway, 9,250 ft. in length. In Dec. 1937 the Lincoln tunnel, connecting 39th street in Manhattan with Weehawken in New Jersey, was opened to traffic. A north-south avenue, midway between Ninth and Tenth avenues, permits entrance to this tunnel at 34th, 35th, 36th, 40th, 41st and 42nd streets (*see* HOLLAND AND LINCOLN VEHICULAR TUNNELS). The Queens Midtown tunnel, finished in 1940, connects Manhattan on the east side at 36th and 37th streets with Long Island City. It is a twin-tube highway, 7,500 ft. long. The Brooklyn-Battery tunnel was opened to traffic on May 25, 1950. This twin-tube 11,000-ft. structure was the longest underriver ventilated vehicular tunnel in the country at the time of its completion. This tunnel connects the southern tip of Manhattan with Gowanus parkway, which branches into the Belt system or into downtown Brooklyn. The Pennsylvania railroad has four tubes across the East river and two across the Hudson. The Hudson and Manhattan Railroad company has two systems, each comprising two single-track tubes from Jersey City, one to the downtown section of Manhattan looping around Fulton and Cortlandt streets at Church street, the other entering at Morton street and extending to 33rd street. The Brooklyn-Manhattan Transit system has six rapid transit tubes under the East river, laid in pairs leaving Manhattan at Whitehall, E. 14th and E. 60th streets. The Interborough Rapid Transit system also has three pairs of transit tubes leaving Manhattan at Whitehall street, Old Slip and E. 42nd street. Practically all of the railroad and rapid transit tunnels were completed between 1900 and 1920. In connection with the Independent subway system, the board of transportation designed five new tunnels, four of which were opened for service in 1933 and one in 1936. Of the three under the East river, one extends from 53rd street, Manhattan, to Mott avenue, Queens, connecting the Sixth and Eighth avenue trunk lines and the lines from Jamaica and central Brooklyn at Queens Plaza station in Long Island City; the other runs from Fulton street, Manhattan, to Cranberry street, Brooklyn. The third tunnel runs from Rutgers street in Manhattan to Jay street in Brooklyn. Under the Harlem river a three-track tunnel connects the Washington Heights line with the subway under the Grand Concourse in the Bronx. This extends from the Polo Grounds at 156th street and Eighth avenue, Manhattan, to 161st street and Jerome avenue, the Bronx. The fifth tunnel under Newtown creek extends from Manhattan avenue in Brooklyn to Jackson avenue, Queens.

Ferries.—The city department of marine and aviation, two federal agencies, the railroads with terminals in New Jersey and a number of private companies operate ferries in and about New York harbour. The city in 1950 operated one major ferry line, shuttling seven boats between Manhattan and Richmond, and three small ferries serving islands in the East river and Long Island sound where city institutions are maintained. The Staten Island ferry ride is one of the city's recreational features, offering a ten-mile, one-hour round trip through the busy New York harbour, and affording a magnificent view of the New York sky line, the Statue of Liberty and Governor's Island.

Airports.—In 1947 four airports in the metropolitan area were combined into a single integrated air terminal system under the control of the Port of New York authority. Studies made after World War II indicated that postwar growth of air transport could not be met with the existing terminal facilities operating in an unorganized fashion. Included in this system was LaGuardia field, Queens, covering more than 550 ac.; opened in 1939, this field is one of the busiest airports in the world. It handled an average of 437 incoming and outgoing flights a day in 1949. Built at a cost of about $28,000,000, it was improved by the addition of an excellent air-ground communication system. Although it had handled most overseas and long-distance domestic traffic it was being prepared at mid-century to handle short-haul domestic travel within about a 500-mi. radius of New York city. New York International airport, the world's largest at mid-century, covered about 4,900 ac. and had seven 200-ft.-wide runways up to 9,500 ft. in length. Still in the process of being constructed in 1951, it was to have the largest and most complete airport facilities, designed to serve overseas air traffic. In 1949, 14 air lines operated from this field.

Newark airport on the New Jersey side of the river, expanded to 2,200 ac. with reconstructed terminal facilities, was also being prepared in 1951 to handle long-haul domestic air travel. Teterboro airport in Bergen county, N.J., handled charter service, executive and private planes and other nonscheduled flights, but was to be developed to handle regular commercial flights when the need arose.

Telephone and Telegraph.—In 1950 there were in greater New York city 3,059,579 telephones as compared with 1,713,521 in 1940. Telegraph and cable service is supplied mainly by Western Union which in 1951 maintained 192 branch offices; in addition about 2,600 business concerns had installations which enabled them to send wires directly from their establishments by facsimile or printing telegraph. Fifteen cables touched New York, five owned by Western Union, five by Commercial, four by All America and one by a French company.

Postal Service.—The post office of New York city in 1827 was located in a small two-story frame building on Garden street (now Exchange place), and the entire force consisted of about eight clerks and six letter carriers. Fifty years later the city hall station at Park row and Broadway was the general post office. In 1914, the present general post office building was opened on Eighth avenue from 31st to 33rd streets, containing 500,000 sq.ft. of floor space. There were in addition 100 classified stations and 8 contract stations in the city in 1950 and a total of 33,101 employees. The transportation of mails is expedited by means of an underground pneumatic tube system consisting of 27 mi. of double-line eight-inch tubes, with a carrying capacity of approximately 200,000 pieces of mail per hour. In the year 1827 the postal receipts amounted to about $125,000; in the year ending June 30, 1950, they were $166,175,527. On an average the post office received, delivered and dispatched daily 31,658,000 pieces of ordinary mail; weighed and dispatched 370,000 lb. of newspapers and periodicals and 200,000 insured and C.O.D. parcel post packages.

GOVERNMENT

The city's form of government was inaugurated by the greater New York charter of 1897. It provided for a mayor elected at large, five borough presidents, chosen by the voters of their respective boroughs, a board of aldermen of 65 elective members, one from each aldermanic district, with a president of the board of aldermen, elected at large. A controller, elected at large, was head of the department of finance. The mayor, controller, president of the board of aldermen and the five borough presidents were designated as members of the board of estimate and apportionment.

A new city charter, adopted by popular referendum on Nov. 3, 1936, became effective on Jan. 1, 1938. To replace the board of aldermen it provided for a city council, elected by a system of proportional representation, whose membership varied in rough proportion to the voting population of the boroughs; that is, one councilman for every 75,000 votes cast therein, with an additional member for any fraction of that number above 50,000. The proportional representative system of electing councilmen was abolished by popular referendum in the 1947 election. Under a new law one councilman is elected for each of the state senate districts wholly within the city for a term of four years, by a simple majority vote. Beginning in 1949, 25 councilmen were elected, 9 from Brooklyn, 6 from Manhattan, 5 in the Bronx, 4 in Queens and 1 in Richmond. The board of estimate continued with little change beyond the substitution of the president of the council for the president of the board of aldermen. It constitutes the general administrative branch and has limited control over legislation. In the case of local laws directly affecting the organization and administration of the government and amendments to the

charter its approval is required. The board of estimate has exclusive authority to grant franchises, but no franchise may be for a longer term than 25 years, except that a tunnel railroad franchise may be for a period not exceeding 50 years. With respect to all local laws, however, the mayor retains his veto, which can be overridden only by a two-thirds majority of the council. A city treasurer appointed by the mayor heads the department of finance.

In addition to these major divisions, there is a department of public works responsible for the municipal plant and structures; a department of housing; a city planning commission; a department of investigation; and various other departments and bureaus, including departments of education, marine and aviation, correction, health, hospitals, law, parks, police, public welfare, purchase, sanitation, a fire department and a civil service commission. Among its functions, the planning commission has control of zoning and the drawing up of the capital budget.

The mayor, as chief executive, appoints the heads of all departments except those under the exclusive direction of the borough presidents. All purely local improvements, such as streets and sewers, continue in the hands of local improvement boards and the borough presidents, while improvements affecting broader areas such as intercepting sewers and sewage disposal plants are under the control of the central department of public works.

An amendment to the state constitution, approved by the voters in Dec. 1935, provided for a reform of the county government within the city of New York. There are five county governments within greater New York, namely, New York, Bronx, Kings, Queens and Richmond. The officers of the five different counties function almost independently of the city officers and often in duplication of the activities of the latter. Under the amendment the city has the theoretical power through the enactment of local laws to abolish any county office within its limits except that of judge, county clerk or district attorney; or it may reassign the functions of county officers, with certain exceptions, to city or other county officials or to the courts. The county clerks are appointed and removable by the appellate division of the supreme court in the judicial department in which their respective counties are located.

Civil service regulations apply to all officers and all employees of the city except those who are elected by the people, legislative officers and staffs of those educational institutions which have special professional standards. The civil service commission of the city consists of three members appointed by the mayor, not more than two of whom may be of the same political party. Salary of the president at mid-century was $10,000 a year; of the commissioners, $9,000.

In 1920 the New York city employees' retirement system was put into effect. All persons in city service, whether appointive or elective, who entered or re-entered the city service after Oct. 1, 1920, and who had completed six months of city service became eligible to the benefits of this retirement system, except those entitled to share in the police pension fund, the fire department relief fund, the teachers' retirement system or the department of street cleaning relief and pension fund.

FINANCE AND TAXATION

The city's budget is far from being a comprehensive financial plan. The executive or expense budget prepared by the mayor for the fiscal year beginning July 1, 1950, totalled more than $1,232,000,000. This amount represented anticipated expenditures by the agencies of city and county government plus state and federal aid to welfare and education. An estimate of the amounts of revenue by source was also included in this document. Debt service, including the debt cost of the city-operated transit system, accounted for about 20% of the total expenditures. The largest single item in the budget, education, accounted for slightly less than 20%, while welfare needs took more than 15% of the total. In June 1940 the city government acquired and unified its rapid transit system, which thereafter operated practically on an independent budgetary basis. The budget of the system is prepared by the board of transportation. The transit system's total debt service, including unification bonds, ran close to $57,000,000 for the first year; this had increased to $68,649,000 in 1950, primarily because of postwar rehabilitation and expansion of services.

Other city utilities are included in the current budget, their earnings being merged in the general fund revenues. Expenditures for capital improvements are considered separately. The so-called capital budget, prepared by the city planning commission, applies to the calendar rather than the city's fiscal year. It does not include capital expenditures to be paid for by special assessments. For the year 1951 the capital budget was about $467,000,000. The total cost of the city operations, including an estimate of debt costs of capital budget expenditures applicable to the same period, is included in the expenditure budget. The cost of government almost doubled in the decade 1940–50. The city's financial difficulties appeared to grow more perplexing with each passing year.

The assessed valuation of taxable real estate in the city (including special franchises and the real estate of corporations) for 1950–51 aggregated $18,396,000,000. A peak of $19,600,000,000 was reached in 1932. The basic tax rate of the city for the fiscal year 1950–51 was $3.08 for each $100 of assessed valuation.

The city charter, which became effective Jan. 1, 1938, made numerous changes in the fiscal organization and procedure of the city government. It changed the beginning of the fiscal year from Jan. 1 to July 1, and bridged the gap by a six-months' budget. The current or "expense" budget operates on the basis of the fiscal year, while the capital budget follows the calendar year. A bureau of the budget, under a director appointed by the mayor, is established to assist the mayor in preparing the current budget. The budget goes to the board of estimate, then to the council, which must act upon it by May 21, otherwise it is deemed to be adopted as passed by the board of estimate. Finally, the mayor may veto any changes made by the council. The capital budget is prepared by the city planning commission and is completely separated from the current budget.

Under the new charter, the controller, who is elected at large, is the chief financial officer of the city government. It is his business to advise the board of estimate, to approve the disbursement of funds, to audit the accounts of the city departments and agencies and to manage the sale and retirement of the city's securities.

There is no independent audit of the decisions, books, records and reports of the controller. Aside from the office of controller and the bureau of the budget mentioned above, there is a department of finance, headed by the treasurer (formerly the city chamberlain), who is appointed by the mayor. This department includes the bureau of city collections and the bureau of receipts and disbursements.

Four agencies handle the tax and licence work of the city: the tax department, the board of assessors, the board of revision of assessments and the department of licences. The financial organization of the city also includes a department of purchase, headed by a commissioner appointed by the mayor. The department has sole authority to purchase supplies and equipment for all departments and agencies of the city government except the institutions and offices of the board of higher education and the department of education.

Police.—The police force of the city of New York, including uniformed, nonuniformed, extra and special personnel, numbered about 20,000 in 1950. It is under the direction of a commissioner, appointed and removable by the mayor, at a salary of $15,000 a year. The headquarters of the police department are in Manhattan. There are 35 precinct station houses in Manhattan, 34 in Brooklyn, 16 in Queens, 13 in the Bronx and 4 in Richmond.

The administrative activities of the department are carried on through the commissioner and six deputy commissioners, while a uniformed force is under the supervision of a chief inspector.

A significant feature of the police department is its academy for training, through which all recruits must pass. Two thousand men drawn from the ranks of patrolmen form the detective division. The budget appropriation for 1950–51 was $106,490,907.48, the great bulk of which was allotted to personal service. The total number of arrests on criminal charges and summonses served in

1949 was 963,745.

Fire.—A fire commissioner with a salary of $15,000 a year, appointed and removable by the mayor, heads the fire department, which in 1950 had 11,000 employees, including full-time paid firemen, officers and civil employees. At the head of this force and in charge of fire fighting is the chief of the department. In 1940 the three-platoon system and the eight-hour day were put into effect.

There were, in 1949, 221 engine companies, 127 hook-and-ladder companies supplemented by 58 special units consisting of 9 fireboats and 1 auxiliary fireboat, 6 water towers, 5 rescue units, 3 ambulances and various other special fire-fighting and service units. The department budget figure for 1950–51 was $59,672,-276.86 In 1949 there were 44,407 fires in the city, resulting in losses amounting to $20,249,930. For the five boroughs this loss amounted to: Manhattan, $8,663,325; Brooklyn, $4,493,195; Queens, $1,676,145; Bronx, $4,469,965; Richmond, $239,615. Deaths from fire totalled 128.

Health.—The department of health is under the direction of a commissioner appointed by the mayor at an annual salary of $15,-000. He has two deputy commissioners. The 1950–51 budgetary appropriation for the department was $13,769,287. It had a personnel of about 5,500 employees at that time. Within the department is the board of health, consisting of the commissioner, who is chairman, and four other members, appointed for a term of eight years, to serve without salary. The main office is in Manhattan, but the department operates offices, health centres and health stations in each borough.

Beginning in 1933, with the Central Harlem Health centre, which was housed in rented quarters, the department divided the city into 30 health districts, each with a population of about 250,000 and representing 20 administrative units; 12 districts function as individual units and 8 other units represent the 18 remaining districts. In 1950 there were 19 district health officers directing the 20 administrative units. Fifteen modern health centre buildings, one remodelled building and four in rented quarters were in operation in that year.

The major bureaus in the department are: administration, public health education, tuberculosis, nursing (1,200 nurses), child health, social hygiene, preventable diseases, laboratories, records, sanitation and food and drugs.

The board of health is responsible for matters of public health policy and for drafting the city's sanitary code. The department exercises sanitary supervision over about $3,000,000,000 worth of food supplies each year and regulates the sanitary conditions in about 100,000 establishments manufacturing, handling or storing food or patent medicine products; including bakeries, milk stores, restaurants and food stores.

In 1950 the city equalled its lowest recorded death rate of 1938, 10.0 per 1,000 population; in 1940 there had been a slight rise, to 10.2 per 1,000. Diphtheria deaths decreased from 86 in 1933 to 2 in 1950; diphtheria cases from 1,891 in 1933 to 58 in 1950. Tuberculosis mortality decreased from 64 per 100,000 in 1933 to 29.2 per 100,000 in 1950. Pneumonia mortality declined from 108 per 100,000 in 1933 to 32.3 per 100,000 in 1950. Typhoid fever had practically disappeared, with no deaths recorded from that cause in 1950. New low mortality rates were recorded for whooping cough, measles and other diseases. The birth rate in 1950 was 19.5 per 1,000. The lowest recorded was that for 1936, 13.6.

The U.S. public health service maintains general offices in the city under a medical director and consulting health specialists. It manages the U.S. quarantine station at Rosebank, Staten Island, and provides for inspection of ships' cargoes and all persons on board ships for quarantinable diseases, and for the medical inspection of immigrants at Ellis Island, where a U.S. marine hospital is maintained. Other U.S. marine hospitals are at Stapleton, Staten Island and 67 Hudson street, New York city.

The federal food and drug administration maintains its eastern district office and respective services and laboratories in the city.

About 40 voluntary health agencies operate in the city and co-operate with the health department. Among the more important of these are: New York chapter of the American Red Cross, American Social Hygiene association, New York Cancer committee, Brooklyn Tuberculosis and Health association, Committee on Neighborhood Health Development, Community Service Society of New York, Committees on Health of New York Academy of Medicine, New York Tuberculosis and Health association, New York Heart association, New York Diabetes association, State Charities Aid association.

Hospitals.—The department of hospitals was established in 1930 by the consolidation of the general and special hospitals of the departments of health and welfare, and Bellevue and allied hospitals. The head of the department is the commissioner, appointed by the mayor at an annual salary of $10,000; there are also two deputy commissioners at salaries of $9,000 each. Thirty-two municipal hospitals are maintained and operated by the department, which is the second largest of the city departments in number of employees (department of education is the highest). The department's appropriation for 1950–51 was $80,198,831.50.

The total number of city and voluntary hospitals in 1950 was about 1,251 including approximately 100 general hospitals, ranging in size from 3,000 beds to 50 beds or less. These 1,251 hospitals provided about 140,000 hospital beds and cared for nearly 800,000 patients annually. The municipal hospitals provided, in 1950, 20,000 beds and cared for about 280,000 persons. The voluntary hospitals of the city supplied approximately one-fourth of the city's care of medical indigents. Persons approved by the city were cared for in these hospitals at city expense at varying per diem rates fixed in the city budget. Eighty of the larger voluntary hospitals, not including convalescent homes, were members of the United Hospital fund, an association for co-operative hospital financing and financial reporting.

Among the chief private general hospitals are Mount Sinai, St. Luke's, Presbyterian, New York, Roosevelt, Lenox Hill and the Post Graduate. All of these hospitals are in the borough of Manhattan. In Brooklyn are the Long Island College hospital, Jewish, Brooklyn and Methodist Episcopal. Of the private special hospitals for women and children, the Lying-in, Sloane Maternity, Nursery and Child's, Woman's and Misericordia are the largest. Other special hospitals of note are the Joint Diseases, Special Surgery, New York Eye and Ear infirmary, Manhattan Eye, Ear and Throat hospital, Skin and Cancer hospital and Neurological institute.

The larger municipal hospitals, each providing 1,000 beds or more, are Bellevue, Kings County, City, Metropolitan, Seaview and Triboro. Among the events of interest in connection with the private hospital services of the city was the establishment of the Columbia-Presbyterian Medical centre and the New York Hospital Medical centre. In upper Manhattan are clustered the buildings of five separate units: the Presbyterian hospital (including the Presbyterian hospital, the Sloane hospital for women, the Vanderbilt clinic, the Squier urological clinic, the Stephen V. Harkness private patient pavilion and the Presbyterian hospital school of nursing); the Columbia university group (including the college of physicians and surgeons, the school of dental and oral surgery, the school of oral hygiene and the DeLamar Institute of Public Health); the Babies' Hospital of the City of New York; the Neurological Institute of New York; and the New York State Psychiatric institute and hospital. The New York Hospital Medical centre includes the Lying-in hospital, the Manhattan maternity and dispensary, the Nursery and Child's hospital, Payne Whitney psychiatric clinic, and is associated with Bloomingdale hospital for mental diseases and the convalescent hospital for children at White Plains, N.Y. All above services are affiliated with the Cornell university medical school.

Public Assistance.—Assistance and care for the needy are provided mainly by the city's department of welfare. The principal forms of public aid administered by the department are: home relief, cash grants, medical aid, etc., to individuals or families unable to support themselves; aid to dependent children and child care, for at home or outside their own homes; assistance-aid to veterans and dependents or survivors unable to assist themselves; old-age assistance, cash, medical and other aid to needy persons

THE STATUE OF LIBERTY, BEDLOE'S ISLAND, NEW YORK HARBOUR

This statue was presented to the United States by France; the sculptor was Frederic Auguste Bartholdi. Every traveller entering or leaving New York harbour views this statue as a landmark and a symbol of the country. A new floodlight system was inaugurated in Oct. 1931. The inscription on the pedestal (1903) is from "The New Colossus" by Emma Lazarus and reads (in part):

Give me your tired, your poor,
Your huddled masses yearning to breathe free,
The wretched refuse of your teeming shore,
Send these, the homeless, tempest-tossed, to me:
I lift my lamp beside the golden door.

65 years of age and over; and assistance to the blind, cash, medical aid and institutional care.

Shelters, homes and a camp are maintained to aid the sick and indigent. Day care centres for children of working mothers and day care centres for aged persons are among the other services provided. In 1949–50 the average monthly public assistance case load of this department was 165,809.

The department of welfare is under a commissioner appointed by the mayor at a salary of $15,000. He has two deputies who receive $9,000 and $8,500 respectively. In 1941 the work of various independent city agencies like the board of child welfare which was interested in child care were made a part of the larger central welfare agency. Reorganization of the department in 1948 divided the work functionally among six bureaus.

In 1949–50 about $181,000,000 was spent by the department, of which the city contributed 23%, the state 55% and the federal government 22%.

The private relief agencies of the city offer a great variety of services for family welfare and institutional care. The more important ones are affiliated in the Welfare Council of New York City, which seeks to co-ordinate the efforts of the individual agencies and carry on special research and informational services in the interest of all agencies and the general public. Mention should be made also of the Jewish Board of Guardians, the many Catholic charities and of the Community Service Society of New York. The Association for Improving the Condition of the Poor (1848) and the Charity Organization society (1883) merged in April 1939 to form the Community Service society.

Correction.—The department of correction is under the direction of a commissioner appointed by the mayor at a salary of $15,000 and there are two deputy commissioners, with salaries of $7,500 and $8,000.

The department administers the city institutions for the care and custody of criminals and misdemeanants and for the detention of witnesses in criminal actions. Under it are five city prison units and two local detention pens; also, the house of detention for women, the New York city reformatory and the two city penitentiaries and workhouses and prison wards in Bellevue and King's County hospitals. The budget appropriation, 1950–51, was $6,995,864. The total number of admissions to these prisons and institutions was more than 170,000 annually.

Apart from the department of correction, the city magistrate's courts, the courts of domestic relations, the courts of special sessions and the county courts provide an extensive system of probational investigation and supervision. There is also a city parole commission comprising the commissioner of correction, the police commissioner (ex officio) and three members appointed by the mayor for ten years each. The mayor designates the chairman from the three appointees and the chairman receives $10,000 a year and the other two members $7,500 each. The budget of the parole commission, 1950–51, was $162,329. The commission employs a chief parole officer and other parole officers. The jurisdiction of the commission extends to prisoners given indeterminate sentences by the city courts, and the officer assigned to each offender retains supervision for three years.

A large number of private agencies, including the Protestant Big Brother movement, the Catholic Big Brother and Big Sister organizations, the Volunteers of America, Salvation Army and the Jewish Board of Guardians, also deal with correctional problems.

Public Water Supply.—In the early days, the water supply of New York was derived from wells and from streams and ponds. In 1799 the Manhattan company was incorporated ostensibly to supply the city with water but, under a clause in its charter, devoted itself primarily to the banking business. In 1834 the legislature authorized the city to begin the necessary works to bring water from the Croton watershed more than 30 mi. N., and the first Croton water was delivered to the city in 1842 through the Croton aqueduct. In 1883 the new Croton aqueduct was authorized, and thus additional water became available in 1890. In 1905 the board of water supply was created and work was begun immediately on a new system to bring water from the Catskill mountains, more than 100 mi. N. This commission developed an additional water supply from the Esopus and Schoharie watersheds with a total dependable yield of about 600,000,000 gal. daily flowing through the Catskill aqueduct.

The Catskill aqueduct delivers its water just north of the city line into Hill View reservoir, which has a storage capacity of 900,000,000 gal. From the Hill View reservoir, Catskill water is delivered into the five boroughs of the city by gravity flow, through two tunnels in solid rock at depths varying from 300 ft. to 700 ft. below the street level; the tunnels are at maximum respectively 15 and 17 ft. in diameter. The total cost of the Catskill water-supply system was about $193,000,000. The average daily consumption of water in New York city for 1949 was 1,160,000,000 gal. Since the Catskill supply was so large, the city decreased its use of Croton water, but later facilities to use the entire Croton supply were provided. The public water-supply systems provide a dependable yield of about 1,050,000,000 gal. per day. In view of the narrow margin between this and the mounting consumption, a new construction program to draw water from the Delaware river was begun in 1936. The first stage of the Delaware supply system, comprising Rondout and Neversink reservoirs, with a short tunnel connecting them, and the Delaware aqueduct from Rondout reservoir to the city, was scheduled for completion in 1952—a deep-pressure tunnel in rock, 13½ ft. to 19½ ft. in diameter and 85 mi. long. Like the Catskill aqueduct, the Delaware aqueduct would lead into Hill View reservoir at the northern boundary of the city, 295 ft. above sea level. From here through city tunnels no. 1 and no. 2 the water would reach all five boroughs. The water supply is aerated and chemically treated, so the city's water is clear and wholesome. This first stage would add 205,000,000 gal. per day to the supply The proposed second stage, scheduled for completion in 1956, comprised the East Delaware reservoir and a 26-mi. tunnel to Rondout reservoir. Together they would add 540,000,000 gal. per day, and New York city would have a dependable supply of 1,500,000,000 gal., or 6,250,000 tons of water per day. A drainage area of 1,700 sq.mi., greater than the entire land area of Rhode Island, is required for the city's water-supply system.

Sanitation.—A department of sanitation was created in 1929, consolidating the five separate borough departments of street cleaning into one division of street cleaning. In 1933 the three-member sanitation commission was replaced by a single commissioner. The 1950–51 appropriation for the department was $55,160,250.08.

The area covered daily by the department consists of 5,940 mi. of streets and servicing of 705,804 buildings and homes, containing more than 2,440,000 apartments, for removal of garbage, ashes and refuse. This work is ordinarily accomplished with a personnel of about 12,600 men and 3,600 pieces of motorized equipment. About 62,000,000 cu.yd. of garbage, ashes and rubbish are collected daily. In outlying districts refuse is used for land fills; an outstanding example of such a reclaimed area was the site of the World's fair of 1939–40, which was turned into a park and recreational area. In emergencies such as heavy snowstorms this manpower may be augmented by 20,000 extra labourers and 3,000 additional pieces of automotive equipment. In the winter of 1947–48, when there was a total snowfall of 61.5 in., its removal cost more than $11,780,000.

Public Works.—The department of public works is directed by a commissioner appointed by the mayor at a salary of $15,000 a year. The department has charge and control of all planning, construction and repair work of all structures, buildings and other public works, paid for wholly or in part by city funds, and it must maintain and operate them. It also has charge of sewers and sewage-disposal plants. The budget appropriation for 1950–51 was $11,879,424.96.

The total plant controlled by the department reached a value at mid-20th century of almost $1,000,000,000. In 1949 the estimated cost of projects under construction totalled more than $50,000,000.

The city in 1950 was engaged in a vast sewage-disposal project whereby pollution of harbour waters was to be eliminated. An engineering bureau was established in 1930 to tackle this problem and in 1938, under the new charter, it came under the department

of public works. The early bureau commenced work on the Ward's Island plant, and completed the Coney Island plant, giving the city its first modern sewage-disposal plant in 1935. Within five years three additional plants had been completed and put into operation: Ward's Island plant, Tallmans Island plant and a part of the Bowery bay plant.

In 1948 this program to end pollution of harbour waters was given additional impetus when the Interstate Sanitation commission stipulated that all sewage pollution of waters within its jurisdiction should end by Dec. 1959 and that a minimum construction program should be carried out by the end of 1953. At the completion of this program the city was to have six new sewage-treatment plants in addition to the seven modern and six old plants in operation at that time. The completion of the long-range program was to see a total of 17 modern plants in operation.

City Planning and Zoning.—The greater New York charter adopted in 1898 provided that the responsibility for laying out street systems should be primarily vested in the borough presidents, with specific approval resting on the board of estimate and apportionment and independent approval by the mayor for changes in plan. In 1903 the board of aldermen created an improvement commission which reported in 1907. In 1913 a heights of buildings commission was created. This led to the building zone resolution of July 25, 1916, which regulated the height and bulk of buildings thereafter erected and the boundaries for trades and industries. This resolution divided the city into "use," "height" and "area" districts. The "use" districts are: (1) "residence," where no building can be erected other than for specified uses, such as dwellings, clubs, hotels, etc.; (2) "business," where specified trades considered as either offensive or dangerous are prohibited; and (3) "unrestricted," where no zoning regulations or restrictions are provided. The "height" districts provide for setbacks in buildings erected in excess of certain heights, the height and extent of the setbacks depending on the width of the adjoining streets. There were six "area" districts designated as A, B, C, D, E and F, and the size of court and rear yard required bore a definite ratio with the height of the building. The new city planning commission designated a seventh, "G"—a residential zone restricted to one-family dwellings. Changes in the zoning regulations of 1916, and amendments thereto were vested in a standing committee of the board of estimate and apportionment, called the city plan and public improvements committee. Rapid growth of population and business activity and general changes in the city's structure rendered the old zoning resolution and its patchwork of amendments inadequate. A new zoning resolution based on a two-year study of the city's requirements by the city planning commission was being considered by the board of estimates for adoption in 1951.

New York was the first city to adopt a zoning resolution Efforts in 1939 and 1940 to establish a planning commission and a master plan for the city failed. However, the new charter provided for a city planning commission to consist of a full-time chairman, at a salary of $15,000 a year, five additional members appointed by the mayor, and the chief engineer of the board of estimate. The chairman is head of the city planning department. The commission is charged with preparing a master plan of the city for its future development. It is responsible for completing and maintaining the city map; for zoning changes; the preparation of a capital budget and a five-year capital program; the approval of assessable improvements; the platting of land and the acquisition of land for streets and other public purposes. Appeals from the actions and decisions of the different superintendents of buildings and officers of the fire department who are charged with the enforcement of zoning regulations are made to the board of standards and appeals.

Public Markets.—The prime responsibility of the department of markets lies in the supervision of the city's food industry, which in 1949 handled more than 13,000,000,000 lb. of foodstuffs that came through the markets located in the city. The commissioner of public markets, who is appointed by the mayor at a salary of $15,000 a year, has supervision and control over all public markets, market places and lands, and all auctioneers of food and permits and leases for business. The department's prime functions are to assure the consumer adequate distribution of food, purity of content and protection from profiteering and theft by short weights or measures. The manufacture and sale of ice is also supervised.

The chief markets, wholesale and retail, are the Brooklyn and Bronx terminal markets, Essex street retail market, First avenue retail market, Fulton fish market, Gansevoort, Park avenue, Washington, West Washington, 13th avenue retail market, Wallabout and numerous smaller street markets. A picturesque feature of the city's congested foreign districts is the open-air pushcart market. To protect the retailer and real estate values the city regulated the itinerant pedlar.

Parks and Recreation.—A consolidated department of parks was established in 1934, directed by a commissioner appointed by the mayor at a salary of $25,000 a year. Its 4,500 full-time personnel are under civil service; the 1950–51 budget figure was $17,325,635.03.

In 1950 the city had about 525 modern playgrounds ranging from a quarter acre to developments like the Macombs Dam park in the Bronx, occupying 30 ac. In all, the park system included about 26,526 ac. of land. The recreational facilities range from archery to swimming pools, from football fields to yacht basins. Among major additions and improvements were Flushing Meadows (site of the World's fair of 1939–40), Red Hook recreation area, Brookville and Juniper Valley parks, Riverside park, Fort Tryon park, the Municipal stadium on Randall's Island, Jacob Riis park, zoos in Central and Prospect parks and the entire reconstruction of Bryant, Highland and St. James' parks. The modern parkways for motor traffic are planned with regard to proper connections with state and county systems.

The largest of the parks are the Pelham bay (Bronx), 2,130 ac.; Van Cortlandt (Bronx), 1,146 ac.; Marine (Brooklyn), 1,792 ac.; Great Kills (Richmond), 1,256 ac.; Flushing Meadows (Queens), 1,257 ac.; Central (Manhattan), 840 ac., and Bronx, 721 ac.

Central park extends from 59th to 110th streets, between Fifth and Eighth avenues. It was purchased in 1856 for about $5,500,000, and laid out and developed by the architects Frederick Law Olmsted and Calvert Vaux under the direction of a board of 11 commissioners, the first committee of construction including William Cullen Bryant, Washington Irving and George Bancroft. Van Cortlandt, Pelham bay and Forest parks are the largest generally devoted to outdoor sports and recreation. In Van Cortlandt park is the Van Cortlandt mansion, built in 1748, and now maintained as a museum. The Bronx park is noted for its zoological and botanical exhibits, the African veldt, opened in 1941, being one of its major attractions, and Prospect park for its beauty Riverside park, in Manhattan, extends along the east bank of the Hudson river from 72nd to 129th streets, a distance of about three miles. City Hall park constitutes a part of what was called the "common lands" in the middle of the 17th century. Roger Morris park is the site of the Jumel mansion, the home of Mme. Jumel, wife of Aaron Burr, and here Gen. George Washington made his headquarters during the battle of Harlem heights. In Audubon park was the home of the naturalist John James Audubon. Poe park, in the Bronx, is the site of the Edgar Allan Poe cottage. In Fort Greene park, Brooklyn, is a vault containing the remains of a few of those who died in the British prison ships in 1776 and after.

Courts.—The judicial system of the city is composed of the following courts: magistrates', including felony, homicide, municipal term, night, probation, traffic, week-end, women's, arrest, summons and adolescent courts; municipal (civil actions involving not more than $1,000); city (civil actions involving $1,000 to $3,000); county (in New York county, the court of general sessions; major crimes); special sessions (chiefly misdemeanours); domestic relations, including family and children's courts (children under 16, except murder in the first degree); and surrogate's (estates of infants and deceased persons). The mayor appoints about 80 city marshals whose chief duties are to serve summonses and execute dispossess warrants.

EDUCATION

Public-School System.—The free public-school system is administered as the department of education by an unpaid board of

nine, appointed by the mayor, for terms of seven years. The school system in 1950 comprised 890 public day schools with an enrolment of 943,000. There were 135 high schools, 63 of which were vocational. For each district there is a local board of five appointed by the borough president for five years. Members receive no compensation and may be removed by the mayor after a hearing.

The chief executive officer of the board of education is the superintendent of schools who is elected by the board of education and sits with this body though without vote. He receives a salary of $25,000 a year and holds office for six years. There are eight associate superintendents of schools. The superintendent and associate superintendents of schools constitute the board of superintendents. Teachers are chosen by the board of education from lists of those who have qualified before a board of examiners of seven members appointed by the board of education. The total personnel of the department of education in 1950 was estimated at more than 45,700. Expenditures of the city for educational purposes in 1950–51 amounted to $270,511,174.37, of which $82,192,336 was appropriated by the state toward the payment of teachers' salaries. A teachers' retirement system is administered by the teachers' retirement board of seven unpaid members.

Higher Educational Facilities.—The city provides such facilities in the College of the City of New York including City college, Hunter college (women), Brooklyn college and Queens college. City college was established as the Free academy in 1847. The name was changed to the present one in 1929. The college occupies buildings of English Gothic style, constructed at a cost of more than $5,000,000, and a modern structure in lower Manhattan which houses its business school. Its enrolment in 1950 was in excess of 30,000, while its teaching staff was almost 1,000. Hunter college for women, originally intended as a teacher training school, was founded in 1870 as the "normal and high school." Free to women residents of the city, its enrolment in 1950 numbered 12,000, its staff more than 700. In addition, New York is the seat of Columbia university (*q.v.*) and New York university, which was founded in 1831. In 1835 it moved to Washington square, and in 1891 added a site of about 48 ac. on University heights in the Bronx. It enrols more than 36,000 students. Fordham university (7,000 men students) was founded in 1841 as St. John's college. In 1846 it was turned over to the Jesuits and incorporated. The name was changed to Fordham in 1907. It is situated in the Bronx. Long Island university in Brooklyn had in 1950 an enrolment of 4,500 students, chiefly in the schools of law and medicine. The year 1928 witnessed the opening of the present Yeshiva university (Jewish), which occupies new buildings of Ancient Semitic architecture situated in upper Manhattan. In 1950 it had almost 2,000 students. Among the more important of the professional schools are: the General Theological seminary (Protestant Episcopal); Union Theological seminary (Presbyterian); Jewish Theological Seminary of America; Cornell university medical college; Brooklyn Law school; the Institute of Public Administration; the New School for Social Research; and the professional schools of the various universities. The chief technical institutions are the Mechanics institute, founded in 1820; Cooper Union (*q.v.*); and Pratt and Polytechnic institutes, both in Brooklyn. The New York State Maritime college is at Fort Schuyler in the Bronx.

Libraries.—The first public library in New York was the Corporation library, established at the city hall (1697–1701). Up to 1795 it remained at the city hall and was the Library of Congress when New York was the nation's capital. It was later renamed the Society library. Other older libraries are: the Columbia university library (1754), that of the American Historical society (1804), and the Mercantile library, founded in 1820 by merchants' clerks. The municipal library system consists of the New York Public library, serving Manhattan, the Bronx and Richmond; the Brooklyn Public library and the Queens Public library. There are also numerous and important special libraries in the city.

Art.—Most of the principal American sculptors have at some time resided in New York and it is there, frequently in inconspicuous places, that one finds their masterpieces. Augustus Saint-Gaudens is represented by his "Peter Cooper," the equestrian statue of Sherman, the Admiral Farragut statue, the bronze relief of the Rev. Henry W. Bellows and other works; John Quincy Adams Ward, by the "Pilgrim," "Shakespeare," "Indian Hunter" and a monumental bronze Washington; Frederick W. MacMonnies by his "Nathan Hale," "Civic Virtue," "Horse Trainers and a Quadriga"; Daniel Chester French by the "Alma Mater"; George Gray Barnard by a fountain at Columbia; Karl Bitter by an "Abundance" and an equestrian statue of Franz Sigel; Anna Hyatt by a "Jeanne D'Arc"; Kirke Brown by an equestrian Washington; F. Auguste Bartholdi, the French artist, by a "Lafayette"; H. P. Proctor by a bronze group of panthers; and Edward Kemeys by a "Still Hunt." On the front of the Public library is Paul Bartlett's statue. A group by Albert Weinter depicting the purchase of Manhattan Island is in the city hall of records. The Statue of Liberty of Bartholdi, gift of France for the 100th anniversary of American independence, rises from Bedloe's Island 300 ft. above the harbour. (*See* LIBERTY, STATUE OF.) Modern U.S. sculpture is well represented by the works of such men as William Zorach, Jo Davidson and Isamu Noguchi.

The largest collection of art objects in America is in the Metropolitan Museum of Art. A vast number of paintings, statuary, metalcraft and other works of the masters are on display. Other museums of importance are the Whitney Museum of American Art, which exhibits works of U.S. artists of greater or lesser fame; the Museum of Modern Art, one of the world's most important sponsors of aesthetic experiment. Its retrospective exhibitions of almost all forms of modern graphic arts have attracted large audiences. The Guggenheim Museum of Non-Objective Art specializes in the collection of the form of art that gives it its title.

Aside from the public museums, the city has many famous art galleries where exhibitions of all forms of art may be viewed. Among the later important galleries is that of the Associated American Artists, an organization representing a large group of artists and sculptors. The Cloisters in Fort Tryon park, a branch of the Metropolitan Museum of Art, was a gift of John D. Rockefeller, Jr. It contains an outstanding set of Gothic tapestries, "The Hunt of the Unicorn."

Central and Prospect parks are adorned with many examples of fine statuary, and unfortunately, also, with many which are lacking in merit. Many sculptors are represented in the busts of great Americans in the Hall of Fame at New York university.

A few striking examples of 18th and early 19th century architecture remained at mid-century, notably St. Paul's chapel, designed by MacBean and built in 1764, the old church of St. Mark's-in-The-Bouwerie, completed in 1799, and city hall, the work of Joseph Mangen and John Macomb, completed in 1811. James Renwick designed the Gothic Grace church, completed in 1845, and St. Patrick's cathedral, which was built between 1858 and 1879. After the Civil War Richard M. Hunt, a graduate and teacher in the Paris School of Fine Arts, began his American career Among his first works were the Astor and Gerry houses and the *Tribune* building. George B. Post designed many beautiful residences, the *Times* and *World* buildings and the Produce and Cotton exchanges, Charles F. McKim, William R. Mead, and Stanford White were designers of the old Madison Square Garden, the Washington arch and the Metropolitan club. R. H. Robertson is known for his work on the American Tract Society and United Charities buildings. John Carrère and Thomas Hastings planned the National Academy of Design and the New York Public library; H. I. Hardenburg the Waldorf, Savoy and Manhattan hotels and the American Fine Arts building; and Ernest Flagg the Singer building, St. Luke's hospital and the Scribner building.

The art commission of the city of New York was established in 1898, being the first American municipal organization designed to protect a city against inferior structures and memorials.

Music.—In the first quarter of the 19th century, the Park theatre became a famous stage for dramatic and musical art. In the '40s and '50s the musical centre was Tripler hall on lower Broadway, which became Metropolitan hall in 1854 and then, following its destruction by fire shortly after, was rebuilt and rechristened the New York theatre and Metropolitan Opera house. Later its name was changed to the Winter Garden. The

present Metropolitan Opera house was built in 1883. In the latter half of the 19th century several other large halls for musical recitals were opened, notably, Steinway, Chickering, Hardman and Carnegie halls.

In the 20th century there was a growth of interest in all forms of musical activity, and many orchestras and musical societies were organized. There was a major shift in emphasis toward mass appreciation of fine music. Typical of the many new musical institutions were the Lewisohn Stadium concerts, played by the New York Philharmonic-Symphony orchestra and distinguished soloists before large crowds in the City college stadium.

Literature.—Cadwallader Colden, author of the *History of the Five Nations* (1730), was perhaps the first New York author of general reputation. The first authors' club, the Ancient Club of New York, was founded in the latter part of the 18th century and later included among its members Washington Irving, Fitz-Greene Halleck, James Kirk Paulding and Joseph Rodman Drake. A little later John James Audubon, Richard Henry Dana, James Fenimore Cooper, Edgar Allan Poe, William Cullen Bryant, John Bigelow, Julia Ward Howe and Robert Bonner were members of New York's literary life. In the 19th century the Bread and Cheese club brought together a most creditable group of writers. In the early 1920s Greenwich Village (*see* below) became the centre of American letters. During this period Edna St. Vincent Millay, Eugene O'Neill, Theodore Dreiser, among many made this part of New York their headquarters.

The influence of New York upon letters later declined somewhat although it remained the centre of American printing and publishing. The chief society of authors having headquarters in New York is the American Academy of Arts and Letters. Other notable literary organizations are the Society of Arts and Letters, Authors' guild, Catholic Writers' Guild of America, New York Drama league, American Dramatists, Grolier club, Century association and League of American Penwomen.

Scientific Collections and Learned Societies.—Chief of the scientific collections is that of the famed American Museum of Natural History. The zoological park in Bronx park is under the control of the New York Zoological society.

The botanical garden in Bronx park occupies about 400 ac. The museum contains a library, collections with about 1,800,000 specimens and research laboratories; its income comes from an endowment and from public funds. The Brooklyn Institute of Arts and Science (*q.v.*) maintains another large botanical garden.

The Hispanic Society of America, founded by Archer M. Huntington, maintains an excellent museum of Spanish and Portuguese paintings, manuscripts, maps, coins and antiquities. Other interesting collections are in the museum of the American Numismatic society, containing exhibits of medals and coins of all countries and of all periods, and the American Museum of Safety (industrial safety appliances).

The New York Historical society, founded in 1804, is the most important for material on New York state history. The Long Island Historical Society of Brooklyn and the New York Genealogical and Biographical association, founded in 1869, are notable in this field. The Quadrangle at Broadway and 156th street is the location of the American Numismatic society, the Geographical Society of New York, the Museum of the American Indian and Hispanic Society of America.

The New York Academy of Medicine, established in 1847, the Academy of Political Science at Columbia university, founded in 1880, and the New York metropolitan chapter of the American Society for Public Administration also deserve mention. (*See* SOCIETIES, LEARNED.)

GREENWICH VILLAGE

Bounded on the north by 14th street, on the south by Spring street, running west from Broadway, Greenwich Village is a roughly triangularly shaped segment of New York city perhaps most commonly thought of as a home of American arts and letters. It is associated with Bohemianism, radicalism, struggling artists and exotic night clubs and restaurants maintained chiefly for visitors. This atmosphere was a carry-over from the period before and after World War I, when the "Village" was locally considered the centre of the American literary and artistic renaissance. Although at mid-20th century the annual sidewalk art show persisted, and many artists still lived in the Village, the great had mostly moved away, and the Village had become a replica of other city areas. Some parts retained their ancient quaintness. Southwest of Sheridan square at mid-century was the maze of winding streets forming Bedford, Barrow, Grove and Commerce. There could be found the age-worn dwellings erected by the burghers in the late 18th and early 19th centuries. The slate-covered, steep-roofed houses with their old chimney pots, imposing entrances and ironwork were among the best examples of early Village homes.

Elsewhere in the Village the houses and mews—converted stables with their interior gardens—that gave the village its old-world look were rapidly being torn down. Washington square, at the foot of Fifth avenue, dominated by Washington arch, erected in 1892, was the last remaining vestige of the dignity and good taste of the early wealthy settlers who built here when Washington square was the centre of high society. Even this was gradually succumbing to the advances of skyscraper apartments and New York university. In 1950 and 1951 Rhinelander mansion and other fine old buildings along the northern border of the park were torn down. On the southern side of the park, "genius row," the homes of some of the country's best-known artists and writers, had also disappeared.

THEATRES, CLUBS AND CHURCHES

Theatres, Arenas and Exhibitions.—The first dramatic performances in New York were probably those given in a building in Pearl street by a company of actors from London in 1732. Another company from London came to New York in 1749. The real beginning of the permanent theatre in New York was, however, in 1750, when a company under the management of Kean and Murray came from Philadelphia and established themselves in a house on Kip street (now Nassau), between John street and Maiden lane. Lewis Hallam arrived in 1753 from Virginia and erected a theatre in Nassau street, the first building constructed for theatre purposes, and opened it in 1753 with *The Conscious Lovers* and *Damon and Phelleda*. The first performance of *Romeo and Juliet* was given at this theatre in 1754 with Mrs. Hallam as Juliet. This theatre was abandoned the same year and was converted into a church by a society of Calvinists. The next theatre was at Crugers wharf on the East river and was opened by David Douglass in 1758 with *Jane Shore*. Douglass also opened another theatre at the corner of Nassau and what is now Beekman street in 1761 with *The Fair Penitent* and later gave the first performance of *Hamlet* in New York; he also established the John Street theatre, in 1767.

This theatre flourished until the Revolution and during the British occupancy of the city was used for amateur theatricals. After the British evacuation, Washington and his generals were frequent patrons of this theatre.

In 1798 a three-story stone theatre, the Park, was created between Ann and Beekman streets on Park row, for Hallam and Hodgkinson. This building was a very magnificent one for its time, costing about $180,000. The story of the theatre in New York for the next 50 years is largely the story of the Park theatre. In 1837 New York had five theatres, the Park, Bowery, Olympic, Chatham and Richmond Hill. Palmer's Opera house was built in the '40s as was also the Astor Place Opera house, where the Astor Place riot occurred as the result of a dispute between friends of the U.S. actor Edwin Forrest and his English rival William Macready. Twenty-two persons were killed and 36 were wounded by the militia called to quell the disturbance. In 1850, P. T. Barnum brought Jenny Lind to the U.S. for a series of concerts which began at Castle Garden at the Battery. Similar "pleasure gardens," as Niblo's, the New York, Cold Springs, East River, Vauxhall and Ranleagh, were utilized for concerts and other performances for which the capacity of theatres was inadequate. The

Crystal palace in Murray Hill was also a great amusement centre in the early '50s.

By the middle of the century the theatrical district was well established in the neighbourhood of Union square, which was also the shopping centre.

The Academy of Music, the Union Square, Irving Place and Wallack's were the chief theatres in this area. By 1870 23rd street had become the upper limit of the theatrical and shopping centre, with the Fifth Avenue theatre and Booth's. Ten years later the theatres had invaded the lower '30s with Daly's, the Standard, Wallack's and the Casino. In 1883 the erection of the Metropolitan Opera house at 39th street started an invasion of the '40s and by the end of the century, 42nd street had become the real centre of the theatrical district as it is today. The present theatre district comprises roughly a strip of Manhattan extending from 14th to 59th streets, and from Fifth to Eighth avenues. Broadway cuts diagonally across the strip and in the language of the district is the "main stem" to which the cross streets are tributary.

In this area there are about 200 theatres, including those in which moving pictures are a part of the program. According to the best available data, there are in all 4,445 theatres in greater New York, including those exhibiting moving pictures as part of their entertainments. Among the largest are: Radio City Music hall (6,200), Roxy (5,920), the Capitol (4,845), the Academy of Music (3,600), Paramount (3,664) and the Metropolitan Opera house (3,418).

Most of the theatres exhibiting the legitimate drama or musical comedies only are of less than 2,000 capacity (*see* STADIUM). The total seating capacity of places of amusement is about 1,500,000. (*See* THEATRE.)

Clubs.—Club life in New York is less significant now than in the earlier part of the present century before the development of the apartment house hotels, the change in social habits and customs coincident with the expansion of business and trade into former residential districts and the exodus from the city into suburban areas of so many of the leisured class who formerly sought city clubs for recreation and entertainment. The first social organizations of importance were the authors' Bread and Cheese club (1824), and the artists' Sketch club (1829). It was not until 1836, however, that club life in New York really began with the founding of the aristocratic Union and Hone clubs. The Knickerbocker (1871) was also the resort of the descendants of original New York settlers. The St. Nicholas was formed a little later for those whose ancestors were early residents of the colonies.

The Metropolitan (1891), with its costly house, was in fact a protest against the exclusiveness of many of the older clubs. The Union League (1863) was established for the purpose of aiding the union, and its first work was the organization of regiments of Negro troops. To offset this Republican influence, the Manhattan was organized in 1864 to advance Democratic ideals, although this is not now greatly emphasized.

The chief sport and athletic clubs are the New York Yacht (1844), the New York Athletic (1868) and the Racquet and Tennis. Other important clubs with more or less specialized interests are the Advertising Club of New York, Automobile Club of New York, the Camera, Century, City, Colony, Engineers, Explorers, Harvard, Lambs, Yale, Lawyers, Lotos, Players and Salmagundi clubs.

Many of the great office buildings in downtown New York contain luncheon clubs, such as the Downtown association, the Lawyers, Bankers and Whitehall.

Churches.—The Dutch Reformed Church (1628) was the first church in the city and is today known as the Collegiate Church of New York city. The Presbyterians organized here as early as 1638 and were tolerated by the Reformed Church, but it was not until the English occupancy that they made their influence felt. In 1719, the first Presbyterian church was built in Wall street; there are about 100 today. It was not until 1847 that a Congregational church attained great prominence in New York, when the Plymouth Church of Brooklyn was founded with Henry Ward Beecher as pastor. The Congregationalists number about 50 active churches. In 1664, the Lutherans obtained permission from the English Gov. Richard Nicolls to establish a church. The first Lutheran church was at Broadway and Rector street; it was destroyed in the fire of 1776. The Lutheran church grew rapidly and had at mid-century nearly 200 churches and chapels. The Protestant Episcopal Trinity church was built in 1697 at Broadway and Wall street where the present Trinity (1846) stands. St. Paul's chapel (1766) at Broadway and Vesey street is the oldest church edifice in the city; Grace, St. Thomas', the Church of the Transfiguration, familiarly known as "The Little Church Around the Corner," and the great Cathedral of St. John the Divine, at 110th street and Morningside avenue, are other notable Episcopal churches. The first Methodist church (1768) was erected in John street. African Methodist Episcopal churches for Negroes have a large membership. The first Baptists in New Amsterdam (1657) received little consideration at official hands and met in a private house in Broad street in 1715. In 1762 they built a church in Gold street. They have about 120 churches, some of the largest being for Negroes. St. Peter's (1785) was the first Roman Catholic church and in 1808 New York was made the seat of an Episcopal see. In the years prior to the Civil War the Catholic Church grew rapidly. In 1858, the present St. Patrick's cathedral at Fifth avenue and 51st street was begun, and in 1879 it was dedicated. It is the 14th in size among cathedrals and seats about 4,500 persons. There are about 430 Catholic churches. Besides other Christian groups there are numerous flourishing Jewish congregations, some of them of considerable age. There are also a number of undenominational churches and missions.

NEW YORK FERN (*Dryopteris noveboracensis*), a beautiful North American fern of the shield-fern group. While named after New York, it is native to a much greater region, occurring in moist woods from Newfoundland to Minnesota and southward to Georgia and Arkansas.

The delicate fronds, 1 to 2 ft. high, rise on slender stalks (stipes) from widely creeping rootstocks.

(*See* SHIELD FERN.)

NEW YORK STATE BARGE CANAL SYSTEM consists of the Erie canal, the Champlain canal, the Oswego canal, the Cayuga-Seneca canal, Cayuga Lake inlet at Ithaca, the Glens Falls feeder and the lakes, reservoirs, feeders, harbour basins, and terminal docks facilities. The total length of the system is about 525 mi.

The total number of locks on the main channels of the improved canals, exclusive of the U.S. government lock at Troy, is 56. There are 34 locks on the Erie, 11 on the Champlain, 7 on the Oswego canal and 4 on the Cayuga and Seneca canal.

In addition, there are two junction locks and two guard locks.

Navigation is free and the usual navigation season is about seven months from early in April to Dec. 1. The canals are available for use 24 hours of the day. Boats about 300 ft. long, 42 ft. wide, with a draft of 10 ft. and a cargo capacity of 2,200 tons are generally used.

The Erie Barge canal is the main waterway, connecting the Hudson river at Troy with Lake Erie at Buffalo. It has a total length of 340 mi. and serves as the main route of transporting grain from the west to New York. It is 150 ft. wide and 12 ft. in depth. The cost of construction was $139,214,929.

The Cayuga and Seneca canal connects Montezuma, N.Y., with the Cayuga and Seneca lakes and affords communication between these lakes and the Erie canal. Including the lakes the length of the canal is 92 mi.; exclusive of the lakes, it is approximately 24 mi. It is 200 ft. wide and 12 ft. in depth. The cost of construction was about $8,154,000.

The Champlain canal connects Whitehall, N.Y., at the head of Lake Champlain with the Erie canal at Waterford, providing a waterway between the Atlantic seaboard and the navigable St. Lawrence. It is 60 mi. long, 125 ft. wide and 12 ft. in depth. The cost of construction was about $21,691,000.

The Oswego canal connects Lake Ontario at Oswego with the Erie canal at Syracuse and provides communication between Syracuse and Oswego and, by the use of the Welland canal, with the other Great Lakes. The cost of construction and improvement was about $12,000,000.

Through federal aid, the Erie canal from Waterford to Three River Point and the Oswego canal from its junction with the Erie canal at that point to its mouth at Oswego, the canal entrance at Lake Ontario, were being improved in order to provide for a channel depth of 14 ft. between locks.

This work includes the raising of fixed bridges to a minimum vertical clearance of 20 ft. above maximum navigable pool. The usual clearance provided under the fixed bridges spanning the canals is 15½ ft.

NEW ZEALAND, a member country or realm of the Commonwealth of Nations, consisting of a group of islands in the South Pacific. New Zealand proper, defined by letters patent of 1842 and an imperial act of 1863 as extending from 33° to 53° S. latitude and from 162° to 173° E. longitude, comprises: (1) the North and South Islands (44,281 and 58,093 sq.mi., respectively), cut asunder by Cook strait, a channel varying in width from 16 to 130 mi.; (2) Stewart (or Rakiura) Island (670 sq.mi.), separated from the southwest end of the South Island by Foveaux strait; (3) the Chatham Islands (372 sq.mi.), *c.* 420 mi. E.S.E. of Cook strait; and (4) a number of outlying minor islands included within the political boundaries of 1842. Of the minor islands (total area 307 sq.mi.), the Aucklands (234 sq.mi.), Campbell Island (44 sq.mi.) and the Antipodes (24 sq.mi.) are the principal; the Aucklands and Antipodes are uninhabited. About 925 mi. N.N.E. of Wellington (and thus just outside the 1842 boundary) are the volcanic Kermadecs (13 sq.mi.), annexed in 1887 and included in New Zealand proper. In Polynesia a number of inhabited islands were brought under New Zealand control in 1901. Rarotonga and Mangaia, in the Cook group (84 sq.mi.), and Niue or Savage (100 sq.mi.), of islands outside the Cook group, are the largest of these island territories. Rarotonga is hilly, well watered and very beautiful; Penrhyn and Suvarov (Suwarrow), small coral atolls outside the Cook group, contain excellent harbours. The Tokelau Islands (4 sq.mi.) were detached from the Gilbert and Ellice Islands colony and placed under New Zealand administration by an imperial order in council of 1925; by an act of 1948 they were finally made part of New Zealand's island territories. Total area of New Zealand (including island territories) 103,939 sq.mi.; of New Zealand proper (*i.e.,* excluding island territories) 103,736 sq.mi.

New Zealand also administers Western Samoa (main islands Upolu and Savai'i, 430 and 703 sq.mi. respectively), a United Nations trust territory, and the Ross dependency (about 175,000 sq.mi.), an antarctic region claimed by Great Britain in 1923. The island trust territory of Nauru (8 sq.mi.) is held jointly with the United Kingdom and Australia, although Australia undertakes the administration.

PHYSICAL FEATURES

The North Island is 515 mi. long from North cape to Cape Palliser in the south and varies in breadth from 6 to 200 mi. It is almost divided where the Hauraki gulf penetrates to within 6 mi. of Manukau harbour, south of Auckland. From the isthmus thus formed a narrow, very irregular peninsula reaches out northward for about 200 mi., moist and semitropical and beautiful rather than uniformly fertile. South of the Auckland isthmus the North Island rapidly broadens out. Its central physical feature is the series of unbroken mountain chains running northeastward from Cook strait to East cape, ranges seldom less than 3,000 ft. but never attaining 6,000 ft. in height. Hikurangi, their highest summit, though a fine mass, does not compare with the isolated volcanic cones which, rising west of the main mountain system and quite detached from it, are among the most striking sights in the island. Ruapehu (9,175 ft.) is intermittently active and Ngauruhoe (7,515 ft.) emits vapour and steam periodically. Egmont (8,260 ft.), in the west of the island, is quiescent; its symmetrical form and dense clothing of forest make it the most beautiful of the three. North of the two first-mentioned volcanoes Lake Taupo spreads over 238 sq.mi. in the centre of a pumice-covered plateau from 1,000 to 2,000 ft. above the sea; and round and beyond the great lake the region of the thermal springs covers 5,000 sq.mi. and stretches from Mt. Ruapehu to White Island, an ever-active volcanic cone in the Bay of Plenty. The most uncommon natural feature of the district, the Pink and White terraces, was blown up in the eruption of Mt. Tarawera in 1886, when for great distances the country was buried beneath mud and dust and a chasm 9 mi. long was opened. Fine lakes and waterfalls, innumerable pools, in temperature from boiling point to cold, geysers, solfataras, fumaroles and mud volcanoes attract tourists in large numbers. The healing virtue of many of the springs is widely known. The government maintains a sanatorium at Rotorua and Te Aroha, and there are private bathing establishments in other places, notably near Lake Taupo. (In the South Island there are hot pools and a state sanatorium at Hanmer Springs.) Though the overlying porous pumice reduces the fertility of the Taupo plateau, except under treatment, it has a good rainfall and is drained by unfailing rivers running through deep terraced ravines. The Waikato and Waihou (Thames) flow north, the Rangitaiki northeast, and Mokau, Wanganui, Rangitikei and Manawatu west or southwest. The first named, the longest river in the dominion, though obstructed by a bar like all western—and most eastern—New Zealand rivers, is navigable for about 70 mi. The Mokau and Wanganui run between ferny and forest-clad hills and precipices, often of great beauty.

East of the Taupo plateau and south of Opotiki on the Bay of Plenty are steep, thickly timbered ranges. On the southern frontier of this mountainous tract Waikaremoana extends its arms, the deepest and most beautiful of the larger lakes of the island.

From the mouth of the Waikato southward to about 25 mi. from Cape Terawhiti on Cook strait, and for a distance of from 20 to 40 mi. inland, the western coast skirts fertile grazing and dairy-farming country. On the east coast the same fertility is seen and, round Hawke bay, there is a hotter and drier summer. In the south centre, the upland plain of the Wairarapa has a climate ideal for grazing. The southern end of the island, rough though well grassed, is redeemed by the fine harbour of Wellington (formerly Port Nicholson), which is second only to the Waitemata (Auckland) as a commercial port. Everywhere the farmer may count on an adequate rainfall and—except on the plateau and the mountain highlands—mild winters and genial summers.

The dominating features of the South Island are not ferny plateaus or volcanic cones, but stern chains of mountains. The Southern Alps rise range upon range, almost touching the western shore and stretching from end to end of the island. In the southwest region, which has a heavy rainfall, there are many deep fjords which have been carved out by glacial action. One of these sounds, Milford, has become an important tourist centre,

but none of them, because of the difficult nature of the country, can be developed for settlement.

The South Island has two large and highly developed areas of flat country, the Canterbury plains and the Southland plains, which produce a large proportion of New Zealand's cereal crops. They are also important areas for the growing of root crops and the fattening of stock for export. The sunny valleys of the Nelson and Marlborough districts in the northern part of the South Island produce a large part of New Zealand's crops of apples and pears, hops and tobacco. Another important fruit-growing area is central Otago, which has the lowest rainfall in the country. The high country of the South Island has been developed for sheep rearing since the earliest days of settlement. The narrow coastal strip facing the Tasman sea, with its high rainfall, is particularly suited to dairy- and beef-cattle farming. Although the ports of the South Island handle a considerable overseas trade, good natural harbours are not as numerous as in the North Island.

There are many rivers even on the drier eastern coast; some are snow-fed and the rate of flow varies according to the season. The largest river, the Clutha, 154 mi. long (or 210 mi. from its true source at the head of the Makarora river), discharges a volume of water estimated at nearly 2,000,000 cu.ft. a minute. On the west the only two rivers of importance are the Buller and the Grey, the former justly famous for the grandeur of its gorges. Te Anau and Wakatipu (52 mi. long) are the chief lakes in the south though Manapouri is the most romantic. Mt. Cook is easily first among the mountain peaks. Its height, 12,349 ft., is especially impressive when it is seen from the sea off the west coast. On the northeast a double range, the Kaikouras, scarcely falls short of the Southern Alps in height and beauty. Apart from the fjords and lakes the chief beauties of the Alps are glaciers and waterfalls. The Tasman glacier is 18 mi. long and has an average width of $1\frac{1}{4}$ mi.; the Murchison glacier is 11 mi. in length. To the west of Mt. Cook the Franz Josef glacier crawls into the forest as low as 900 ft. above sea level. Among waterfalls the Sutherland is 1,904 ft. high, but has less volume than the Bowen and others. The finest mountain gorge, the Otira, is also the chief railway route from the east to the west coast. (A. T. CL.)

Geology.—New Zealand is part of the Australasian festoon on the Pacific edge of the Australasian arc. Because of its critical position it has had a particularly varied geological history, and includes, for its size, an unusually complete series of marine sedimentary rocks. It is still a matter of doubt whether Pre-Cambrian rocks constitute any portion of the islands. The oldest rocks, however, extend at intervals down the western side of the South Island. They include a complex of gneisses, schists and dioritic igneous rocks in Fiordland, and sillimanite gneisses on Stewart Island. The main mountain axis of the South Island is a one-sided structure, with a narrow belt of schists on the west and a broad zone of Palaeozoic and Mesozoic altered sediments on the east. This alpine axis is bounded to the west by the Alpine fault extending from Cook strait to south Westland and forming a complete structural division of the island.

Main Divisions.—The first evidence of life appears in rocks of Lower Ordovician age, forming a folded belt in the south at Preservation inlet and in the extreme northwest at Collingwood. They comprise graptolitic slates, quartzites and marbles, and are characterized by an Arenig fauna including *Tetragraptus, Bryograptus, Dichograptus* and *Didymograptus.* In Fiordland they pass north and east into metamorphic types and they appear to grade into the Fiordland gneisses.

In the Cobb-Takaka district, strata of Silurian age (Haupiri beds) extend north from the Cobb river in a wide belt to the Haupiri mountains. Lower Devonian rocks form an important series on the Baton river and at Reefton. The fauna consist of brachiopods, a few trilobites, lamellibranchs, corals and *Bryozoa,* the beds now being assigned to the Upper Siegenian or Lower Coblenzian.

Much of the highlands are built up of folded greywackes, slates and some limestone, with a volcanic horizon recognized near the base of this folded series. The whole is divided into a Permian (Te Anau and Maitai) series and a Mesozoic (Hokonui) series. The nature of the junction between the two is still little understood, various authorities claiming a complete conformity, much regression or marked diastrophism with plutonic (dioritic) intrusions.

In the type locality (Nelson district) the Maitai series (limestones, shales and slates) contain *Platyschisma, Strophalosia, Martiniopsis* and *Spirifer bisulcata,* a fauna characteristic of the Permian beds of eastern Australia. An extensive series of basic breccias (Te Anau series) forms the base of the Maitai series upon which the fossiliferous sediments rest. The top of the series is formed of greywackes, in places containing annelid tubes (*Terebellina*). These are referred to a Lower Triassic age. This Permian series has a wide distribution in the South Island. The succeeding events are not clear. Probably there followed a regression of the sea, succeeded in turn by a transgression when the Hokonui beds were laid down. The base of this series is of middle Triassic age, these beds being followed by Upper Trias. They include the Carnic, Noric and Rhaetic stages, the sediments being greywackes, limestones, a horizon of basic tuffs (Noric) and Rhaetic plant beds. The sequence or portions of it are recognized from both the South and North Islands.

The Noric beds, characterized by an abundance of *Pseudomonotis,* have a very wide distribution, extended throughout the Southern Alps in Canterbury, along the Hokonui hills, in the Nelson district and in the Mokau district of North Taranaki. The series extending from the middle Trias to the Rhaetic is of great thickness, of the order of 10,000 ft. The beds are followed conformably by Jurassic feldspathic sandstones, conglomerates, plant beds and some thin coal seams. Liassic, Bajocian and also Upper Jurassic marine faunas have been described. A widespread series of sediments containing *Inoceramus* occurs in the east of the North Island, probably, in part, of Upper Jurassic age, but extending into the Lower Cretaceous. The problematical schists of the South Island, well developed in the Otago region and referred to as the Otago schists, are perhaps of Mesozoic age, though they have been referred to horizons from the Archaean to the Jurassic. They appear to pass outward into sediments indistinguishable from Ordovician or Mesozoic strata.

At the close of this sedimentation, in Lower Cretaceous times, a strong orogenic movement supervened, in which the Hokonui system was folded along meridional lines, the earth movements being accompanied by widespread plutonic intrusions throughout the length of New Zealand. The dunite sills of the Dun mountain region and the gabbros and norites of North cape belong to this epoch, as perhaps do also some of the diorites of the southwestern district of the South Island. The most intense folding in the North Island is developed in the east; in the west the flexures become more open and undulating strata predominate. In the Otago region, the Otago schists have recently been interpreted as a flat lying series forming a packet of recumbent folds, the participating rocks being referred to members of the Maitai and Hokonui series.

Following the Hokonui diastrophism a series of sediments ranging from middle Cretaceous to Upper Pliocene was deposited, but the record has received diverse interpretations, particularly in regard to the structural relations of the beds and the correlation of formations in neighbouring regions. According to the view of P. Marshall, the whole series is conformable throughout, a difference in age of the basal strata in different districts being ascribed to overlap over an irregular surface of the older rocks. Summarily, the sequence of formations is as follows:

Middle Cretaceous (Albian)		Marine beds (in Kaikoura ranges)
Upper Cretaceous	Senonian	Greensands, basal coal measures
	Danian	Limestones (partly foraminiferal)
Eocene		Marine beds and coal measures
Oligocene, Miocene		Marine beds
Pliocene		Marine beds and gravels

The oldest rocks of this sequence are developed in the Kaikoura mountains of Marlborough, where a thickness of from 3,000 to 9,000 ft. of sandstones and mudstones, with conglomerates and some coal measures, were deposited. These Albian beds are followed by the Amuri limestones (2,500 ft.), but in Canterbury and

the coast of Marlborough Senonian strata underlie the limestone series. In the succeeding Eocene period the coal measures of the southwestern district of the South Island were formed and constitute the most valuable coal seams of New Zealand. The transgressions of Oligocene and Miocene times submerged much of both South and North Islands, but in the central region of Otago the land remained emergent. Fluviatile and lacustrine deposits, however, covered large parts of this area. They are frequently auriferous. A general retreat of the sea from the South Island took place in Pliocene times, but the North Island remained largely below sea level. In the Wanganui area a wonderful development of clays, 3,500 ft. thick, was deposited, apparently without break. The present topography of New Zealand developed as a result of important crust warpings and block faulting. The faults are not simple tensional movements, but involved strong lateral pressure, in which overthrusting and overfolding are developed. The isoclinally folded Tertiary rocks of the Lake Wakatipu region show particularly well the extreme effects of this movement. The earliest development of vulcanicity after the post-Hokonui orogeny is seen in the middle Cretaceous basalts of the Clarence region and the Upper Cretaceous rhyolites near Christchurch. Vulcanicity became more widespread in mid-Tertiary times. To this period belong the pillow lavas and tuffs of the Oamaru district and the rhyolites, andesites and dacites of the Coromandel peninsula. Propylitization of these andesitic rocks gave rise to the auriferous deposits of this latter area. Somewhat later came the alkaline eruptions of the Dunedin district and the basalts forming Banks peninsula. The alkaline rocks of the former area include a varied succession of alkaline trachytes, phonolites, trachydolerites and basalts.

Volcanic activity of Upper Tertiary time extending to the present day led to extensive eruptions of andesites and rhyolites in the North Island. Mt. Egmont consists largely of andesite. The main centres of activity lie on a northeast line of crustal weakness extending from Ruapehu to Mt. Edgecumbe, and the great rift of the Tarawera eruption extending to Lake Rotomahana has a similar trend. The great rhyolite plateau in the Taupo region is built largely of welded tuffs or "ignimbrites," representing white-hot volcanic ashes which became welded as they accumulated and developed jointing as they cooled.

Study of the fossil fauna and flora of the New Zealand region points from many lines of evidence to intimate connection, in Mesozoic times, between this land, Australia and Malaysia. In the later Cretaceous period the connection between Australia and New Zealand was severed, though the latter was directly associated with Antarctica. The complete isolation of the New Zealand region seems to have been accomplished by middle Tertiary time, by a gradual breakup of the circumpacific connections.

Climate.—The main islands of New Zealand extend through more than 12° of latitude, but contrasts of climate are modified by the influence of ocean currents and prevailing winds.

Table I gives some important data.

Table I.—*New Zealand Climate Data*

Station	Mean temp. (° F.)		Rainfall	
	Jan.	July	Total	Remarks
Auckland	66.3	51 2	45.3	Greater in winter
Rotorua	66.2	47.5	55.2	Greater in winter
Napier	64.8	47.3	35.2	Greater in winter
Wellington	60.9	47.2	47.5	Greater in winter
Nelson	61.5	45.0	38.0	Greater in winter
Hokitika	59.0	44.0	114.3	Spring often wettest
Lincoln (near Christchurch)	60.3	42.5	25.6	Generally distributed
Dunedin	58.6	39 5	37.0	Generally distributed
Ophir (central Otago)	62.3	36.9	17.6	Spring often wettest
Invercargill	57.0	41.4	45.3	Spring often wettest

The range of mean temperatures is small, the rainfall moderate save on the west slopes of the Southern Alps. The snow line reaches down to 3,000 ft. on the eastern side of the Southern Alps, which has rather lower temperatures than other parts, but on the western side it is at 3,700 ft. Nelson, sheltered from the west, is famed for its sunny climate with cool bracing nights.

The winter maximum of rainfall in the north is affected by prevailing winds and the all-year-round distribution of the light rainfall on the east side of the South Island contrasts with the tendency to a spring maximum on the western and southern fringes of the Southern Alps. Heavy rainfall on the west has allowed glaciers to exist and to reach down into the lowlands in some places in spite of the general mildness. The mountainous Stewart Island has about 65 in. of rainfall a year. (A. T. Cl.)

Vegetation.—There are about 1,000 species of flowering plants, of which about three-quarters are endemic. Most of those not peculiar to the country are Australian; others are South American, European and antarctic; and some have Melanesian affinities. Ferns and other cryptogamic plants are in great variety and abundance. The New Zealand flora, like the fauna, has been cited in support of the theory of the remote continental period.

The early colonists found at least half the surface of the archipelago covered with dense evergreen forest, a luxuriant growth of pines and beeches, tangled and intertwined with palms, ferns of all sizes, wild vines and other lianes and a rank, bushy, mossed undergrowth. Though much of the timber is of commercial value —notably the kauri pine (*Agathis australis*), totara (*Podocarpus totara*), puriri (*Vitex lucens*), rimu (*Dacrydium cupressinum*), matai (*Podocarpus spicatus*) and kahikatea (*P. dacrydioides*)—this has not saved the forests from wholesale, often reckless, destruction for settlement purposes. In late years active operations by the state, private companies and the settlers themselves, in reafforestation with European, Californian and Australian softwoods, have been doing much to restore the earlier ravages. These improvements are mainly in the naturally open and grassy regions of the eastern side of both main islands.

Bibliography.—R. M. Laing and Ellen W. Blackwell, *Plants of New Zealand*, 4th ed. (Christchurch, Oxford, 1940); W. Martin, *The Flora of New Zealand*, rev. ed. (Christchurch, 1940); E Richards, *Our New Zealand Trees and Flowers*, 2nd ed. (Christchurch, 1949).

Fauna.—In their natural state the islands had no land mammals except for two species of bat. The Polynesians brought a dog, now extinct, and a black rat, now very rarely seen. The wild dogs and pigs in outlying districts are descendants of domestic animals which have escaped into the bush. There are no land snakes. Of the two bats, one (*Mystacops tuberculatus*) belongs to a peculiar genus and one (*Chalinolobus morio*) is related to Australian and South African forms.

New Zealand is rich in birds, with 23 native species, some of which show Malayan affinity from before the isolation of the islands. The tui and the bellbird or makomako are famed as songsters, while the flightless and weak-winged birds are numerous: the kiwi (*Apteryx*), kakapo (*Strigops habroptilus*), takahe (*Notornis*) cannot fly. New Zealand formerly had 20 species of the gigantic running bird called the moa (*Dinornis*), a huge rail (*Aptornis*) and other bird types now extinct. The earlier destruction of the forests had disastrous effects on bird life. In the Alps a hawklike green parrot, the kea, which has been known to kill sheep, holds its ground. The pukeko, a handsome rail, abounds in swamps. The principal animal pests are deer, opossums and rabbits.

The most famous New Zealand animal, scientifically, is the tuatara (*Sphenodon punctatus*), the sole survivor of the reptilian order of the Rhynchocephalia, otherwise extinct since Mesozoic times so far as is known. This creature, lizardlike in appearance, grows to about two feet in length. The butterflies are few (only 16 species) and moths numerous (more than 1,200 species) and there is a poisonous native beach spider called katipo. An organism called *Peripatus* (*see* Onychophora) has a New Zealand species; it is intermediate in structure between the annelids and the arthropods and species occur in various isolated regions, mostly in southern lands.

Resolution, Kapiti and Little Barrier islets have been set aside as sanctuaries for the native fauna.

The minute young *Galaxias attenuatus* or native trout is fished as whitebait in tidal waters; and flounders are taken in salt or brackish lagoons and estuaries. Oysters, both mud and rock, are good and plentiful. Sharks are found everywhere and are common around the north; they rarely attack man. The albatross is the most conspicuous sea bird. Various penguins are found, the king penguin being confined to the Macquarie Islands.

HISTORY

Even the approximate date of man's arrival in New Zealand is uncertain. All that can be safely asserted is that by the 14th century A.D. Polynesian canoemen had reached its northern shores in successive voyages. By 1642 they had spread to South Island, for there Abel Janszoon Tasman found them when, in the course of his circuitous voyage from Java in the "Heemskerk," he chanced upon the archipelago, coasted along much of its western side, though without venturing to land, and gave it the name it still bears. One hundred and twenty-seven years later, Capt. James Cook, in the barque "Endeavour," gained a much fuller knowledge of the coasts, which he circumnavigated, visited again and again and mapped out with fair accuracy. He annexed the country, but the British government disavowed the act. After him came other navigators, French, Spanish, Russian and American; and, as the 18th century neared its end came sealers, whalers and trading schooners in quest of flax and timber. English missionaries, headed by Samuel Marsden, landed in 1814, to make for many years but slow progress. They were hindered by murderous tribal wars in which muskets, brought in first by the chief Hongi, more than decimated the Maori. Still, cruel experience and the persevering preaching of the missionaries gradually checked the fighting, and by the year 1839 peace and Christianity were in the ascendant. So far the British government had resisted any pressure brought to bear in Downing street in favour of annexation. In vain Edward Gibbon Wakefield, organizer of colonizing associations, prayed and intrigued for permission to repeat in New Zealand the experiment tried by him in South Australia. Lord Glenelg, the colonial minister, had the support of the missionaries in withstanding Wakefield's New Zealand company, which at length resolved in desperation to send an agent to buy land wholesale in New Zealand and dispatch a shipload of settlers thither without official permission. Before, however, the "Tory" had thus sailed for Cook strait, it had become known to the English government that a French colonizing company—Le Compagnie Nanto-Bordelaise—was forming, under the auspices of Louis Philippe, to anticipate or oust Wakefield. With the assent of the Protestant missionaries the British authorities reluctantly instructed Capt. William Hobson, R.N., to make his way to northern New Zealand with a dormant commission of lieutenant governor in his pocket and authority to annex the country to Australia by peaceful arrangement with the natives. Hobson landed in the Bay of Islands on Jan. 22, 1840, hoisted the Union Jack and had little difficulty in inducing most of the native chiefs to accept the queen's sovereignty at the price of guaranteeing to the tribes by the treaty of Waitangi possession of their lands, forests and fisheries. Some French settlers, convoyed by a man-of-war, reached Akaroa in South Island in the following May. But Hobson had forestalled them, and those who remained in the country became British subjects. Meanwhile, a week after Hobson's arrival, Wakefield's colonists had sailed into Port Nicholson, and proposed to take possession of immense tracts which the New Zealand company claimed to have bought from the natives, and for which colonists had in good faith paid the company. Other bands of the company's settlers in like manner landed at Nelson, Wanganui and New Plymouth, to be met with the news that the British government would not recognize the company's purchases. Then followed weary years of ruinous delay and official inquiry, during which Hobson died after founding Auckland. His successor, Robert Fitzroy, drifted into an unsuccessful native war. A strong man, Capt. (later Sir) George Grey (*q.v.*), was at last sent over from Australia to restore peace and rescue the unhappy colony from bankruptcy and despair. Grey, much the best of the absolute governors, held the balance fairly between the white and brown races and bought large tracts of land for colonization, including the whole South Island, where the Presbyterian settlement of Otago and the Anglican settlement of Canterbury were established.

SELF-GOVERNMENT

In 1852 the mother country granted self-government and, after much wrangling and hesitation, a full parliamentary system and a responsible ministry were set going in 1856. For 20 years thereafter the political history of the colony consisted of two long, intermittent struggles—one constitutional between the central government (first seated at Auckland, but after 1865 in Wellington) and the powerful provincial councils, of which there were nine charged with important functions and endowed with the land revenues and certain rating powers; the other racial.

The Maori Wars.—The native tribes, brave, intelligent and fairly well armed, tried, by means of a league against land selling and the election of a king, to retain their hold over at least the central North Island. But their kings were incompetent, their chiefs jealous and their tribes divided. Their style of warfare, too, caused them to throw away the immense advantages which the broken bush-clad island offered to clever guerrilla partisans. They were poor marksmen, and had but little skill in laying ambuscades. During ten years of intermittent marching and fighting between 1861 and 1871 the Maori did no more than prove that they had in them the stuff to stand up against fearful odds and not always to be worsted. Round Mt. Egmont, at Orakau, at Tauranga and in the Wanganui jungles, they more than once held their own against British regiments and colonial riflemen. The storming of their favourite positions—stockades strengthened with rifle pits—was often costly; and a strange anti-Christian fanaticism, the Hau-Hau cult, encouraged them to face the white men's bullets and bayonets. But even their fiercest fighting leaders, Rewi and Te Kooti, scarcely deserved the name of general. Some of the best Maori fighters, such as the chiefs Ropata and Kemp, were enlisted on the white side, and with their tribesmen did much to make unequal odds still more unequal. Had Gen. Thomas Pratt or Gen. Duncan Cameron, who commanded the imperial forces from 1860 to 1865, had the rough vigour of their successor, Gen. Trevor Chute, or the cleverness of Sir George Grey, the war might have ended in 1864. Even as it was the resistance of the Maori was utterly worn out at last. After 1871 they fought no more. The colonists too, taught by the sickening delay and the ruinous cost of the war to revert to conciliatory methods, had by this time granted the natives special representation in parliament. A tactful native minister, Sir Donald McLean, did the rest. Disarmament, roads and land purchasing enabled settlement to make headway again in the North Island after 12 years of stagnation. Grey quarrelled with his masters in Downing street, and his career in the imperial service came to an end in 1868. His successors, Sir George Bowen, Sir James Ferguson, the marquess of Normanby and Sir Hercules Robinson, were content to be constitutional governors and to respect strictly the behests of the colonial office.

Sheep Farming and the Discovery of Gold.—Meanwhile the industrial story of New Zealand may be summed up in the words wool and gold. Extremely well suited for sheep farming, the natural pastures of the country were quickly parcelled out into huge pastoral crown leases, held by prosperous licensees, the squatters, who in many cases aspired to become a country gentry by turning their leases into freeholds. So profitable was sheep farming seen to be that energetic settlers began to burn off the bracken and cut and burn the forest in the North Island and sow English grasses on the cleared land. In the south artificial grassing went on for a time hand in hand with cereal growing, which by 1876 seemed

likely to develop on a considerable scale, thanks to the importation of American agricultural machinery, which the settlers were quick to utilize. Even more promising appeared the gold fields. Gold had been discovered in 1852. Not, however, until 1861 was a permanent field found—that lighted upon by Gabriel Read at Tuapeka in Otago. Thereafter large deposits were profitably exploited in the south and west of South Island and in the Thames and Coromandel districts of the Auckland province. Gold mining went through the usual stages of alluvial washing, deep sinking, river dredging and quartz-reef working. Perhaps its chief value was that it brought many thousand diggers to the colony, most of whom stayed there. Pastoral and mining enterprise, however, could not save the settlers from severe depression in the years 1867 to 1871. War had brought progress in the north to a standstill; in the south wool growing and gold mining showed their customary fluctuations. For a moment it seemed as though the manufacture of hemp from the native *Phormium tenax* would become a great industry. But that suddenly collapsed, to the ruin of many, and did not revive for a number of years.

In 1870 peace had not yet been quite won; industry was depressed; and the scattered and scanty colonists already owed £7,000,000 sterling. Yet it was at this moment that a political financier, Sir Julius Vogel, in that year colonial treasurer in the ministry of Sir William Fox, audaciously proposed that the central government should borrow £10,000,000, make roads and railways, buy land from the natives and import British immigrants. The house of representatives, at first aghast, presently voted £4,000,000 as a beginning. Coinciding, as the carrying out of Vogel's policy did, with a rising wool market, it for a time helped to bring great prosperity, an influx of people and much genuine settlement. A total of £14,000,000 of borrowed money, spent in ten years, was on the whole well laid out.

But prosperity brought on a feverish land speculation; prices of wool and wheat fell in 1879 and went on falling. Faulty banking ended in a crisis, and 1879 proved to be the first of 16 years of almost unbroken depression. Still, eight prosperous years had radically changed the colony. Peace, railways, telegraphs (including cable connection with Europe), agricultural machinery and a larger population had carried New Zealand beyond the primitive stage. The provincial councils had been swept away in 1876, and their functions divided between the central authority and small local bodies. Politics, cleared of the cross issues of provincialism and Maori warfare, took the usual shape of a struggle between landed wealth and radicalism. Sir George Grey, entering colonial politics as a Radical leader, had appealed eloquently to the workpeople as well as to the Radical "intellectuals," and though unable to retain office for very long he had compelled his opponents to pass manhood suffrage and a triennial parliaments act. A national education system, free, nonreligious and compulsory, was established in 1877. The socialistic bent of New Zealand was already discernible in a public trustee law and a state life insurance office. But the socialistic labour wave of later years had not yet gathered strength.

Sixteen years of depression, from 1879 to 1895, were followed by 26 years of great prosperity and in turn by 6 years of depression again, from 1921 to 1927. The slump conditions which prevailed in the 1880s (caused by a fall in the world price level) intensified the political atmosphere. In politics nearly 12 years of Conservative government were succeeded by 20 years of radicalism. The main aim of the legislation, which evoked world-wide interest, was social justice. Up to Jan. 1891 the Conservative forces controlled the country and for ten years progressive legislation was confined to a mild experiment in offering crown lands on perpetual lease, with a right of purchase (1882), a still milder instalment of local option (1881) and an ineffective Factories act (1886). In Sept. 1889, however, Sir George Grey succeeded in getting parliament to abolish the last remnant of plural voting. Finance otherwise absorbed attention; by 1890 the public debt had reached £38,000,000, against which the chief new asset was 1,300 mi. of railway, and though the population had increased to 650,000, the revenue was stagnant. (W. P. Re.; X.)

During the years 1879–90, the leading political personage was Sir Harry Atkinson. In Dec. 1890 he was overthrown by the progressives under John Ballance. Atkinson's party never rallied from this defeat, and a striking change came over public life, though Ballance, until his death in April 1893, continued the prudent financial policy of his predecessor. The change was emphasized by the active intervention in politics of the trade unions. These bodies decided in 1889 and 1890 to exert their influence in returning workmen to parliament, and where this was impossible, to secure pledges from middle-class candidates. The number of labour members elected to the general assembly was small, never more than six during more than 20 years, and no independent labour party of any size was formed. But the influence of labour in the progressive or, as it preferred to be called, Liberal party, was considerable and the legislative results noteworthy. Ballance directed his energies to constitutional reforms and social experiments. These in general did not interfere with the general lines of Atkinson's strong and cautious finance.

On Ballance's death in 1893, his place was taken by Richard Seddon, who put through the bill of that year granting woman suffrage; in 1919 women became eligible as parliamentary candidates. The Advances to Settlers act, 1894, inaugurated a series of schemes of state moneylending to farmers on mortgage of freehold or leasehold land; most classes of such advances were later administered by the State Advances corporation, created in 1936. Workers' wages were first safeguarded by the Truck act, 1891, and a series of acts between 1892 and 1899 aimed at making the payment of wages more certain and secure and at limiting creditors' rights to attach future earnings. Subsequently this code was consolidated into the Wages Protection and Contractors' Liens act, 1908, and that was superseded by a measure of like title in 1939.

The keystone of the regulative system was laid by the passing of the Industrial Conciliation and Arbitration act, 1894, under which disputes between employers and unions of workers were compulsorily settled by state tribunals; these, the arbitration courts, were empowered in 1898 to prescribe minimum rates of wages; and an amendment in 1903 prohibited any employer, worker, union of employers or union of workers from taking proceedings to defeat any of the provisions of an award during its currency. The Old-Age Pensions act, 1898, a pioneer measure in British countries, was the precursor of several in an outstanding program of social security. In 1898, also, the municipal franchise was greatly widened. Borrowing on a larger scale was begun in 1895, and in 12 years twice as many millions were added to the public debt. The general election of 1899 was the most languid held in 15 years, for politics ceased to be the chief topic of interest after New Zealand sent troops to serve in the South African War.

A marked commercial revival had taken place, mainly caused by the steady conversion of the colony's wastelands into pasture; the development of frozen meat and dairy exports, following the successful introduction of refrigeration to shipping in 1882; the continuous increase in the output of coal; the invention (in New Zealand) of gold dredging; the revival and improvement of hemp manufacture; the exploiting of the deposits of kauri gum; the reduction in the rates of interest on mortgage money; and a general rise in wages, obtained without strikes, which increased the spending power of the working classes. Commercial confidence was restored by the reconstruction of the Bank of New Zealand in 1895, and activity was stimulated by large public loans, while more cautious banking and the systems of taxation and rating on land values contributed to check land speculation.

The Liberal party headed by Ballance, Seddon and Sir Joseph Ward held office without a break for 21 years, mainly because of the general support given to its agrarian and labour policy by the smaller farmers and the working classes. In 1912 it fell, and the more conservative side, which by then had taken the title of Reform party, at last returned to office. The farmers, who had been organized into a powerful union, sought to destroy the liberal system of state tenancy in favour of freehold tenure with complete right of sale under a cheap and speedy land transfer law. The Reform party was prepared to give them this and numbers of them joined it. At the same time labour began to break away from the Liberals, under whose regime very few labour leaders had gained seats in parliament. After 1910 New Zealand labour followed the

example of Australia in creating its own party and, though serious strikes occurred in 1913, 1916 and 1921–22, the dominion remained on the whole industrially pacific.

Period of World War I.—In 1914 came World War I and a coalition ministry of Reformers and Liberals was formed in which William Ferguson Massey, the prime minister, had the help of Sir Joseph Ward as finance minister. New Zealand was not unprepared to be of service in wartime. A law passed in 1909 paved the way for compulsory training of the militia. Volunteers for service overseas came forward with enthusiasm and their fine physiques, initiative and self-reliance were qualities which distinguished the New Zealand contingents.

Heavy taxation and other severe war measures had to be endured in the dominion. Largely by forced loans from the banks and others direct from the taxpayers, £55,000,000 were borrowed internally. The output of gold and the chief products of food and raw materials were commandeered at war prices for the imperial government. The war debt, for the size of the population enormous, finally exceeded £81,500,000; but the interest on it was punctually paid. The £26,340,245 owing to the British government in 1922 because of war expenditure was funded, and funded-debt payments continued until 1931 when the British government, following the Hoover proposals, voluntarily suspended these obligations of New Zealand. At the peace New Zealand received a League of Nations mandate to administer Western Samoa.

Social legislation was more or less at a standstill in wartime but an important change was made in the liquor law. Local option was abandoned in favour of a triennial poll for and against national prohibition, which might be voted by a bare majority. Maintenance of the *status quo* was increasingly favoured in successive polls.

Between World Wars I and II.—Peace in 1918 was followed by three years of feverish activity and a wild speculation in rural land. When a very sudden fall of prices in 1921 stopped the orgy, the reaction was extremely severe. Thousands had mortgaged themselves in buying freeholds without adequate capital, nearly 1,000 farmers sought the bankruptcy court in the seven years 1921–27, and a large number had to part with their holdings. Because of rural embarrassment, a law of 1919 providing for a moratorium in the case of mortgages, other than trade mortgages, and of deposits, other than bank deposits, was continued until 1927.

The government had also to deal with many thousands of demobilized soldiers without employment. Pensions were bestowed on a liberal scale and more than 9,000 soldiers were settled on the land. There was a good deal of miscalculation, disappointment and failure in this scheme of military settlements. In 1936 soldiers' mortgages were transferred to the State Advances corporation. The Small Farms Amendment act, 1940, provided for settlement on the land of soldiers who had served in World War II, giving them absolute preference over all other applicants for land made available for selection under the legislation of 1932–33. With a view to protecting soldier settlers against the inflation of land values which ensued after the previous war, the Servicemen's Settlement and Land Sales act, 1943, controlled the price at which land could be sold or leased.

In 1919 the Liberal ministers withdrew from the coalition government, and the Reformers continuing in office had to meet industrial depression by economies in expenditure. The general elections of 1922 left Massey with a bare majority in the house of representatives, but the hopeless division of Labour from the Liberals enabled the Reformers just to hold their ground. Massey, the veteran premier who had led the Reformers to victory in 1912, died in 1925.

Following the 1925 general election the premiership went to Joseph Gordon Coates, newly elected leader of the Reform party, a comparatively young Auckland farmer. The elections proved to be the most complete triumph ever gained by a conservative party in the dominion. Labour won but 12 seats, but subsequently gained some by-elections and became the official opposition.

As a result of the encouragement given to farming, pastoral production constantly expanded, so that New Zealand had become one of the world's largest exporters of pastoral produce. As a consequence, its national income was extremely sensitive to price fluctuations of these products; so that, with the advent of the world-wide financial depression in 1930, its economic position became most vulnerable. Measures adopted during 1930–35 to help the farmers were numerous and often of a drastic character. The steps taken included the raising of the exchange rate, so that £N.Z.125 equalled £100 sterling; the adjustment of mortgages and farm indebtedness; the lowering of interest rates and farm costs; remission of certain rates and taxes; abolition of the graduated land tax; and the subsidization of farm labour.

Although New Zealand had obtained a unitary constitution in 1870, the country retained the status of a colony until Sept. 26, 1907, when it became a dominion. In common with the other dominions, representatives of the country shared in the direction of Great Britain's part in World War I, and in accordance with the independent status which it had attained, New Zealand was a signatory to the peace treaties and became a member of the League of Nations. As member of the British group of nations it signed the 1928 General Act for the Pacific Settlement of International Disputes (the "Kellogg pact") and the London naval treaty of 1930, and it was an individual signatory to the naval treaty signed in London in 1936. The New Zealand parliament approved in 1931 the draft Statute of Westminster (*q.v.*), which gave legal recognition to the autonomy of the dominions; New Zealand (in common with Australia and Newfoundland) requested that the operative parts of the statute should not become applicable until adopted by its own legislature. This step was not deemed necessary until 1947.

Sir Joseph Ward became prime minister in Dec. 1928, was succeeded in May 1930 by George William Forbes, and in 1931 the latter formed a coalition administration. At the Imperial Economic conference in Ottawa, Ont., in 1932 New Zealand agreed to more liberal tariff preferences for goods of British origin, and these were given legislative effect in 1934. Because of a worsening economic condition, there was a general reduction of 10% in wages and salaries in 1931, and the next year reductions were effected in pensions, salaries of state employees, rent, interest rates and other fixed charges. Such was the condition of the country at the time that between 1931 and 1935 there was a net exodus from New Zealand of 9,918 persons.

At the general election in 1935 the Labour party came into office under the premiership of Michael Joseph Savage, the party winning 53 seats against 20 for the National party (formed by the coalition of the Liberals and Reformers in 1931) and 7 held by Independents. Much legislation of the highest importance followed. The Reserve Bank of New Zealand, which had been established in 1934, was nationalized in 1936, the government subscribing the capital of £500,000 previously held privately. The government became the sole purchaser of dairy products for export, and their sole marketer, guaranteeing fair prices to the farmers for their butter and cheese. An amendment to the Arbitration act in 1936 restored the powers of the arbitration court, fixed basic wages and decreed a 40-hour week for industry, while a government bureau of industry was invested with wide powers for industrial planning. In 1936 free postprimary education was made available to every child. Most existing schemes of government advances for farming and industry were placed under the administration of the State Advances corporation, created in 1936, and the government embarked upon an ambitious scheme of building houses to be rented to workers.

In 1936 the prohibition against election of public servants to the house of representatives was removed (though, if elected, they ceased to be public servants), and with repeal of legislation of 1932 trade unions and like societies once more were permitted to use their funds for political purposes. The customary three-year life of parliament was extended to five years during World War I and, because of the acute economic crisis, to four years during 1934–37; in 1941, during World War II, the term of the 26th parliament was extended to four years. Parliament passed in 1936 the Mortgagors and Lessees Rehabilitation act, which made provision for the adjustment of excessive mortgage indebtedness; and sanctioned resumption and expansion of schemes of public works, which had been seriously curtailed during the previous period of financial stringency. The year 1938 saw passage of the Social Security act,

which consolidated pension measures and initiated extensive health and medical benefits. At the 1938 general election, at which Labour was returned to office, 92.85% of the electorate exercised their votes. The Labour party held 53 seats, the National party 25 and the Independents 2; as a result of by-elections and resignations from the party, immediately prior to the 1943 general election Labour representation had been reduced to 50, with 25 Nationals, 4 Independents and 1 Democratic Labour. Approximately 84.6% of the electorate voted at the general election in 1943, at which Labour seats fell to 45, the National party secured 34 and there was 1 Independent.

World War II.—Savage continued to head the Labour government until his death in March 1940; his successor as prime minister was Peter Fraser who, the following July, formed a special war cabinet. The country, no longer a belligerent automatically when the United Kingdom was at war, elected voluntarily and unanimously to support Britain's declaration of hostilities against Germany in 1939. The year 1940 marked the centenary of the proclamation of British sovereignty in New Zealand. A centennial exhibition was held in Wellington during Nov. 1939–May 1940, historical publications were produced and special stamps and coins issued.

Early in the conflict emergency war legislation was enacted, including the prohibition of strikes, a volunteer force was recruited for overseas service and service for home defense again became compulsory. After Dunkirk the dominion shipped half of its stock of rifle ammunition to Britain, where it was urgently needed, and in 1942, when the onrush of Japanese aggression was still unchecked, New Zealand dispatched half its trained troops, half of its limited bomber force and all of its anti-aircraft guns to defend the outpost of Fiji, key to strategy in the Pacific. The country became a base for U.S. forces.

Further reference to the part played in World War II is made in the section *Defense* below. (W. B. Pn.; X.)

After World War II.—The war placed a great strain on the basis of the welfare state and challenged much of the philosophy of the Labour party, which was still in power. In social security there was an increase of hardship, as well as of planning, for progress had to wait. A policy of stabilization was adopted, in accordance with three principles: (1) prewar control of prices and wages; (2) the maintenance of prices to the consumer of the necessities of life at as low a level as possible, and the distribution of those necessities as widely as possible; and (3) general agreement that economic stability rather than social progress was the best goal during wartime.

During the war this policy was remarkably successful: the cost of living did not increase at any great rate and the framework of social security was preserved. After the war ended, however, with the inevitable shortages of consumer goods, the policy of stabilization weakened and public irritation followed. More scope was urged for private enterprise. By and large, the war had little permanent effect on the economy, the pattern remaining as before with overseas markets and prospects dominant. In the election of 1949 the Labour government was defeated by the National party led by S. G. Holland, who then became prime minister. A campaign was immediately launched to establish more private enterprise; a reduction of subsidies on foodstuffs and a relaxation of controls was greatly hastened. The country remained prosperous since overseas prices for exports of butter, cheese, lamb and wool remained high. There was little unemployment and a vigorous policy of immigration continued to be encouraged.

In the legislative field important acts passed were the Westminster Adoption act of 1947, which ratified the Statute of Westminster passed by the U.K. Parliament in 1931. In 1949 the Military Training act introduced compulsory military training and the Gaming Amendment act instituted government-controlled off-course betting. In 1950 capital punishment, which had been abolished by the Labour government in 1941, was restored, and a major constitutional change was made by the introduction of an act abolishing the legislative council, the upper house of the New Zealand parliament. The peace treaty with Japan was ratified in 1952. An important change was made in the control of the state railways when in 1952 the administration was handed over to a commission; previously the railways were under the control of a government department. Probably the most important legislation in 1952 was the Land Settlement Promotion act which was designed to prevent undue aggregation of land and assist further settlement on farmlands.

In the conduct of external affairs there was little dissension. None questioned the primary loyalty to Great Britain and the commonwealth or the country's strong support of the United Nations and its specialized agencies. Recognition of the predominant power of the U.S. in the Pacific was implicit in the Australia-New Zealand-U.S. pact signed in 1951, but New Zealand spokesmen also insisted that all who fought against the axis and Japan should take part in the negotiation of the peace treaties, and they showed some apprehensiveness at the rearming of Japan. When war broke out in Korea, New Zealand troops were sent to support the U.N. command. New Zealand also enthusiastically supported the Colombo plan.

A notable event was the royal tour which brought Queen Elizabeth II and the duke of Edinburgh to New Zealand from Dec. 23, 1953, to Jan. 30, 1954; this was the first time that a reigning British monarch had visited the country.

POPULATION

In Jan. 1840 New Zealand had a more or less fluctuating population of about 1,000 whalers, sealers, traders, missionaries and settlers. By 1861 the number was slightly less than 100,000. Gold discoveries in the 1860s and a vigorous development policy of public works and assisted immigration in the 1870s multiplied the number of colonists nearly five times, to 489,933 in April 1881. Subsequently the increase slackened because of economic depression, but with the development of the frozen-meat trade and rising world prices in the 1890s the population again increased steadily, and by March 1901 New Zealand's white population numbered 770,000. Natural increase rather than migration proved the principal factor for growth in population during the first 30 years of the 20th century. The rate of increase year by year declined substantially, however, and in the five depression years 1931–35 there was actually a net exodus from New Zealand of 9,918. Excluding Maori, at the census in 1921 the population numbered 1,218,913; in 1926 it was 1,344,469; in 1936, 1,491,484; and in 1945, 1,647,635. A census was taken in New Zealand proper on April 17, 1951, and in the island territories on Sept. 25, 1951. The following are the population totals: New Zealand proper (excluding Maori) 1,823,796, Maori 115,676, total 1,939,472; Cook Islands 15,079; Tokelau 1,571; Niue 4,588; trust territory of Western Samoa 83,096.

At June 30, 1953, the population of New Zealand was estimated at 2,047,405, including 124,089 Maori. The Maori are considered in a separate article (*see* Maori).

More than three-fifths of the population of New Zealand is urban and more than two-thirds of that is found in the North Island. There are four main cities. In the North Island are Auckland, the largest, with a population of 329,123 at the 1951 census; and Wellington, the capital, whose population of 133,414 shows an apparent fall from the figures of earlier years through the separation of Hutt (74,878) as a new urban area.

In the South Island are Christchurch (174,221) and Dunedin (95,457). Other towns (all of city status but with population

figures not confined to the city area) are, in the North Island, Hamilton (33,137), Gisborne (19,774), Napier (24,538), Hastings (23,797), New Plymouth (24,923), Wanganui (29,717), and Palmerston North (32,908); and in the South Island, Nelson (20,497), Timaru (22,851) and Invercargill (31,613). In recent years the greatest increase in population has been that of Auckland, but Hamilton and Hutt have also grown very rapidly. (Population figures given include suburbs.)

The birth rate declined steadily after 1921, reaching a figure of 16.17 per 1,000 of the population in 1935. Thereafter a steady improvement set in, and the rate for 1941 (22.81) was the highest attained after 1922; in 1952 the rate was 24.77 per 1,000. The Maori birth rate was about double that of the white population, the figure for 1952 being 45.41 per 1,000. The favourable climate of the country and the high efficiency of health services contributed toward a comparatively low death rate. In 1933 the death rate reached a new low point of 7.99 per 1,000; thereafter there was an increase, in 1952 the death rate being 9.47 per 1,000 mean population. New Zealand's population is predominantly of British stock. More than 90% of its people are of British Isles ancestry or were born in England, Ireland, Scotland or Wales.

Immigration.—People who are wholly of British birth and parentage and wholly of European race and colour are given verbal permission to enter New Zealand at the time of their arrival, provided they are in good health, of good character and in possession of a valid passport. Such people do not need written permits, visas, guarantees of work or to have any prescribed sum of money. Persons not wholly of British birth and parentage (that is aliens, naturalized British subjects and people both or either of whose parents were not born British subjects) and those not wholly of European race and colour must obtain written permits to enter the country from the immigration division of the department of labour and employment before they leave for New Zealand.

The New Zealand government introduced an assisted passage scheme in 1947 for migrants from the United Kingdom and from that time accepted single men and women under 46 for a wide variety of occupations. The scheme also included family groups nominated by a friend, relative or employer in New Zealand. The nominator in New Zealand had to guarantee accommodation for the family and the working members had to have occupational skill.

Between 1946 and March 31, 1953, 18,491 migrants were granted free passages to New Zealand from the U.K., and 45,994 settlers made their own way there from the U.K.; 30,703 migrated to New Zealand at their own expense from other commonwealth countries. During the same period 23,815 settlers from noncommonwealth countries arrived in New Zealand, of whom about 4,500 were displaced persons from Europe. (A. T. Cl.)

Religion.—Of those answering the "religion" question at the 1945 census 37.53% of Europeans and 32.99% of Maori were Anglicans; and 13.45% of Europeans and 15.38% of Maori were Roman Catholics. Of other Christian denominations the Presbyterian (23.38% of Europeans, 1.67% of Maori in 1945) and Methodist (Europeans 8.12%, Maori 7.63%) are the largest. The Latter-Day Saints (Mormons) have had considerable success among the Maori (*c.* 10% of Maori Christians). There are also a number of specifically Maori Christian sects of which Ratana (17.4% of Maori in 1945) and Ringatu (5.23%) are the strongest. The *Pai-marire* or Hau-Hau, the fanatical anti-Christian sect of the Maori wars, had only 662 adherents in 1945. (*See* also MAORI.)

Christianity was brought to the country in 1814 by an Anglican missionary priest, Samuel Marsden, "the apostle of New Zealand." New Zealand was constituted a mission archbishopric of the Church of England, with see at Auckland, in 1841, but in 1857 became an autonomous metropolitan see. In that year the Church of the Province of New Zealand was inaugurated, in full communion with Canterbury. Government is by a general synod, which elects the archbishop-metropolitan or primate from among the diocesan bishops. Thus the primate's see is not fixed in any one city. There are nine dioceses (including two with jurisdiction over Melanesia and Polynesia) and a separate bishopric (Aotearoa) for the Maori. The Roman Catholic Church is organized in three dioceses subject to the archepiscopal see of Wellington.

Education.—The Education act of 1877 made state education in New Zealand free, secular and compulsory between the ages of 7 and 14. The school-leaving age was subsequently raised to 15. In 1914 the educational system was recast, the dominion department of education assuming many powers hitherto vested in local educational authorities.

Kindergartens.—Children between the ages of three and five may be enrolled at free kindergartens maintained by the New Zealand Free Kindergarten association. The government makes annual grants toward the support of the kindergartens, but the system is far from universal. In 1951 there were only 127 free kindergartens, with 4,906 children on the rolls.

Primary Schools.—Although every child has to be enrolled at the age of seven as a pupil of either a public or registered (private) school, entry to primary school is permissive from the age of five. All state primary schools are coeducational. The syllabus of instruction includes, besides the "three R's," elementary science, agriculture and, in some instances, dairy work. Older boys receive instruction in woodwork and metalwork at manual-training centres, and older girls are taught domestic subjects. In country districts where there are not enough children to warrant separate secondary schools, older pupils attend district high schools, which are under the same control as the primary schools. In addition, there are intermediate schools (formerly termed junior high schools) which provide varied and enriched courses for older children to help them decide on their lines of further education. There were, in 1951, 1,885 public schools within the primary-schools system, these including district high schools and intermediate schools or departments, and the number of pupils enrolled at the end of that year totalled 267,273.

Postprimary Schools.—In 1936 free postprimary education to the end of the year in which he is 19 was offered to every child completing a primary-school course or attaining the age of 14 years. A total of 90% of the children leaving public primary schools continue to full-time postprimary schooling. Postprimary (secondary) schools are termed grammar schools in Auckland, colleges in Wellington and high schools in the North Island and over most of the South Island. Where a secondary and a technical school are amalgamated under a single governing body the resulting institution is known as a combined school. Technical schools fall roughly into two types: those in the small centres distinguishable from secondary schools only by having a rather more strongly developed practical side; and large technical schools in the main centres—where city secondary schools provide an academic curriculum. In 1951 the state conducted 40 secondary schools, 7 combined schools, 110 secondary departments of district high schools and 30 technical high schools. The government assumed in 1938 full responsibility for the work of vocational guidance at postprimary schools.

Rural Education.—It is the policy of the government to provide for country children, as far as practicable, the same educational facilities as those available to town children. For this purpose small rural schools have been consolidated and school buses or free railway passes furnished. Where these do not suffice, a horseback allowance is made. Correspondence classes are conducted for those in very remote areas, and broadcasting is much used. Country teaching positions are relatively better paid, and every city teacher, to qualify for promotion, has to serve for three years at a country school. The curriculum is adapted to the social and economic background of each school. The teaching of agriculture is a special feature in rural schools, and projects are undertaken by boys' and girls' agricultural clubs.

Private Schools.—In 1922 registration of every private school was made compulsory and certain standards of efficiency and suit-

ability of staff, premises, equipment and curriculum required. In 1951 there were 308 private primary schools, of which 242 were conducted by the Roman Catholic Church. That denomination and the Anglican and Presbyterian churches maintain their own secondary schools (there were 74 in 1951), generally boarding establishments. In 1950, 35,922 pupils attended registered private primary schools and 9,341 registered private and endowed secondary schools. Some of the private secondary schools are run on English public-school lines and the headmasters of some of the boys' schools belong to the Headmasters' Conference of Great Britain. Of such schools Christ's college, Christchurch (1850), is the oldest. Others are King's college, Auckland (1896), and Wanganui Collegiate school (1854).

Maori Education.—While more than half the Maori children attend the public schools together with the white children, there are also a few village schools provided for their education, as well as some mission schools remaining from the pre-Maori wars system. The Maori frequently make better progress in their own schools, where they are taught Maori arts and crafts, song, legend and history. In 1951 there were 159 village schools and 10 mission schools, with a total roll number of 13,663 (of whom 1,142 were non-Maori) and 822 respectively; 19,154 attended the public schools. Maori are entitled to free secondary education provided in ten Maori high schools maintained by the government and, for those in remote districts, in private denominational schools by means of government scholarships. In all 863 pupils attended these schools and in 1951 there were nine district high schools offering courses of a practical nature specially suited to the needs of Maori pupils.

Higher Education.—The University of New Zealand (founded 1870 as an examining body; refounded 1926 as a federal university) comprises four university colleges—at Auckland (1882), Wellington (Victoria University college, 1897), Christchurch (Canterbury University college, 1873) and Dunedin (University of Otago, founded 1869 as a degree-granting institution; granting of degrees put in abeyance 1874). Although each provides the customary arts and science courses, Auckland specializes in architecture, commerce and engineering; Wellington in law; Christchurch in engineering and music; and Otago in medicine, dentistry, mining and metallurgical engineering. In practice an integral part of the University of New Zealand are the two "associated" agricultural colleges—Massey (1926), near Palmerston North, and Canterbury (1873), at Lincoln near Christchurch. The government provides liberal scholarships, bursaries and studentships. In 1951 of 11,691 enrolled students at the six colleges, 5,876 received free university education.

Adult Education.—The Workers' Educational association is one of the principal agencies for adult education. Working with the university colleges, it conducts tutorial classes in the cities and carries on work in the country by means of material specially prepared as a basis for discussion among groups of people. The organization receives government and university grants and donations from trade unions, local bodies and private individuals. The National Council of Adult Education co-ordinates the adult educational activities and recommends the amount and allocation of the annual grant for adult education paid by the University of New Zealand.

Educational Research.—With the financial assistance of the Carnegie Corporation of New York, the New Zealand Council for Educational Research was founded in 1933.

CONSTITUTION AND GOVERNMENT

New Zealand was constituted a dominion in 1907. The Statute of Westminster (see *History* above), though not formally adopted till 1947, recognized its autonomy in 1931. In accordance with parliamentary legislation Queen Elizabeth II was proclaimed in Wellington on May 29, 1953, "by the Grace of God, of the United Kingdom, New Zealand and her other Realms and Territories Queen, Head of the Commonwealth, Defender of the Faith." This now declared the British monarch's specific and separate sovereignty over New Zealand, as also over other commonwealth realms. The sovereign is represented by the governor general, whom the former appoints after consultation with the New Zealand government. Representing a constitutional monarch, he must be guided in the execution of his powers and authority by the advice of the New Zealand cabinet; while he does not "govern" and his functions are "state" and formal, his signature affixed to an act of parliament or order in council expresses legislative or executive decision.

Although the Statute of Westminster was not formally adopted until 1947 by the New Zealand parliament, this had not diminished the dominion's freedom to conduct both its internal and external affairs as it saw fit, without the direction of the British government. New Zealand is represented overseas (1954) by high commissions in the United Kingdom, Australia and Canada; by an embassy in the U.S. (the first New Zealand mission to a foreign country, established as a legation in 1942); and by legations in France and Japan. The United Kingdom, Australia, Canada, India and Pakistan have high commissions in New Zealand; the U.S. maintains an embassy; and Belgium, France, Israel, Italy, the Netherlands, the Philippines, Sweden and the U.S.S.R. have legations.

Central Government.—There were in the early years of New Zealand six distinct settlements—Auckland, Wellington, Nelson, New Plymouth, Canterbury and Otago—between which communication was for several years irregular and infrequent. To meet their political needs the Constitution act of 1852 made them into provinces, with elective councils and superintendents subordinated to one colonial legislature. In 1876 the provincial system, which produced confusion because of lack of uniformity, was abolished and full control passed to the legislature, properly called the general assembly but usually known simply as parliament. This body consisted of the legislative council (the upper house) and the house of representatives (the lower house). The number of members of the legislative council was indeterminate and they were appointed for seven years by the crown; *i.e.,* by the governor general on the advice of the cabinet. Women became eligible for appointment in 1941. Provision was made in 1914 for an elected legislative council, but this change was not made. Members were paid and, subject to certain exemptions, could be fined for absence. As in the case of the United Kingdom house of lords, the legislative council could not initiate or amend taxation and revenue bills, and as a general rule most legislation was in fact first introduced in the lower house. In 1951, however, by an act passed in 1950, the legislative council was abolished and a constitutional reform commission was set up to decide on an alternative system.

The house of representatives has 80 members, four of whom are Maori. After each population census the 76 European electorates are readjusted according to population distribution. Until 1945 an addition was made to rural population so that the number of rural electorates, in proportion to their population, was higher than urban electorates. The "country quota," as this allowance was called, first appeared in 1881; it was computed on the basis that 28% is added to the rural population—for electoral purposes, population other than that contained in a city or borough of more

than 2,000 inhabitants or in any area within five miles of the chief post offices at Auckland, Wellington, Christchurch or Dunedin. From 1952 quotas for European electoral districts were obtained from the total population as disclosed by the census. Provision exists for an allowance or subtraction of 7½% of the total population where districts containing the exact quota could not be formed consistently with consideration to topography, community of interest, communications and existing electoral boundaries. In 1937 the normal life of parliament was fixed at three years. Women became eligible as parliamentary candidates in 1919 and public servants in 1936, the latter with the provision that if elected they immediately ceased to be public servants. Members of the legislative council were ineligible, as were individual contractors to the public service where payment of more than £50 was involved. An elector must be a British subject resident for one year in New Zealand and for three months in the electoral district in which he claims to vote.

Registration became compulsory in 1924. Maoris are qualified to vote only at elections of the four members representing their race, a secret ballot being introduced in 1937.

Executive administration is conducted on the principle of the British parliamentary system, that is, executive power is vested in a cabinet (the members of which, with the governor general, also constitute the executive council) responsible to the elected chamber of the legislature—the house of representatives. The cabinet, chosen from members of the majority party in the house, consists of the ministers or "political heads" of departments of the government. It is customary for the Maori race to be represented by one of its members in the cabinet. Members of the house of representatives are paid.

Cabinet portfolios are allocated by the prime minister, the leader of the majority party in the legislature. In the case of the National party, those who shall become members of the cabinet are selected by caucus (*i.e.*, by all the parliamentary National members), the prime minister only assigning those chosen to their respective posts; the prime ministers of other parties are free to decide who shall enter the cabinet.

Local Government.—With the abolition of provincial administration in 1876 (*see* above) the dominion was divided into 63 counties, with provision for elective councils to deal with such primary needs as road making and bridge building. For purposes of local administration of this type the 63 counties were later subdivided into 129 and, in addition, there were 127 borough councils (for areas not greater than 9 sq.mi. having a population of at least 1,000), 21 dependent town districts (where there were 50 householders in an area of not more than 2 sq.mi.) and 34 independent town districts (having a population of 500). Besides the 129 counties, and the boroughs and independent town districts within them regarded as separate administrative entities, there were numerous autonomous, overlapping districts formed from parts of counties (concerned with roads, drainage and rivers) and others made up of groups of adjacent districts of other types united for a common purpose. By 1952 there were altogether 909 local authorities. The compulsory amalgamation of many of these local bodies was sought repeatedly, but entrenched local interests frustrated all attempts at reform.

Judiciary and Police.—The chief justice of New Zealand and a number of puisne judges constitute the supreme court and court of appeal. There are also three special courts—arbitration, compensation and land valuation. Magistrates' courts have both civil and criminal jurisdiction, but more serious criminal cases are not tried summarily but sent forward to the supreme court for trial or sentence. Maoris may use their own language in court.

The police force is a national organization maintained wholly by the central government. It replaced the New Zealand armed constabulary in 1866. (X.)

DEFENSE

Before 1939.—To assist the empire in the South African War of 1899–1902 New Zealand sent ten contingents of mounted rifles numbering 6,495 officers and men. In 1909 compulsory training in peacetime was introduced and in 1916, two years after New Zealand had joined with the rest of the empire in the war against Germany, recourse was had to conscription for service overseas; 98,950 men went overseas in that war, serving in many parts of the world, notably at Gallipoli (where the title Australian and New Zealand army corps was condensed to the famous "Anzac") and in France; 16,697 lost their lives on active service.

Compulsory military training in peacetime was suspended in 1930 and New Zealand faced the beginning of World War II with a small voluntary territorial force together with the New Zealand division of the royal navy (established 1920) and the Royal New Zealand air force (established as a separate service in 1937).

World War II.—The New Zealand government had, for several years before 1939, been very strong in its advocacy of collective action to check aggression and it showed no hesitation in joining the United Kingdom when Germany attacked Poland. In June 1940 both home and overseas service were put on a compulsory basis. After the "total" mobilization that followed Japan's entry into the war, industrial conscription was introduced. The New Zealand 2nd division, as the new expeditionary force was called, suffered severe casualties in 1941 in Greece and in Crete where the defense of the island was entrusted to its commander, Maj. Gen. B. C. (later Lord) Freyberg. Later in the year the division took part in the advance into Libya. In June 1942 it played a decisive part, at Minkar Kuaim, in stemming the axis advance into Egypt. It was one of the assaulting divisions at El Alamein and was prominent in the pursuit of the axis forces until their surrender in Tunisia. In Oct. 1943 the division crossed to Italy where it saw further hard fighting—particularly at Monte Cassino.

The 3rd division, formed for action in the Pacific, took part in relatively minor operations in the Solomons. The New Zealand naval forces (designated the Royal New Zealand navy in 1941) took an active part in hostilities from Dec. 1939 when the New Zealand cruiser "Achilles" took part in the battle of the Río de la Plata against the German pocket battleship "Admiral Graf Spee." Seven squadrons of the Royal New Zealand air force served in Europe with the R.A.F. and 26 with the U.S. forces in the Pacific. In all, 135,000 New Zealanders served overseas—10,130 were killed, 19,345 wounded and 8,086 taken prisoner. Conscription did not apply to the Maori population, 7,000 of whom served voluntarily in a Maori battalion which fought with great distinction as part of the 2nd division.

In 1939 New Zealand had no munitions industry but during the war its factories turned to the manufacture of many of the smaller types of munitions—small arms ammunition, shells, mortars, small vehicles such as carriers, etc. However, apart from its fighting men, its main contribution was in the maintenance of supplies of meat and dairy produce on which the United Kingdom was dependent. Five New Zealand merchant ships were lost through enemy action. To assist the large U.S. forces stationed in New Zealand and elsewhere in the Pacific from 1942 onward, substantial assistance was given by New Zealand under reciprocal aid both in defense construction and the supply of foodstuffs.

A Labour government was in office at the outbreak of war but from July 1940 the war effort was controlled by a war cabinet representing both sides of the house. A short-lived attempt at fuller co-operation between the parties in the form of a war administration failed in 1942, after which the opposition withdrew their support from the two of their members who continued to sit in the war cabinet. There was, however, complete agreement between the parties that the war effort should be prosecuted to the utmost of the country's resources.

Postwar.—Defense activities are supervised by a defense council of ministers and officials. In 1949 all male New Zealanders were made liable for a 14-week period of military training on becoming 18, to be followed by 60 days' service over the next three years. For the following six years they remain members of the reserve with no training liabilities. The introduction of compulsory training made possible the organization and training of a division in peacetime.

In fulfilment of its obligations under the United Nations charter New Zealand sent a voluntarily recruited field regiment of artillery with auxiliary units to join the United Nations forces in Korea. New Zealand frigates also served there from almost immediately after the outbreak of fighting. New Zealand also supplies some officers for the Fiji military forces.

SOCIAL CONDITIONS

Labour Legislation.—As a result of the legislation of the Liberal government which came into power in 1891 New Zealand acquired world fame as a land of advanced social legislation while still in the pioneer stage of economic development. The labour code, established principally by the Industrial Conciliation and Arbitration act of 1894, provided for the settlement of industrial disputes by judicial means and not by strike action and enabled working conditions to be modified to meet changes in the country's economy without constant recourse to acts of parliament. The system of compulsory arbitration was modified to the point of abolition during the depression of the 1930s. It was restored by an amending act of 1936 which also empowered the court to fix basic wage rates for adult workers and, where practicable, to fix the maximum hours of work per week (exclusive of overtime) at 40. Union membership was made compulsory. During World War II strikes and lockouts were illegal. As a result of the serious waterfront strike of 1951 legislation was passed to ensure democratic control of unions. It provided for the election of officials by secret postal ballot and gave the state power to require a secret ballot to be taken at any stage during a strike. After 1944 all workers had a minimum paid holiday period of 14 days annually.

Social Security.—New Zealand's Old-Age Pensions act, 1898, was the first such measure in any British country. Widow's pensions were introduced in 1911; pensions were granted in 1915 to miners incapacitated through pthisis; in 1926 allowances were granted to families where the parents had more than two children and limited incomes; blind persons and chronic invalids also received pensions. The Social Security act of 1938 increased the rates of the various noncontributory civil pensions and placed them on a universal contributory basis. It also introduced a universal superannuation scheme under which benefits were to be paid irrespective of income received or property owned. Provision was also made for new health and medical benefits (*see* below). In 1945 family benefits were made payable for each child, irrespective of size of income or number of family. In 1948 many New Zealand social security benefits were put on a reciprocal basis with those in the United Kingdom and Australia. New Zealanders pay 1*s*. 6*d*. in each £1 of income to the Social Security fund which is also supplemented from general revenue.

Hospitals and Health.—Before 1938 the expenses of hospital boards were met by payments from local ratepayers, government subsidies and contributions from those patients who were able to pay. By the Social Security act the responsibility for the patient's share was transferred to the Social Security fund. The contribution of local ratepayers was being reduced in the mid-1950s and it was intended that by 1958 the entire cost should be borne by the state.

Under the social security scheme 7*s*. 6*d*. is paid from the fund toward the cost of a visit to or by a doctor. Medicines prescribed by a doctor are free. Maternity benefits include antenatal and postnatal advice and treatment, services of doctors and nurses at confinements and treatment and maintenance in hospital. In the case of private hospitals part of the fee for treatment and maintenance is covered by payments from the Social Security fund.

Housing.—Through the state advances department, created in 1894, the government lent money for the purchase of homes and the improvement of farms. In 1934–35 the department was reconstituted as the Mortgage corporation, a limited amount of private share capital being subscribed, but by another change in 1936 the State Advances corporation came into being, with the elimination of private share capital and the liberalizing of provisions governing advances. The government undertook direct home building in 1937. While actual erection was by private builders the purchase of land and the designing and letting of houses were carried out by the state. From 1950 tenants were given the opportunity of purchasing these state houses. The housing shortage became acute during World War II and continued into the 1950s. Rents were controlled from 1936.

ECONOMY

Agriculture.—The total area of New Zealand, excluding the Cook and other Pacific islands annexed in 1901, but including the Kermadec Islands and the outlying islands within New Zealand proper, is 66,390,677 ac. Of this total 43,253,908 ac. were returned in 1950 as being in occupation, including reserves and native lands leased, but excluding areas within borough boundaries, holdings of less than 1 ac. in extent and native land held on the communal system; the total area grassed or cultivated was 20,228,434 ac. and 23,025,474 ac. were unimproved land.

The principal items cultivated are wheat, oats, grass seeds, potatoes, onions, tobacco and orchard produce and the produce of market gardens (truck farms), nurseries and hop gardens. Wheat is the most important grain crop grown in New Zealand—three-quarters of it in the Canterbury district and most of the remainder in north Otago. As not enough is grown for home consumption, large amounts have been imported for several years. The local growers' wheat prices are fixed yearly on a cost-of-production basis.

Grass is by far the most important crop to the farmer, and in many parts of the country tussock and other naturally established grasses have given way, after hard labour, to artificially sown pasture grasses. Aerial top-dressing was an important development. Large tracts of land in the Nelson district, formerly regarded as practically useless, were proved eminently suitable for growing fruit, particularly apples. Nearly one-third of the apple and pear crops are exported. The local market absorbs practically all the stone fruits (mostly cultivated in central Otago) and citrus fruits (produced in Auckland and Hawke's Bay). In 1950 the area under field crops was 1,165,405 ac.; under artificially grown pasture grasses, 17,946,229 ac.; under fruit trees 20,094 ac.; and in plantations, 907,741 ac.

Pastoral Production.—New Zealand is primarily a grazing country; it became the world's largest exporter of mutton, lamb, butter and cheese. Almost all kinds of sheep find a favourable habitat in the dominion; as of June 30, 1952, the total number of sheep was 35,384,000, the average size of the flocks being 1,008. Although ranking fifth among the principal sheep countries of the world, in 1952 New Zealand was fourth largest as a producer of wool and second as an exporter.

In 1952 the total number of cattle in the dominion was 5,450,000. Beef breeds increased after chilled shipments to overseas markets were proved to be satisfactory in 1933. Dairy cows in milk accounted for 36% of total cattle in 1952.

Dairy Produce.—Scientific management increased the season's yield of butterfat per cow from 152 lb. in 1920 to 260 lb. in 1951–52. There were 348 co-operative dairy factories in 1950, some exclusively concerned with turning out butter, a larger number cheese and a few producing dried milk powders and casein; in 1942 butter and cheese amounted to 2,345,000 cwt. and 2,688,000 cwt. respectively and in 1952 the figures were 3,670,000 cwt. and 1,825,000 cwt. The Primary Products Marketing commission, set up

MOUNTAIN AND LAKE SCENES OF NEW ZEALAND

1. Milford Sound, one of the most magnificent fjords on the coast of South Island. In the background is Pembroke Peak and the Lion, so called because it resembles a lion couchant
2. Lake Waikaremoana and Panekeri Bluff, in the southeastern portion of the Auckland district. This is the scene of an extensive hydro-electric development
3. Mount Egmont, visible from nearly every part of Taranaki, is an extinct volcanic cone, on the western side of North Island
4. Lake Wakatipu, bordered on one side by the majestic Remarkables mountains, lies between Kingston and Queenstown, South Island
5. Arthur Valley and Diamond Gully lie at the head of Milford Sound on the west coast of Otago, on South Island
6. View of the agricultural country near Arrowtown, in the Wakatipu district, South Island

BY COURTESY OF THE NEW ZEALAND LEGATION, WASHINGTON, D C.

CITIES AND HARBOURS OF NEW ZEALAND

1. Wellington, capital of New Zealand, lies on the south end of North Island, on Port Nicholson
2. Queenstown, picturesquely located midway up Lake Wakatipu, is a favourite resort town in South Island
3. St. Kilda, a suburb just outside Dunedin, South Island, has a fine sandy beach on the ocean where there is good surf bathing
4. Picton, at the head of Queen Charlotte sound (Marlborough district, South Island), is 50 miles from Wellington, across Cook strait
5. Parliament buildings in Wellington, the seat of government and political centre of the dominion
6. Napier, capital of the Hawke's Bay district, showing the Cenotaph erected to the memory of soldiers of World War I. Napier has been rebuilt since it was destroyed in the earthquake of 1931
7. General view of Dunedin, capital of the Otago district, South Island
8. Christchurch, capital of the Canterbury district, South Island, showing Cathedral square in the heart of the city, which is on the plains 5 miles from the sea
9. Auckland, the largest city in New Zealand, on a beautiful deep-water harbour, North Island

in 1947, acquired ownership of butter and cheese, at f.o.b. rate or in store, marketing or disposing of it in the United Kingdom or regulating its distribution on the local market. The New Zealand Dairy board was concerned with the internal aspect of the dairy industry and herd testing.

Forestry.—State forests aggregated 9,481,000 ac. in 1951 and comprised 56% of the total forest area and 15% of the total area of New Zealand proper. The total forest area included 1,250,440 ac. of exotic forests, of which 796,440 ac. were administered by the New Zealand forest service (including 450,000 ac. planted) and 436,000 ac. were communal or belonged to afforestation companies.

To preserve young growth and encourage natural regeneration, logging is done in state forests by the government forest service. Fire hazard prediction instruments, radio and aircraft are used in forest fire prevention, while denudation of forests and soil erosion has also been checked. A development of the 1950s was two large pulp, paper and lumber projects—at Murupara and Tokoroa—based on nearly 500,000 ac. of exotic forest.

Fisheries.—The most important of the edible fishes are the snapper, the terakihi, flounders of various species, blue cod and the groper or hapuku. Except for groper and ling fishing by means of long lines, most fishing is carried on at depths of less than 40 fathoms. Fishery products marketed in 1951 were valued at £1,390,415. The principal oyster beds were those in Foveaux strait. With the enormous development of pelagic whaling, New Zealand's formerly important whaling industry greatly declined, and after 1940 the only shore station in commercial operation was that in Tory channel, Queen Charlotte sound. The taking of seals was prohibited. Swordfish (the common big-game fish), striped black marlin and broadbill (a rare visitor), mako shark and other big-game fish are found off the east coast of Auckland province.

Minerals and Mining.—Coal was mined in the 1930s to a greater value than gold, the mining of which had been New Zealand's chief industry in the 19th century. In 1951, 2,435,505 tons of coal, valued at almost £2 10*s.* a ton, were produced. Gold production declined considerably, and in 1951 only 75,115 oz. were produced, valued at £915,356. Production of kauri gum, the fossilized resin of former kauri forests, was considerable until its displacement by synthetic lacquers and resins. Silver is found alloyed with gold in the Hauraki region, and other minerals of commercial importance include tungsten ore, pumice, manganese ore, iron ore and silica sand and scheelite. Copper, mercury, tin, platinum, sulphur, asbestos, bentonite and phosphatic rock also occur. Petroleum of good quality but in limited quantity has been proved.

Factory Production.—While the farming industries were of major economic importance, the government made every effort to encourage establishment of local manufactures. During the early days of colonization bounties were offered in many instances to aid the introduction of new industries and to induce experienced factory workers to immigrate, and subsequently, in the development of New Zealand's tariff policy, locally manufactured products were afforded a measure of protection. Nevertheless, industrial expansion was necessarily limited by the size of the available market and by the competition of products of large-scale enterprises established in the more densely populated countries.

In 1930–31 there were 5,194 factories in operation in the dominion, the value of their output being £77,645,249. As a concomitant of the world-wide depression in trade and industry, factory production declined during the next two years, but a period of recovery then set in, reaching in 1941–42 a record high level with 6,367 manufacturing establishments having an output valued at £155,566,195.

World War II and shortages following it further stimulated industrial development and in 1950–51 the number of factories had increased to 8,318 with an output valued at £395,045,818. The principal industries are meat freezing and preserving, butter, cheese, condensed and dried milk manufacture, fellmongering and scouring, sawmilling and the manufacture of forestry products. Others of major importance include hydroelectric power production, woollen and clothing manufacture and fertilizer production.

Water Power.—New Zealand is topographically well suited to hydroelectric development, about 5,500 Mw. being available in the South Island and 1,250 Mw. in the North Island. In 1903 sole right to use the water power of the dominion, subject to any existing rights, was vested in the crown. This right might be delegated to local authorities and private concerns, and these were required, by regulations amended in 1934, to obtain permission to generate power from the minister of public works and to pay an annual rental. Hydroelectric power is put to a variety of uses on the farms and in industry, while many of the railway lines have been electrified. The government generating stations are: in the North Island, Maraetai (which began operations in 1953 with a capacity of 18,000 kw.), Karapiro (started 1947; 90,000 kw.), Arapuni (installed capacity, 1946, 157,800 kw.), Tuai (52,000 kw.), Piripaua (40,000 kw.), Kaitawa (32,000 kw.)—these three constituting the Waikaremoana scheme—and Mangahao (19,200 kw.); and in the South Island, Waitaki (105,000 kw.), Lake Coleridge (34,500 kw.), Highbank (25,200 kw.), Lake Tekapo (25,200 kw.), Lake Monowai (6,000 kw.), Cobb River (32,000 kw.) and Arnold (3,060 kw.). In 1943 the government adopted a ten-year plan for increasing the hydroelectric supply on the North Island. By 1953 three stations of ten planned—Arapuni, Karapiro, Maraetai—had been built on the Waikato river; long-distance power lines were to carry 220,000 v. instead of the existing 110,000 v. In 1953 about 93% of the population had access to electric supply, the cost of which to the consumers (83% of them domestic) was rather less than one penny per unit (kilowatt-hour). During 1953 a project for a 20,000 kw. geothermal steam station at Wairakei near Taupo in the central North Island was being studied: geothermal potential was estimated at 200 to 400 Mw.

EXTERNAL TRADE

The total trade of New Zealand per head of population is one of the highest in the world. In 1952 the figure for exports and imports combined was just slightly more than £250 per head. This high volume of trade means that the New Zealand economy is very dependent on prices and conditions in world markets, especially in the United Kingdom and the United States, which are its largest customers.

Total merchandise trade (excluding specie) for the years 1949–52 is shown in Table II.

Table II.—*Merchandise Trade of New Zealand*

Calendar year	Exports £000	Imports £000	Total trade £000	Excess of exports £000
1949	147,290	119,713	267,003	27,577
1950	183,752	157,943	341,695	25,809
1951	248,127	206,534	454,661	41,594
1952	240,813	252,439	493,252	−11,626

Total overseas receipts and payments made by the New Zealand banking system during the same period are shown in Table III.

Table III.—*Overseas Receipts and Payments*

Item	1949 £000	1950 £000	1951 £000	1952 £000
Receipts for:				
Exports	139,203	194,786	254,135	215,909

Balance	−6,489	+14,455	+16,058	−23,441

Exports.—In 1952 dairy products (butter, cheese, casein, dried and condensed milk), meat and wool accounted for 88% of total exports. Other exports are timber, sheep and cattle skins, apples, seeds and peas and canned vegetables. The quantity and value of the major exports from 1949 to 1952 are shown in Table IV. (The figures for 1951 and 1952 are affected by the long dock strike of 1951.)

TABLE IV.—*Quantity and Value of Major Exports*

Calendar year	Butter		Cheese		Frozen and chilled meat		Wool		Sheepskins and pelts	
	000 cwt.	Value £000	000 cwt.	Value £000	000 cwt.	Value £000	000 lb.	Value £000	Number 000	Value £000
1949	2,952	35,450	1,879	12,674	6,882	27,230	429,657	46,553	17,416	3,856
1950	2,750	35,567	1,998	14,536	6,761	28,629	393,974	74,653	17,461	6,736

1952	3,670	55,929	1,825	15,769	7,710	40,475	438,107	81,998	20,092	6,417

After World War II, New Zealand became the world's greatest exporter of meat and dairy produce. In 1952, out of a total world trade in meat of 1,129,000 tons, New Zealand exported 32%, as compared with Denmark, 19%, and the Argentine, 13%; out of a world total for butter of 8,274,000 cwt., New Zealand's share was 44% (Denmark, 28%); and of cheese of 6,442,000 cwt., 29% (Netherlands, 23%). New Zealand was also the second largest exporter of wool, Australia in 1951 exporting 51% of a total of 1,796,000,000 lb. and New Zealand 17%. The United Kingdom takes about two-thirds of New Zealand's total exports, the United States being the next best customer with 11.7% of the total in 1951 and 11.4% in 1952. New Zealand supplied 57% of the butter imported by the United Kingdom in 1952, 63% of the cheese and 58% of the carcass meat. The importance of the trade link between the two countries can be further gauged by the fact that New Zealand's exports amounted to 54% of the total butter consumed in the U.K. in 1952, 44% of the cheese consumed and 21% of the carcass meat.

Since 1938 exports from New Zealand have been subject, as an exchange control measure, to licensing. The object of the export licensing system is not to restrict exports in any way but to ensure that the full value of the exports in terms of foreign currency becomes available to the banking system.

Imports.—More than 80% of New Zealand's total imports normally consist of articles wholly or mainly manufactured, a large proportion of them being goods (as, for instance, vehicles and tractors) which could not be produced economically in the country. In addition, many imports of manufactured or semimanufactured goods form the raw material of further factory processes in the country; *e.g.*, cotton piece goods. The principal groups of commodities imported are textile piece goods and drapery, metals and machinery, sugar, tea, alcoholic liquors, tobacco, paper and stationery, oils, motor vehicles and accessories, chemicals and drugs and manures. In 1952, 55% of New Zealand's imports came from the United Kingdom (60% in 1950, 43% in 1947). The increase between 1948 and 1950 can be attributed to the need to restrict expenditure in nonsterling areas and to the increased availability of British goods for export.

Over the years 1950–52 the proportion of imports coming from nonsterling sources increased as import licensing, with its preference for goods of United Kingdom origin, was relaxed. The proportion coming from the dollar area increased from 10% in 1950 to 13% in 1952 and from nonsterling Organization for European Economic Cooperation (O.E.E.C.) countries from 4.5% to 9.6%. This increase was mainly at the expense of the U.K. and Australia, the latter's proportion having fallen from 12% to 10.6%. Despite the strict control of imports from the dollar area, the United States with 9.3% and Canada with 3.5% were New Zealand's main suppliers after the U.K. and Australia. These four countries normally supply about 80% of New Zealand's imports. Table V shows overseas receipts and payments for 1952 by currency areas and countries.

TABLE V.—*Overseas Receipts and Payments, 1952*

Area	Trade transactions			Balance on all transactions £000
	Export receipts £000	Import payments £000	Balance £000

*Includes export transactions not assigned to currency areas.

In order to meet a serious decline in overseas funds, strict control of imports by a licensing system was introduced in 1938. This system was continued throughout World War II and early postwar years. After 1950, however, a wide range of goods was freed from licensing control when obtained from soft-currency areas. By 1952 about two-thirds of New Zealand's imports were not subject to licensing and many licences were retained solely to protect local industries. Imports from hard-currency areas were still strictly controlled in 1954, largely to assist in strengthening the sterling area reserves. However, in 1952 a large influx of imports and a fall in wool, hide and skin prices again caused a heavy drain on overseas funds and the Reserve bank, after consultation with the government, introduced in April 1952 a scheme for allocating exchange among importers. Importers are allowed a certain proportion of their 1950 remittances as a basic allocation (the proportion was 80% for 1952, 40% for 1953 and 75% for 1954). The importer can obtain this basic allocation from his trading bank and use it to buy any imports he wishes; any further foreign exchange he requires must be the subject of an application to the Reserve bank. Decisions are made on any application after consultation with government departments concerned, taking into account the essentiality of the goods, their supply position in New Zealand, import licences held by the importer and any other special circumstances. At the same time, import licences from hard-currency areas were reviewed, and motor vehicles were again placed under import licensing control. The granting of an import licence does not carry an automatic allocation of exchange, except in the case of motor vehicles. The scheme was considerably relaxed for 1954, 15 basic commodity groups (including cement, newsprint, tea, phosphate and basic slag) being released from the need for allocation. (D. L. Ws.)

Customs Duties.—New Zealand was party to the General Agreement on Tariffs and Trade (G.A.T.T.), initiated in Geneva, Switz., in 1947, and negotiated many agreements at the tariff conferences. In most cases, however, the imperial preference margin was not altered, and many of the negotiations aimed rather at binding existing rates of duty than at conceding any decrease other than the admission to most-favoured nation rates granted to all G.A.T.T. members.

TRANSPORT AND COMMUNICATIONS

Railways.—The railway system is state owned although there are a few minor private lines mainly serving colliery and saw-milling areas. In 1953 there were 3,535 mi. of state railways open for traffic. The gauge is 3 ft. 6 in. Many mountain chains and rivers make railway construction both difficult and expensive. By 1953 the capital cost had amounted to £93,329,718; *i.e.*, the cost per mile of open line was £26,402. Net earnings were only £83,272. In 1953 the government set up a commission to administer the system with the object of putting it on an economic basis. In 1952–53 more than 10,000,000 tons of goods were carried by rail.

Roads.—On March 31, 1950, there were 53,816 mi. of formed road in the country, 5,604 mi. of bridle track and 17,525 mi. of unformed legal roads, a total for all roads of 76,945 mi. The configuration of the country and the abundance of rivers made road

construction as difficult as the building of railways. Bridges of 25 ft. or more in the roads system in 1951 numbered 8,171. Of the 12,743 mi. of main highways, 5,224 mi. (the principal traffic routes) were classified as state highways and maintained at state expense. The cost of other main highways is shared between the state and local bodies and, with some exceptions, the cost of other roads is borne by local bodies.

Civil Aviation.—In 1945 complete control of air transport was given to the state-owned New Zealand National Airways corporation which took over the existing commercial operators. In 1948 provision was made for other concerns to operate new services and in 1951 the Air Services Licensing act provided for an authority to determine applications for licenses. The National Airways corporation remained by far the largest operator and of the 79,504,000 passenger-miles flown in the year ended March 1953, 79,499,000 passenger-miles were flown by its services. Private concerns were, however, beginning to be active in the mid-1950s in the transport of freight by air, a service which received a powerful impetus from its use during the longshoremen's strike of 1951. The most important international air service so far as New Zealand is concerned is that of Tasman Empire Airways, Ltd., a company formed to operate a service from Australia to New Zealand on capital subscribed by the United Kingdom, Australian, and New Zealand governments. It began operations in 1940 and now operates services from New Zealand to the Pacific islands as well as to Australia. Other services operating to New Zealand are Pan American World Airways (Auckland to San Francisco), British Commonwealth Pacific Airlines and Canadian Pacific Airlines (both Auckland to Vancouver). (A. T. Cl.)

FINANCE

The money composing the public debt of New Zealand was borrowed on the security of the country's public revenues, no part of the public estate being pledged for payment of either principal or interest. At March 31, 1953, the gross public debt stood at £667,600,000 (excluding £26,200,000 of funded debt owing to the British government, on which payments were suspended in 1931 as part of an international moratorium on inter-Allied debts incurred during World War I). Of this total £77,800,000 was domiciled in London. After 1933, when the nominal amount of the external debt was £138,100,000, new public borrowings overseas, other than for conversion and war purposes, ceased and a policy of repaying external debt was put into effect. Almost all the decrease occurred after 1945. In addition, £60,800,000 borrowed from the British government during World War II was repaid by 1946. With the exception of that portion incurred for war purposes (about £240,000,000), the greater amount of the borrowings was for productive and developmental purposes and resulted in revenue-producing assets such as railways, hydroelectric installations, telephones and houses. At March 31, 1953, £399,000,000 (60% of the total debt) was held by government departments and quasi-governmental organizations.

The ordinary revenue and expenditure of the government are shown in the consolidated fund. There are a number of other specialized accounts covering such activities as capital items, social security, commercial and other undertakings, etc. Successive changes in system have largely destroyed the comparability of the figures over any length of time.

Table VI.—*Consolidated Fund Transactions*

Year ended March 31	1950 £000	1951 £000	1952 £000	1953 £000
Receipts				
Income tax	48,483	59,442	78,102	78,701
Other taxation	55,370	62,739	78,835	75,561
Interest	5,886	6,566	7,338	6,893
Other receipts	15,257	15,010	16,514	16,666
Total receipts	124,997	143,757	180,788	177,822
Payments				
Debt charges	22,485	26,314	23,776	24,159
Defense	9,822	15,251	24,640	26,481
Education	11,614	13,346	15,904	18,124
Subsidies	14,856	9,372	15,320	14,720
Transfer to Social Security fund	12,000	14,000	14,000	14,000
Other expenditure	49,913	57,222	74,513	77,031
Total payments	120,689	135,504	168,153	174,515
Surplus	4,308	8,253	12,635	3,307

Most of the receipts of the consolidated fund come from taxation of various kinds but further small amounts are obtained from interest on public moneys, profits of state trading enterprises (such as post office, electricity supply and national airways) and from income earned by government departments for services rendered to the public. Payments from the fund are grouped under permanent or annual appropriations. The latter heading covers payments under departmental votes and the former covers interest on and amortization of the public debt and payments under numerous special acts. Details of the transactions of the fund for the years 1950–53 are shown in Table VI.

The Social Security fund derives most of its receipts from a uniform charge of 1*s.* 6*d.* in the pound on nearly all forms of income, including salaries, wages and the income of companies; the balance is mainly in the form of a transfer from the consolidated fund. Transactions from 1950 to 1953 are shown in Table VII.

Table VII.—*Social Security Fund Transactions*

Year ended March 31	1950 £000	1951 £000	1952 £000	1953 £000
Receipts				
Social security charge	31,703	35,766	43,613	45,508
Other	12,071	14,116	14,169	14,120
Total	43,773	49,882	57,782	59,628
Payments				
Medical and hospital benefits	8,461	8,723	9,368	10,4[illegible]9
Family allowances	14,851	15,289	16,110	16,854
Age and other monetary benefits	21,845	24,133	27,248	29,328
Other	1,203	1,274	1,453	2,216
Total	46,360	49,421	54,180	58,826

For the year ended March 31, 1953, taxation receipts per head of mean population amounted to £99 8*s.* 3*d.*, slightly less than the record figure of £102 7*s.* 9*d.* in 1951–52 but more than four times the figure of £23 9*s.* 2*d.* for 1938–39, the last financial year before World War II. Direct taxes on income (income tax and social security charge) amounted to £124,209,000 in 1952–53 and represented £61 16*s.* 3*d.* a head and 62.3% of total taxation. In 1938–39 the corresponding figure was £14,296,000, representing £8 17*s.* 5*d.* a head and 37.8% of total taxation. Other major taxes are customs and excise duties, sales taxes and death duties. The total tax revenue for 1952–53 was £199,771,000, which represented 30.9% of the national income. In the previous year the figure was £200,550,000 (32.5% of national income) and in 1938–39, £37,797,000 (19.5%). When assessing the high level of taxation in New Zealand, it is necessary to bear in mind the considerable proportion of government revenue which is returned to the taxpayers as monetary payments (without means test); *e.g.*, medical, hospital and family benefits.

In 1952–53 government capital expenditure amounted to £54,600,000, compared with £40,700,000 and £40,200,000 in the two previous years. The main sources of capital funds are loans, national savings and savings banks accounts, depreciation and renewal reserves and miscellaneous capital receipts. Among the major items of expenditure during 1952–53 were hydroelectric development (£12,700,000), housing (£9,800,000), railways (£7,600,000) and land conservation and development (£4,600,000). After World War II government expenditure on its various works programs, although greatly increased in amount, represented a smaller percentage of total capital expenditure than in prewar years. The proportion was 33% in 1952–53 as compared with an average of 42% in the years 1938–40.

Banking.—The banking institutions of New Zealand are the Reserve Bank of New Zealand, five trading banks, the Post Office Savings bank and five trustee savings banks. The Reserve bank, which began operations as the central bank of the country on Aug. 1, 1934, is now state owned, the original private shareholders having been bought out by the government in 1936. As the central bank, it is authorized to control credit, currency, the transfer of money to and from New Zealand and the disposal of export receipts for the time being held overseas. It also has the duty of maintaining a high and stable level of activity in New Zealand insofar as this can be effected by monetary means. Between 1939 and 1950 the minister of finance was empowered to issue directives to the bank on any aspects of central banking practice or policy. In 1950 the law was amended and the bank

must now give effect to any resolutions of parliament in respect of any of its functions or business. It remained a general function of the bank to give effect to the monetary policy of the government. The right of note issue was transferred from the trading banks to the Reserve bank on its establishment and it issued notes in denominations of 10*s*., £1, £5 and £10 and a few £50. Total notes in circulation amounted to £62,500,000 at the end of March 1953. The bank also issues and regulates the supply of coin and since 1936 has managed the public debt.

Two of the trading banks, the Bank of New Zealand and the National Bank of New Zealand, are incorporated by acts of the New Zealand parliament. All the share capital in the former, which had been partly state owned, was acquired by the government in 1945. It conducts more than 40% of banking business.

The other three banks are predominantly Australian institutions. All five banks maintain a large number of branches and agencies throughout the country. At the end of March 1953 demand deposits with the five banks amounted to £200,271,000, time deposits (on which interest ranging from ¾% to 2%, depending on the period of deposit, is paid) to £35,951,000 and advances and discounts to customers to £140,449,000.

In 1953 the number of open accounts in the Post Office Savings bank was 1,486,000, or 7 to every 10 of the population, and the total deposits amounted to £191,274,000, as compared with £84,700,000 credited to 1,087,000 accounts in 1943. Interest at the rate of 2½% is paid on deposits up to £500, 2% from £500 to £2,000 and 1½% from £2,000 to £5,000. The five trustee savings banks had at March 31, 1953, 371,000 depositors with an amount of £38,854,000 standing to their credit. In addition, all the savings banks carry national savings accounts which cannot be withdrawn, except in certain circumstances, for two to three years. They carry interest at 3% and were originally opened in 1940 to help meet war expenditure. At March 31, 1953, these deposits amounted to £62,930,000.

Coins and Currency.—Gold, silver and bronze coins of Great Britain and Australian gold coins were legal tender in New Zealand until 1935 with Australian silver and bronze in free, though not legal, circulation. Distinctive New Zealand silver coins were introduced in 1933 and bronze coins in 1939, the denominations and standards of fineness being the same as in the U.K. After 1947 cupronickel coins were issued in place of silver.

Following the assumption by the Reserve bank in 1934 of the sole right to issue notes, the trading bank notes were withdrawn from circulation and in 1936 the Reserve bank assumed liability for trading bank notes not yet presented. Until 1950 the Reserve bank was required to maintain a minimum reserve of 25% of the aggregate amount of the notes and other demand liabilities. This obligation was abolished in 1950 and the bank is now required to hold such reserves as, in the opinion of the board of directors, will provide a reasonable margin for contingencies. "Reserve" is defined as including gold coin and bullion, sterling exchange (deposits at the Bank of England, British treasury bills and bills of exchange), net gold exchange and net holdings of currencies freely convertible into sterling. From 1933 to 1948 exchange rates were based on a selling rate of £N.Z.125 = £100 sterling, but from Aug. 1948 the New Zealand pound was at parity with sterling.

In 1938, to meet a serious fall in overseas reserves, control over foreign exchange was introduced in conjunction with export and import licensing regulations. The exchange control system was extended in 1940 as a war measure and continued, with modifications. The system is administered by the Reserve bank with the trading banks acting as its agents. Broadly, the situation in 1953 was as follows: the foreign currency receipts on account of exports must be paid to a bank; payments for imports are made under an allocation scheme (*see* above); other payments within the sterling area are not restricted with the major exceptions of capital exports by New Zealand residents and travel allowances; remittances to countries outside the sterling area are treated on their merits; interest, dividends and profits may be remitted to any country but capital movements are strictly controlled; the export of money is subject to permission but the importation of money is not limited except in the case of silver coins and United Kingdom bank notes; dealings in nonsterling securities held by residents are subject to Reserve bank approval and the bank is empowered to acquire such securities if necessary.

In pursuance of its function of controlling credit in New Zealand, the Reserve bank introduced in 1942, with the co-operation of the trading banks and as a government policy measure, a selective control over bank advances aimed at preventing the expansion of credit for speculation and other purposes inconsistent with the war effort. This control was continued after the war to avoid the creation of new money for nonessential purposes or for the financing of capital expenditure when funds were available from other sources. The policy was subsequently modified to meet changing conditions and in 1952 was supplemented by raising the cash balances which the trading banks are required to hold at the Reserve bank. Each bank had to maintain a balance of not less than 7% of its demand liabilities and 3% of its time liabilities. In Aug. 1952 these ratios were raised to 10% and 5% respectively and in May 1953 to 20% and 10%. (D. L. Ws.)

NEW ZEALAND SPINACH: *see* SPINACH.

NEXT FRIEND, in law, the phrase used for a person who represents in an action another person who is under the disability of infancy to maintain a suit on his own behalf. Every application to the court on behalf of an infant must be made through a next friend. Previous to the Married Women's Property act, 1882, it was also usual for a married woman to sue by a next friend, but that act, allowing a married woman to sue in all respects as a *feme sole,* has rendered a next friend unnecessary in her case. In the case of an infant the father is prima facie the proper person to act as next friend; in the father's absence the testamentary guardian, if any; but any person not under disability may act as next friend so long as he has no interest in the action adverse to that of the infant. A married woman cannot, however, act as next friend, except in special cases. (*See* Rules of the Supreme Court, O. xvi, r. 16.) An infant defends a suit, not by a next friend, but by a guardian *ad litem.* A lunatic sues by his committee, but if he has no committee, or if the committee has some interest adverse to the lunatic, he sues by his next friend. A next friend has full power over the proceedings in the action as if he were an ordinary plaintiff, and he is therefore responsible for paying the costs, but he is not entitled to be heard in person. (*See* INSANITY IN LAW.)

NEXT-OF-KIN: *see* KIN.

NEY, MICHEL (1769–1815), duke of Elchingen, prince of the Moskowa, marshal of France, was born at Saarlouis on Jan. 10, 1769. His father was a cooper, and he received only a rudimentary education. In 1788 he went to Metz and enlisted in a regiment of hussars; in 1792 he was elected lieutenant; and in 1794 he became captain and was placed by Kléber at the head of a special corps of light troops. He was soon promoted *chef de brigade,* and in 1796 general of brigade. He commanded the right wing of Hoche's army up to the peace of Campo Formio. On the resumption of hostilities he again took the field, and for his surprise of Mannheim in 1799 received the grade of general of division. He fought in the Swiss campaign of Masséna, and when Masséna turned against the Russians, who were approaching from Italy, Ney was left in command holding his ground successfully against the Austrians, although his opponent was the famous Archduke Charles. In 1800 he was present at Hohenlinden. In May 1802 he married Mademoiselle Auguié, whom Josephine had chosen for him at Bonaparte's request. This event marks a change in Ney's political opinions, which can only be explained by Napoleon's power of captivating men. He was henceforward as ardent and sincere an admirer of Napoleon as hitherto he had been of revolutionary principles, and was one of the very few officers of the army of the Rhine who became a trusted lieutenant of the emperor. He carried out an important mission in Switzerland, and in 1803 he was placed in command of the camp of Montreuil. While there he begged Napoleon to declare himself emperor, and on the establishment of the empire he was made marshal of France, and received the grand eagle of the Legion of Honour. In 1805 he commanded the 6th corps of the Grand army, and his great victory at Elchingen (for which in 1808 he was made duke of Elchingen) practically secured the surrender of the Aus-

trians at Ulm. He was then ordered to the upper Adige, when he led the decisive attack at Friedland. After Friedland Napoleon gave him the title, "the bravest of the brave."

In 1808, after the first disaster to the French arms in Spain, Ney accompanied Napoleon there as commander of the VI. corps. He took part in the Peninsular War from 1808 to 1811. When acting under Masséna in the invasion of Portugal in 1810–11, he quarrelled bitterly with his former chief, and in spite of his distinguished service he was recalled to France by Napoleon and censured. He was re-employed with the *Grande Armée* in central Europe under Napoleon himself. In the 1812 expedition to Russia Ney commanded the centre at Borodino, and was created prince of the Moskowa on the evening of the victory. In the retreat he was a tower of strength, animating the rearguard with his own sublime courage, keeping the harassed and famished soldiers together under the colours and personally standing in the ranks with musket and bayonet. He was the last to recross the frontier, and threw the remaining muskets into the Niemen. In 1813 he commanded a corps in the German campaign, and in 1814 he shared in the campaign in France. At the fall of the Empire the fact that Ney acted in the negotiations in concert with Macdonald and Caulaincourt is sufficient proof of his desire to avert Napoleon's abdication. Less satisfactory was his loud protestation of devotion to the Bourbons, when the Restoration was a *fait accompli.* But he was mortified by the disdain of the returned *émigrés,* and retired to his country seat. While on his way to take up a command at Besançon, he heard of Napoleon's return. He hurried at once to assure Louis XVIII. of his fidelity. With the famous remark that the usurper ought to be brought to Paris in an iron cage, he proceeded to Lons-le-Saulnier to bar Napoleon's progress. But he deserted with his troops, and Napoleon's march became a triumphal progress. Ney's act was undeniably treason to his sovereign, but it was hardly the calculated treason that his *émigré* detractors saw fit to imagine. Napoleon received him kindly, but did not give him a command until just before the Waterloo campaign. The marshal took command of the left wing on the northern frontier on June 13. The next day the army moved into Belgium. Ney took part in the campaign successively in the roles of strategist, tactician and soldier. (*See* WATERLOO CAMPAIGN, 1815.) Much controversy has raged over his actions of June 15 and 16. At Waterloo he was subordinated to the personal command of Napoleon, but his advice was often offered and sometimes accepted, and he personally led several charges of the French up to the British squares. But when all was lost, his courage was extinguished. He made no attempt to second Davout and Grouchy in the last days of Napoleon's reign, and in despair advocated the restoration of the Bourbons. Soon a fresh order was issued denouncing him by name, and he was arrested on Aug. 5. When Louis heard of Ney's arrest he exclaimed, "By letting himself be caught he has done us more harm than he did on the 13th of March!" But neither king nor ministers were in a position to resist the clamour of the ultra-royalists for blood. Every fresh delay in the process of Ney's trial raised a new outcry at the court, in the salons and in the Chamber of Deputies; and fiercest of all in demanding immediate execution was the king's niece, the unhappy duchess of Angoulême, who lived to confess that had she known the record of Ney's services to France she would never have consented to his death. Ney was placed on trial before a court martial composed chiefly of his former brothers-in-arms, whose participation in the tragedy was probably never forgiven them by their countrymen. Others of the marshal's old comrades refused to serve, and were disgraced in consequence, until public opinion forced their reinstatement. The court took advantage of the plea of Ney's counsel that he was entitled to be tried by his equals in the Chamber of Peers. In spite of the courageous and eloquent appeal of the young duc de Broglie, the result of the trial before the latter body was a foregone conclusion; de Broglie was alone in voting for his acquittal. In the early morning of Dec. 7, 1815, Ney was shot in the Luxembourg gardens, near the Observatory. He met his death quietly and with a perfect soldierly dignity.

Ney left materials for memoirs, but in an incomplete state. The *Mémoires du maréchal Ney,* published in 1833, were collected from these papers by his brother-in-law Gamot and by General Foy. They cover only the earlier part of his career, and end with the battle of Elchingen (October 1805). An edition in English was published the same year.

Delmas, *Mémoire sur la révision du procès du maréchal Ney* (1832); *Military Studies by Marshal Ney* (Eng. trans., 1833); G. A. B. E. H. Bonnal, *La Vie Militaire du maréchal Ney* (1910, etc.); R. Androix, *Ney* (1914).

NEZ PERCÉ, a tribe of Sahaptin lineage on Snake river in Idaho and Oregon, now on Lapwai reservation, Idaho. The estimated population was 6,000 in 1805, 1,400 in 1885, 1,500 in 1921. In 1877, under Chief Joseph, they fought the United States, winning some engagements and engaging in a notable but finally unsuccessful retreat almost to Canada. They were the largest and easternmost Sahaptin tribe and most affected by influences from the Plains Indians.

NGAMI, a shallow lake of variable size forming the centre of an inland drainage system in the Bechuanaland (*q.v.*) Protectorate, South Africa. The lake once extended to a length of 20 m. and a width of 10 m., but is now little more than an expanse of reeds growing in a soft soil, below which brackish water is found. It is cut by 20½° S. and 23° E. Ngami is the lowest point of a large depression in the great plateau of South Africa. The area which drains to it is bounded south by the basin of the Orange, east by the Matabele hills, north by the western affluents of the Zambezi. The greater part of the Ngami water-system lies, however, north-west of the lake in the Angola highlands. On the high plateau of Bihe, in the hinterland of Benguella, rise two large rivers, the Okavango and the Kwito, which uniting discharge their waters into Ngami. From the north-east end of Ngami issues the Botletle or Zuga, a stream which runs south-east and drains towards the Makarikari marsh, from which there is no outlet.

Although Ngami has contracted in size in modern times the Okavango and its tributary the Kwito remain large rivers. The Okavango is known in its upper course as the Kubango. Its most remote source lies in about 12½° S. and 16½° E. and its length is over 900 m. It flows first south then south-east and east. In about 18° S. and 20½° E. it is joined on the north bank by the Kwito, a large navigable stream rising almost as far north as the Okavango. Its general course is south-east, but between 15° and 17° S. it flows south and even south-west. Below the Kwito confluence the Okavango, which is also joined by various streams from the south-west, is a rapid stream, generally navigable as far as the Popa falls, in 21° 50′ E. In the dry season, the water-level is from 4 to 20 ft. below the banks, but these are overflowed during the rains. At this period, April–June, some of the surplus water finds its way (in about 19° S.) by the Magwekwana to the Kwando or Linyanti (Zambezi system), to which, it is thought, the whole body of water may have once flowed. Below the Magwekwana outlet the Okavango, now called the Taukhe or Tioghe, turns almost due south, enters a swampy reed-covered plain and is broken into several branches. In this region the effects of desiccation are marked. Through the swamps the river formerly entered Ngami. Through the swamp some of the waters of the Okavango find their way eastward through a channel called Tamalakane to the Zuga or Botletle, the river which formerly flowed out of Ngami. The Botletle, whose bed is about 100 m. in length, loses itself in a system of salt-pans—round or oval basins of varying size sunk to a depth of 30 to 45 ft. in the sandstone, and often bounded by steep banks. The outer pans are dry for a large part of the year, the whole system being filled only at the height of the flood-season in August. The Botletle, which receives in addition the scanty waters of the northern Kalahari, at this season reaches the Makarikari marsh. In 1849 Livingstone found a large shallow lake. In 1896 Lugard and Passarge both found none. (*See* S. Passarge, *Die Kalahari,* 1904.)

NIAGARA, FORT, an American fortification, on the east side and at the mouth of Niagara river, opposite the Canadian village of Niagara-on-the-Lake. Ft. Niagara has a reservation of 288 ac., with fairly modern equipments, and several historic

buildings of the time of French and of British possession, in one of which, the old magazine (1757), William Morgan was imprisoned in 1826. Fort Niagara was long, especially during the French occupation of Canada, one of the most important forts in North America, being the key to the Great Lakes, beyond Lake Ontario. La Salle wintered here in 1678–9, built his ship the "Griffon," and established a trading post and Fort Conti, destroyed not long afterwards. Fort Denonville, built in 1687 by Jacques René de Brésay, marquis de Denonville, governor-general of Canada, in his cruel campaign against the Iroquois, was abandoned in 1688, after the garrison, commanded by Pierre de Troyes (d. 1687), had been wiped out by an epidemic. The first Fort Niagara, to be so named, was built in 1725–1727 at the instance of Charles le Moyne, 1st baron of Longueil (1656–1729), and became a very important military and trading post; the fort was rebuilt by François Pouchot (1712–1769) in 1756, but in July 1759, after a siege of about sixteen days, it was surrendered to Sir William Johnson by Pouchot. On the 14th of September 1763 a British force marching from Fort Schlosser (about 2 mi. above the Falls; built 1761) to Fort Niagara was ambushed by Indians, who threw most of their captives into Devil's Hole, along the Niagara river. In July 1764 a treaty with the Indians was signed here, which detached some of them from Pontiac's conspiracy. Joseph Brant, John Butler and, in general, the Indians of northwestern New York favouring the British during the Revolutionary War, made Fort Niagara their headquarters, whence they ravaged the frontier, and many loyalists and Indians took refuge here at the time of Gen. Sullivan's expedition into western New York in 1779. The fort was not surrendered to the United States until Aug. 1796. In the War of 1812 it was bombarded by the guns of Ft. George immediately across the river, and on Dec. 19, 1813 was surprised and taken by assault—most of the garrison being killed or taken prisoners—by British troops under John Murray. After the close of the war, on March 27, 1815, Ft. Niagara was restored to the United States, and a garrison was kept there until 1826. The fort was regarrisoned about 1836, and remained a post of the regular army until it was abandoned on Dec. 31, 1945.

See F. H. Severance, *An Old Frontier of France* (1917); L. L. Babcock, *War of 1812 on the Niagara Frontier* (1927); *Publications of the Buffalo Historical Society;* F. Parkman, *Conspiracy of Pontiac* (1851) and *Montcalm and Wolfe* (1884).

NIAGARA FALLS (formerly Clifton or Suspension Bridge), a city and port of entry of Welland county, Ont., 40 mi. S.S.E. of Toronto, on the west bank of the Niagara river and opposite the falls. Pop. (1951) 22,874. It is a station on the Canadian National, the New York Central and the Wabash railways and is served by the Niagara, St. Catharines and Toronto electric railway by motor coach from St. Catharines. Three steel bridges (including the renowned Rainbow bridge) connect with the U.S. town of Niagara Falls on the opposite bank. Its importance is largely due to the tourist traffic, but the unrivalled water power is being more and more employed. Factories turn out shredded wheat, batteries, candies, razors, fertilizers, automotive equipment and other light manufactures. Large electric plants transmit power to Toronto and other cities. Beautiful Victoria park extends along the bank of the river for 2½ mi. above the falls, and there is a unique garden theatre.

NIAGARA FALLS, a city and a port of entry of Niagara county, N.Y., U.S., at the great falls of the Niagara river (*q.v.*) 22 mi. N.N.W. of Buffalo. It is served by the Lehigh Valley, the New York Central, the Erie and the Niagara Junction railways, and by American Airlines. Pop. (1950) 90,872; in 1940 it was 78,029 by the federal census.

Beginning 7 mi. above the falls the city extends along the Niagara river to the falls. Goat Island separates the American fall (167 ft. high and 1,000 ft. wide) from the Horseshoe fall on the Canadian side (160 ft. high, with a crest of more than 2,000 ft. in a deep curve), and between them is the delicate Bridal Veil. Below the falls the river rushes between perpendicular walls 250 ft. high, in a series of rapids to the whirlpool. Goat Island, several smaller islands and Prospect park (10 ac. on the brink of the gorge) were made a state reservation in 1885. In the evening the falls are illuminated with changing colours by gigantic search lamps set in Queen Victoria park across the river. Niagara falls probably attract more visitors than any other single natural phenomenon of America. To protect their aesthetic value, the amount of water which may be diverted from either the Canadian or the American fall is limited by an international treaty. Practically all the permitted U.S. diversion is utilized in a hydroelectric development with an installed hydroelectric capacity in 1951 of 415,000 kw., serving approximately 3,300,000 people.

The city is an important manufacturing centre, especially of the electrochemical and electrometallurgical industries which are largely concentrated there. Of particular importance are the manufacture of abrasives, shredded wheat, caustic soda, paper, electrodes, ferroalloys and a great variety of chemical compounds. The aggregate factory output at mid-20th century was valued at approximately $200,000,000. The assessed valuation of property was $167,684,907 in 1950. In 1916 Niagara Falls adopted a city-manager form of government. The city is the seat of Niagara university (Roman Catholic; 1856). Old Fort Niagara (*q.v.*), 14 mi. N., was restored to its original condition.

A fort (Little Niagara) was built on the site of Niagara Falls in 1750, and after its destruction Ft. Schlosser was built in 1761. In 1806 Judge Porter founded the village of Manchester there, on the banks of the falls. It was burned by the British in 1813, and remained a straggling little settlement until the construction of the Hydraulic canal in 1852 and the subsequent development (especially after 1877) of power from the falls. The first bridge across the river was completed in 1835; the first railroad bridge (a suspension bridge by John A. Roebling) in 1855. In 1892 the villages of Manchester and Suspension Bridge were merged and chartered as the city of Niagara Falls, which in 1900 had a population of 19,457. Electric energy generated from the falls was first used for lighting Prospect park in 1879, and in 1881 power was sold for commercial use; but the great modern development dates from World War I, and the city's growth as a manufacturing centre has followed the development of the power resources. The falls have been the scene of many daring exploits, ever since Sam Patch in 1829 successfully leaped into the river twice, only to lose his life in a similar leap at the Genesee falls in Rochester. Several men and women have safely plunged over the Canadian fall or through the whirlpool in barrels, and in 1859, and again in 1860 (on the occasion of the visit of Edward VII, then Prince of Wales) Blondin performed amazing feats on a tightrope stretched across the gorge.

NIAGARA RIVER flows in a northerly direction from Lake Erie to Lake Ontario, a distance of about 34 miles. It constitutes part of the boundary between the United States and Canada, separating the State of New York from the Province of Ontario. It is the principal drainage outlet of the four upper Great Lakes, whose aggregate basin area is about 248,500 sq. miles. Its discharges at standard low water and standard high water of Lake Erie (570 and 575.11 ft. above mean tide at New York) are about 153,000 and 267,000 second-feet, respectively. The river is navigable from its source to the upper rapids, 20 mi., and from Lewiston to the mouth, 7 miles. The current is rapid for the upper navigable portion, where the average fall is about 0.5 ft. per mile. The total fall of the lower 7 mi. is 0.5 foot. The intermediate section of the river, consisting of 7 mi., includes a series of rapids and Niagara Falls, and has a total fall of 315 feet. The average width is about 3,500 feet.

Niagara Falls.—The falls of Niagara are justly celebrated for their grandeur and beauty, and are viewed every year by over 2,000,000 visitors. They are in two principal parts, separated by an island. The greater division, adjoining the left bank, is called the Horseshoe fall; its height is 158 ft., and the length of its curving crest line is 2,600 ft. The American fall, adjoining the right bank, is 167 ft. high and 1,000 ft. broad.

The water is free from sediment, and its clearness contributes to the beauty of the cataract. In recognition of the importance of the waterfall as a great natural spectacle, the Province of Ontario and the State of New York have retained or acquired title to the adjacent lands and converted them into parks, which are main-

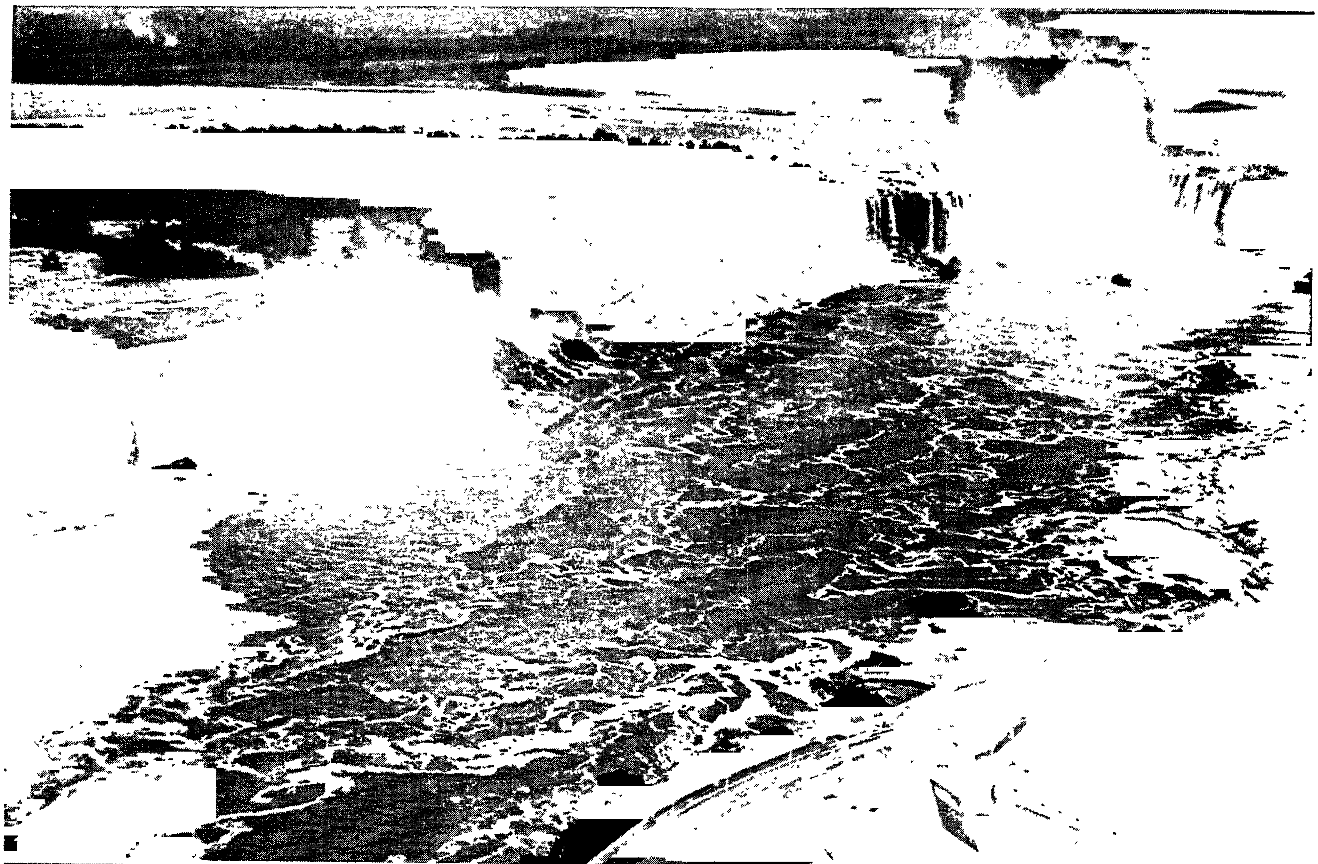
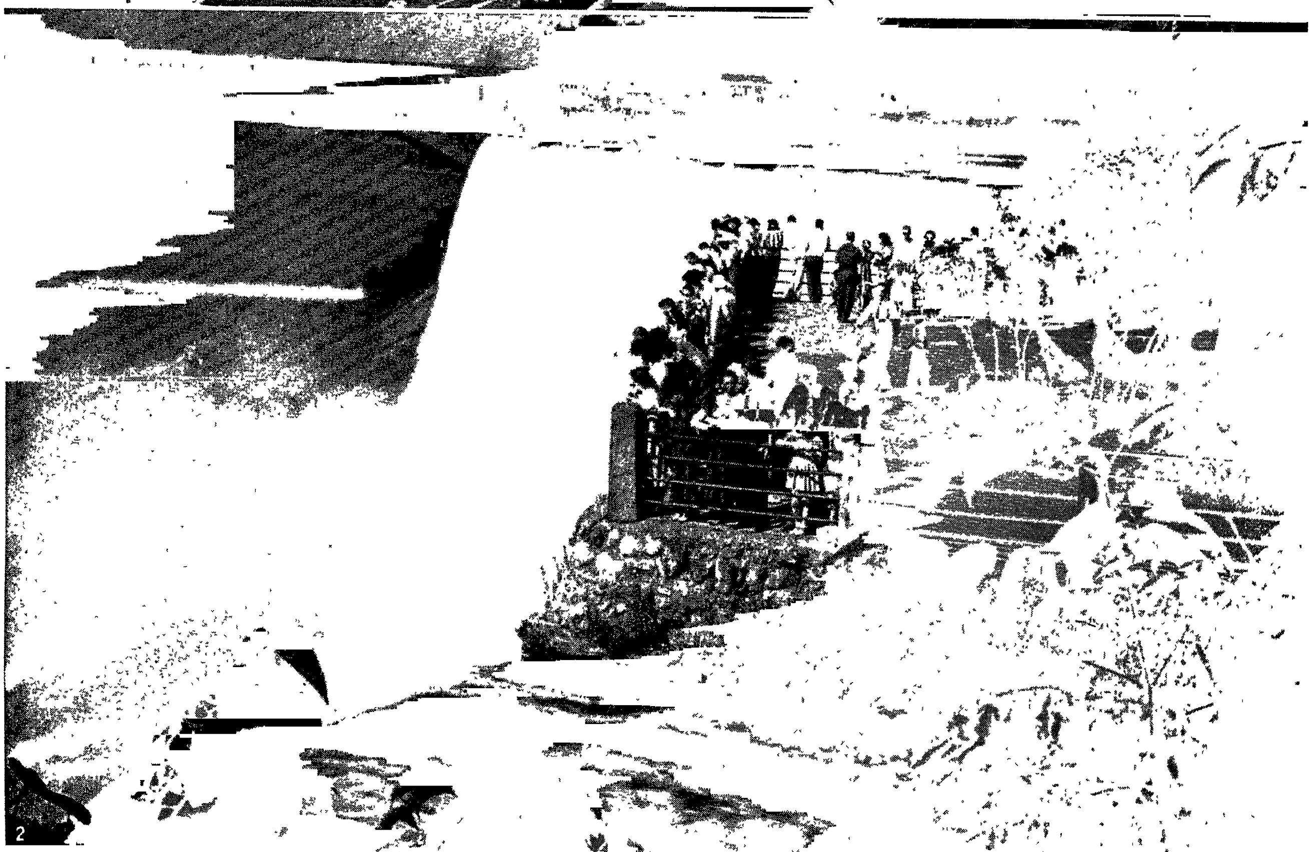
NIAGARA FALLS ON THE AMERICAN SIDE

The brink of the American Fall at Niagara, showing a point of Goat Island. The precipice on the American side is 167 feet in height

NIAGARA FALLS





PHOTOGRAPHS, (1) EWING GALLOWAY, (2) NINA LEEN-PIX FROM PUBLIX

1. An airview of Niagara Falls from Ontario, Canada. The Horseshoe (Canadian) Fall at the right, 158 ft. high, is about 10 ft. lower than the American Fall, but is more than twice as long. The two falls are separated by Goat island

2. Top of the American Fall, with the observation platform for sightseers. The International bridge is at the left

tained at public expense for the convenience of visitors.

The scenic grandeur of Niagara falls depends upon the volume of water flowing over the falls, but also on its distribution as it approaches the crest. The statement that the Horseshoe fall is in danger of destroying itself as a spectacle by cutting a narrow "notch," destroying the symmetry of the horseshoe, possibly degenerating into a cascade and eventually draining the American falls, has unfortunately been widely circulated. The mean annual rate of recession of the crest at the central part of the Horseshoe has been determined as being about 5 ft. since 1764, 3.7 ft. since 1842 and 2.3 ft. per year since 1906.

The Horseshoe later cut back at a decreasing rate, the rate continuing to decrease. The recession of the American falls is negligible. By proper action, supervision and control by the two governments concerned, the scenic beauty of the falls can be preserved, the tendency toward erosion in the Horseshoe can be checked, water can be distributed over the at present bared flanks of the Canadian fall and a more dependable flow over the American fall ensured.

Geologic Age.—The problem of the river's age is of much interest to geologists, because its solution would aid in establishing a relation between the periods and ages of geologic time and the centuries of human chronology. The great Canadian glacier, which in the glacial period alternately crowded forward over the Great Lakes region and melted back again, so modified the face of the land by erosion and by the deposit of drift that the waters afterward had to find new courses. The Niagara river came into existence when the waning of the glacier laid bare the western part of the Ontario basin, and the making of the gorge was then begun.

If it were supposable that the lengthening of the gorge proceeded at a uniform rate, the computation of the time would be easy, but there are various modifying conditions. A weighing of the available evidence indicated 25,000 years as a lower limit for plausible estimates of the age of the river, but yields no suggestion of an upper limit.

Navigation.—Between Lake Erie and Lake Ontario, navigation passes through the Canadian Welland canal. The old canal had 25 lift locks, with a total lift of 326¾ ft. These locks were each 270 ft. long (usable length about 255 ft.) by 45 ft. wide, and were designed to have 14 ft. depth on the sills. A new canal, constructed by Canada and opened to navigation on April 20, 1931, was formally opened, August 6, 1932. Calculated to admit the largest existing lake freighters, its southern portion is for the most part an enlargement of the old canal. The northern portion follows a new course, entering Lake Ontario at Port Weller, about three miles east of the terminus of the old canal. The new canal is 27.6 mi. long and has a total lockage of 325½ ft. It has four single locks, one flight of three double locks and one guard lock. The locks have a usable length of 820 ft., a clear width of 80 ft., and 30 ft. depth of water on the sill at lowest lake stages. All locks have a lift of about 46 ft. The gates are of the mitering type. The prism is 200 ft. wide at the bottom, 310 ft. wide at the water line, and from 25 to 26½ ft. deep at low water. All masonry structures are so designed as to allow an ultimate deepening to 30 ft. at low water. The construction of this canal was commenced in 1913, it was largely suspended during World War I but was later resumed.

Water Diversion for Hydroelectric Power.—Under a treaty signed in 1950 between Canada and the U.S. the amount of water that might ultimately be diverted from the Niagara river for power purposes was estimated at 130,000 cu.ft. per second to be divided equally between Canada and the United States. Of the United States diversion about 32,500 cu.ft. per second was used during the early 1950s.

The hydroelectric capacity on the U.S. side was 415,000 kw., but this could be increased to approximately 1,695,000 kw. The net electric energy at the United States hydroelectric development at the Niagara river was approximately 3,880,000,000 kw.hr. in 1951. Much is used in nearby electrochemical industries for the manufacture of aluminum, ferrosilicon, carborundum, artificial graphite, liquid chlorine, calcium carbide, cyanamide and other products. The remainder is transmitted to various cities for miscellaneous uses. The maximum distance to which this power is transmitted is somewhat in excess of 200 miles. (E. JA.)

NIAM-NIAM: *see* AZANDE.

NIAS, largest of the chain of islands off the western coast of Sumatra, Indonesia. It is 80 mi. long and nearly 30 wide, hilly, with coasts rocky or sandy, and landing is often dangerous: it is partly volcanic and earthquakes occur. There are three small rivers. Pop. 170,000. The chief town and port is Gunungsitoli on the east coast.

The islets Nako, Bunga, etc., near the north and west coasts are inhabited by a race which appears to be Indonesian in character and to have some affinity with the Bataks of Sumatra. They squander their means on feasting and ornaments, but are hospitable and have a high code of sexual morality, any infringement of which is severely punished. Marriage is exogamic and wives are bought. At death, wife and property pass to a man's brother. Land belongs to the settler and is inherited in the direct line. A council of notables assists hereditary chiefs in administration. Slave trade was suppressed by the Dutch, who began trading there in 1669. Simple tattooing, teeth-filling and circumcision are practised. Weapons are carried and vendettas are common.

Houses are built on piles, and sometimes are fortified with double walls. They have windows, a common room in the centre, and separate rooms for the various families which occupy one house, the entrance being through the floor, from underneath, in the house centre. Houses of chiefs are costly and have carved statues, or seats of wood, or stone, outside.

The Niasese are pagans: human sacrifice on the death of a chief, also head-hunting, were prohibited by the Dutch. Statues of the household gods are hung up in the houses, the phallic symbol is known, and in South Nias menhirs and large dissoliths exist. The funeral rites of an important person are celebrated by the sacrifice of pigs.

There are good craftsmen in gold, silver and wood. The coconut is cultivated and the oil traded with Malay and Achinese settlers, or taken to the Sumatran coast. Pigs are kept and form an important article of trade. Coal of poor quality, iron and copper have been found; gold is said to exist.

Nias is administrated by the residency of Tapanuli, in Sumatra; it came under Japanese control during World War II. It has no telegraphic or steamer communication with the mainland.

NIBELUNGENLIED, or DER NIBELUNGE NÔT, a mediaeval German heroic epic. The story on which it is based belongs to the general stock of Teutonic saga, and was very widespread under various forms, some of which are preserved. Thus it is touched upon in *Beowulf*, and fragments of it form the most important part of the northern *Eddas*, the poets of which evidently assumed that the tale as a whole was well known and that their hearers would be able to put each piece in its proper place. In the prose *Edda*, or *Volsungasaga*, which though largely primitive in spirit dates from the 13th century, it is set forth in full. The substance of this Norse version is as follows:—

"The three Anses—Odin, Loki and Hörnir—saw an otter devouring a salmon beside a waterfall. They killed and skinned the otter and, taking the skin with them, sought shelter for the night with Rodmar the giant. But Rodmar recognized the skin as that of his son, and demanded as *weregild* gold enough to cover it completely. Loki thereupon went back to the stream, where Andvari in the form of a pike was guarding a great treasure, caught him in a net, and forced him to surrender his hoard. But the piled-up gold left one hair exposed; in order to cover it Loki returned to Andvari and forced him to surrender a magic ring, which had the virtue of breeding gold. Thereupon Andvari, enraged, laid upon the hoard and all who should possess it a curse. This curse, the *Leitmotif* of the whole story, began to operate at once. Rodmar, for the sake of the treasure, was slain by his sons Fafnir and Regin; and Fafnir, seizing the whole, retired to a desolate heath and in the form of a snake or dragon brooded over the hoard. Regin, cheated of his share, plotted vengeance

and conquest of the treasure.

"To Regin, a notable smith, was sent Sigurd—son of the slain hero Sigmundr the Volsung and his wife Hiortis, now wife of the Danish king Alf—to be trained in his craft. To him Regin told of Fafnir and the hoard, and the young hero offered to go out against the dragon if Regin would weld him a sword. But every brand forged by the smith broke under Sigurd's stroke; till at last he fetched the fragments of the sword Gram, Odin's gift to his father, which Hiortis had carefully treasured. These Sigurd forged into a new sword, so hard that with it he could cleave the anvil, and so sharp that it would sever a flock of wool floating against it down stream; and, so armed, he sought and slew the dragon. But while roasting Fafnir's heart, which Regin had cut out, Sigurd burned his finger with the boiling fat and, placing it to his lips, found that he could understand the language of birds, and so learned from the chattering of the woodpeckers that Regin was planning treachery. Thereupon he slew the smith, and loading the treasure on the magic steed Grani, given to him by Odin, set out on his travels.

"On a fire-girt hill Sigurd found the Valkyrie Brunhild in an enchanted sleep, and ravished by her beauty awakened her; they plighted their troth to each other and, next morning, Sigurd left her to set out once more on his journey. Coming to the court of Giuki, a king in the Rhine country, Sigurd formed a friendship with his three sons, Gunnar, Hogni and Guthorm; and, in order to retain so valuable an ally, it was determined to arrange a match between him and their sister Gudrun. Queen Grimhild, skilled in magic, therefore gave him an enchanted drink, which caused him to forget Brunhild. Gunnar, on the other hand, wished to make Brunhild his wife, and asked Sigurd to ride with him on this quest, which he consented to do on condition of receiving Gudrun to wife. They set out; but Gunnar was unable to pass the circle of fire round Brunhild's abode, the achievement that was the condition of winning her hand. So Sigurd, assuming Gunnar's shape, rode through the flames on his magic horse, and in sign of troth exchanged rings with the Valkyrie, giving her the ring of Andvari. So Gunnar and Brunhild were wedded, and Sigurd, resuming his own form, rode back with them to Giuki's court, where the double marriage was celebrated. But Brunhild was moody and suspicious, remembering her troth with Sigurd and believing that he alone could have accomplished the quest.

"One day the two queens, while bathing in the river, fell to quarrelling as to which of their husbands was the greater. Brunhild taunted Gudrun with the fact that Sigurd was Gunnar's vassal, whereupon Gudrun retorted by telling her that it was not Gunnar but Sigurd who rode through the flames, and in proof of this held up Brunhild's ring which Sigurd had given to her. Brunhild, maddened by jealousy and wounded pride, now incited the three kings to murder Sigurd by exciting their jealousy of his power. The two elder, as bound to him by blood-brotherhood, refused; but the youngest, Guthorm, who had sworn no oaths, consented to do the deed. Twice he crept into Sigurd's chamber, but fled when he found the hero awake and gazing at him with flashing eyes. The third time, finding him asleep, he stabbed him; but Sigurd, before he died, had just strength enough to hurl his sword at the murderer, whom it cut in two. Brunhild, when she heard Gudrun wailing, laughed aloud. But her love for Sigurd was great as ever, and she determined not to survive him; distributing her wealth to her hand-maidens she mounted Sigurd's funeral pyre, slew herself with his sword, and was burnt with him.

"In course of time Gudrun married Atli (Attila), king of the Huns, Brunhild's brother. Atli, intent on getting hold of the hoard which Gudrun's brothers had seized, invited them to come to his court. In spite of their sister's warnings they came, after sinking the treasure in the Rhine. On their refusal to surrender the hoard or to say where it was concealed, a fierce fight broke out in which all the followers of Gunnar and Hogni fell. Atli then once more offered to spare Gunnar's life if he would reveal his secret; but Gunnar refused to do so until he should see the heart of Hogni. So Hogni's heart was cut out, the victim laughing the while; but when Gunnar saw it he cried out that now he alone knew where the hoard was and that he would never reveal the secret. His hands were then bound, and he was cast into a den of venomous serpents; but he played so sweetly on the harp with his toes that he charmed the reptiles, except one adder, by which he was stung to death. Gudrun, however, avenged the death of her brothers by slaying the sons she had borne to Atli and causing him unwittingly to drink their blood and eat their hearts. Finally, in the night, she killed Atli himself and burned his hall; then, leaping into the sea, she was carried by the waves to new scenes, where she had adventures not connected with those recorded in the *Nibelungenlied.*"

This story, in spite of the late date of the *Volsungasaga,* represents a very primitive version. The setting of the *Nibelungen* story, on the other hand, is mediaeval rather than primitive, though its extant versions are of much earlier date, and it contains primitive elements not found in the other. Everywhere the supernatural elements are eliminated or subordinated. The gods have vanished from the scene; there is nothing of Loki and his theft of Andvar's hoard, nothing of Odin and his gifts of the sword Gram, and the magic horse Grani; and not till the third *Aventiure,* when Siegfried comes to Worms, are we given even a hint that such things as the sword and treasure exist.

In the legend of Sigurd the Volsung, the plot had turned upon the love and vengeance of Brunhild, so in the song of the Nibelungs it is the love and vengeance of Kriemhild, the Gudrun of the northern saga, that forms the backbone of the story and gives it from first to last an artistic unity which the *Volsungasaga* lacks. The tragedy of the close of the story is emphasized by the pomp and circumstance that surround the ill-fated hero. The primitive setting of the northern version has vanished utterly. Sigmund is king of the Netherlands; the boy Siegfried is brought up by "wise men that are his tutors" (*Avent.* ii.); and when, attracted by the fame of Kriemhild's beauty, he rides to Worms to woo her, it is as the typical handsome, accomplished and chivalrous king's son of mediaeval romance.

It is at this point (*Avent.* iv.) that some primitive elements are suddenly and awkwardly introduced. As Siegfried approaches Worms, Kriemhild's brothers, the Burgundian kings Gunther, Giselhêr and Gêrnot watch his coming, and to them their faithful retainer, "the grim Hagen," explains who he is. This can be no other than the hero who slew the two kings of the Nibelungs, Schilbunc and Nibelunc, and seized their treasure, together with the sword Balmunc and the *tarnkappe,* or cape of darkness, which has the virtue of making him who wears it invisible. Another adventure, too, he can tell of him, namely, how he slew a dragon and how by bathing in its blood his skin became horny, so that no weapon could wound him save in one place, where a linden leaf had fallen upon him as he stooped, so that the blood did not touch this spot. In spite of Hagen's distrust and misgivings, Siegfried now fights as the ally of the Burgundians against the Saxons (*Avent.* iv.), and undertakes, on condition of receiving Kriemhild to wife, to help Gunther to woo Queen Brunhild, who can only be won by the man who can overcome her in three trials of strength (*Avent.* vi.). Siegfried and Gunther accordingly go together to Brunhild's castle of Isenstein in Iceland, and there the hero, invisible in his *tarnkappe,* stands beside Gunther, hurling the spear and putting the weight for him, and even leaping, with Gunther in his arms, far beyond the utmost limit that Brunhild can reach (*Avent.* vii.). Brunhild confesses herself beaten and returns with the others to Worms, where the double marriage is celebrated with great pomp (*Avent.* x.). But Brunhild is ill content; though she saw Siegfried do homage to Gunther at Isenstein she is not convinced, and believes that Siegfried should have been her husband; and on the bridal night she vents her ill humour on the hapless Gunther by tying him up in a knot and hanging him on the wall. "I have brought the evil devil to my house!" he complains to Siegfried next morning; and once more the hero has to intervene; invisible in his *tarnkappe* he wrestles with Brunhild and, after a desperate struggle, takes from her her girdle and ring before yielding place to Gunther. The girdle and ring he gives to his wife Kriemhild (*Avent.* x.).

One day, while Siegfried and his wife were on a visit to the Burgundian court, the two queens fell to quarrelling on the ques-

tion of precedence, not in a river but on the steps of the cathedral (*Avent.* xiv.). Kriemhild was taunted with being the wife of Gunther's vassal; whereupon, in wrath, she showed Brunhild the ring and the golden girdle taken by Siegfried, proof that Siegfried, not Gunther, had won Brunhild. So far the story is essentially the same as that in the *Volsungasaga;* but now the plot changes. Brunhild drops out, becoming a figure altogether subordinate and shadowy. The death of Siegfried is compassed, not by her, but by the "grim" Hagen, Gunther's faithful henchman, who thinks the glory of his master unduly overshadowed by that of his vassal. Hagen easily pursuades the weak Gunther that the supposed insult to his honour can only be wiped out in Siegfried's blood; he worms the secret of the hero's vulnerable spot out of Kriemhild on pretence of shielding him from harm (*Avent.* xv.) and then arranges a great hunt in the forest, so that he may slay him when off his guard. The 16th *Aventiure* describing this hunt and the murder of Siegfried is perhaps the most powerful scene in all mediaeval epic. When the hunters sat down to feast, it was found that the wine had been forgotten. Hagen thereupon proposed that they should race to a spring some way off in the forest. Siegfried readily agreed, and though handicapped by carrying shield, sword and spear, easily reached the goal first, but waited, with his customary courtesy, until the king had arrived and drunk before slaking his own thirst. Then, laying aside his arms, he stooped and drank. Hagen, seizing the spear, thrust it through the spot marked by Kriemhild on Siegfried's surcoat. The hero sprang up and, finding that his sword had been removed, attacked Hagen with his shield.

Then reproaching them for their cowardice and treachery, Siegfried fell dying "amid the flowers" while the knights gathered round lamenting. The whole spirit of this scene is primitive Teutonic rather than mediaeval. The same is true, indeed, of the whole of the rest of the poem. Siegfried, to be sure, is buried with Catholic rites; but Kriemhild, while praying for his soul like a good Christian, plots horrible vengeance like her pagan prototype. Mistress now of the Nibelungen hoard, she sought to win a following by lavish largesses; but this Hagen frustrated by seizing the treasure, with the consent of the kings, and sinking it in the Rhine, all taking an oath never to reveal its hiding-place (*Avent.* xix.). At last, however, after 13 years, Kriemhild's chance came, with a proposal of marriage from Etzel (Attila) king of the Huns, which she accepted on condition that he would help her to vengeance (*Avent.* xx.). Then more years passed; old feuds seemed to be forgotten; and the Burgundian kings, in spite of Hagen's warnings, accepted their sister's invitation to visit her court (*Avent.* xxiii.–xxiv.).

The journey of the Burgundians into Hunland is described by the poet at great length (*Avent.* xxv.–xxvii.). From this point onward the story is dominated by the figure of the grim Hagen, who, twitted with cowardice and his advice spurned, is determined that there shall be no turning back and that they shall go through with it to the bitter end. With his own hands he ferries the host over the Danube and then destroys the boat, so that there may be no return. At Attila's court (*Avent.* xxviii.) it is again Hagen who provokes the catastrophe by taunting Kriemhild when she asks him if he has brought with him the hoard of the Nibelungs:

"The devil's what I bring you!" Hagen then replied,
"What with this heavy harness and my shield beside,
I had enough to carry; this helmet bright I brought;
My sword is in my right hand, and that, be sure, I bring you not!"

The sword was Siegfried's. It is Hagen, too, who after the first onslaught of the Huns, strikes off the head of Ortlieb, the son of Etzel and Kriemhild, and who, amid the smoke and carnage of the burning hall, bids the Burgundians drink blood if they are thirsty.

But for all their prowess, after a prolonged struggle (*Avent.* xxix.–xxxvii.) the Burgundians were at last overwhelmed. Most of the chief figures of heroic saga had come up against them; Attila, Hildebrand, the Ostrogoth Theodoric (Dietrich von Bern). To the last named even Hagen armed with Siegfried's sword had to yield (*Avent.* xxxviii.). Kriemhild came to him as he lay in bonds and demanded the Nibelung treasure. He refused to reveal its hiding place so long as Gunther, also a prisoner, should live. Gunther was accordingly slain by the queen's orders and his head was brought to Hagen, who cried out when he saw it that all had been accomplished as he had foretold:

"Now none knows where the hoard is save God and I alone:
That to thee, devil-woman, shall nevermore be known!"

Whereupon Kriemhild slew him with Siegfried's sword. But Kriemhild was not destined, like Gudrun, to set out on further adventures. Hildebrand, horrified at her deed, sprang forward and cut her to pieces with his sword.

In sorrow now was ended the king's high holiday,
As ever joy in sorrow ends and must end alway.

To some mss. of the *Nibelungenlied* is added a supplementary poem called the *Klage* or *Lament,* a sequel of 2,160 short-line couplets, describing the lament of the survivors—notably Etzel—over the slain, the burying of the dead, and the carrying of the news to the countries of the Burgundians and others. At the end it is stated that the story was written down, at the command of Bishop Pilgrim of Passau, by a writer named Konrad (Kuonrât) in Latin and that it had since been sung (*getichtet*) often in the German tongue.

Sources of the Story.—The origin and nature of the various elements that go to make up the story of the *Nibelungenlied* have been, and continue to be, the subject of debate. The view at one time most generally accepted was that first propounded by Karl Lachmann in his "Kritik der Sage von den Nibelungen" (*Rheinisches Museum für Philologie,* num. 249, 250, 1829, republished in his *Zu den Nibelungen . . . Anmerkungen* in 1836), namely that the story was originally a myth of the northern gods modified into a heroic saga after the introduction of Christianity, and intermingled with historical elements. This view was also maintained by Richard von Muth in his *Einleitung in das Nibelungenlied* (Paderborn, 1877). On the other hand, so early as 1783 Johannes von Müller of Göttingen had called attention to the historical figures appearing in the Nibelungenlied, identifying Etzel as Attila, Dietrich of Bern as Theodoric of Verona, and the Burgundian kings Gunther, Giselhêr and Gêrnot as the Gundaharius, Gislaharius and Godomar of the *Lex Burgundiorum;* in 1820, Julius Liechtlen (*Neuaufgefundenes Bruchstück des Nibelungenliedes,* Freiburg-im-Breisgau) roundly declared that "the *Nibelungenlied* rests entirely on a historical foundation, and that any other attempt to explain it must fail." This view was, however, overborne by the great authority of Lachmann, whose theory, in complete harmony with the principles popularized by the brothers Grimm, was accepted by a long series of critics. In later years criticism tended to revert to the standpoint of Müller and Leichtlen and to recognize in the story of the Nibelungen a misty and confused tradition of real events and people. Mythical elements it certainly contains; and to those figures which—like Siegfried, Brunhild, or Hagen—cannot be traced to historical originals, a mythical origin is still provisionally ascribed, though Theodor Abeling (*Das Nibelungenlied,* 1907) made out a plausible case for identifying Siegfried with Segerio, son of the Burgundian king Sigimund and Brunhild with the historical Brunichildis.

The basis of the story is then, according to this view, historical, not mythical; a medley of Franco-Burgundian historical traditions, overlaid with mythical fancies. The historical nucleus is the overthrow of the Burgundian kingdom of Gundahar by the Huns in 436; and round this there gathered an accretion of other episodes, equally historical in their origin, however distorted, with a naïve disregard of chronological possibility. In the *Eddas* the identity of the original Franco-Burgundian sagas is fairly preserved. In the *Nibelungenlied,* on the other hand, the influence of other wholly unconnected stories is felt: thus Hildebrand appears during the final fight at Etzel's court, and Theodoric the Great (Dietrich von Bern; *see* Theodoric).

Origin of the Poem.—The controversy as to the underlying elements of the Nibelung legend extends to the question of the authorship and construction of the poem itself. Was it from the first—whatever additions and interpolations may have followed—conceived as a single, coherent story, or is it based on a number

of separate stories, popular ballads akin to the *Eddas,* which the original author of the *Nibelungenlied* merely collected and strung together? The answer to these questions has been sought by a succession of scholars in a critical comparison of the mediaeval mss. of the poem still surviving. Of these 33 are now known, of which 10 are complete, the rest being more or less fragmentary. The most important are those first discovered, viz., the mss. lettered C (Hohenems 1755), B (Schloss Werdenberg, 1769), A (Hohenems 1779); and round these the others more or less group themselves. They exhibit many differences: put briefly C is the most perfectly finished in language and rhythm; A is rough, in places barbarous; B stands halfway between the two. Which is nearest to the original? Karl Lachmann (*Zu den Nibelungen und zur Klage, Anmerkungen,* 1836) decided in favour of A. He applied to the *Nibelungenlied* the method which Friedrich August Wolf had used to resolve the *Iliad* and *Odyssey* into their elements. The poem, according to Lachmann, was based on about 20 popular ballads, originally handed down orally, but written down about 1190 or 1200. This original is lost, and A—as its roughness of form shows—is nearest to it; all other mss. including B and C are expansions of A. Lachmann's view was first seriously assailed by Adolf Holtzmann (*Untersuchungen über das Nib.*, Stuttgart, 1854), who argued that the original could not have been strophic in form—the fourth lines of the strophes are certainly often of the nature of padding—that it was written by Konrad (Kuonrât of the *Klage*) writer to Bishop Pilgrim of Passau about 970–984, and that of existing mss. C is nearest to this original, B the copy of a ms. closely akin to C, and A an abbreviated corrupt copy of B. This view was adopted by Friedrich Zarncke, who made C the basis of his edition of the *Nibelungenlied* (Leipzig, 1856). A new hypothesis was developed by Karl Bartsch in his *Untersuchungen über das Nibelunglied* (Leipzig, 1865). According to this the original was an assonance poem of the 12th century, which was changed between 1190 and 1200 by two separate poets into two versions, in which pure rhymes were substituted for the earlier assonances; the originals of the *Nibelungenlied* and *Der Nibelunge Nôt* respectively. Bartsch's subsequent edition of the *Nibelunge Nôt* (1st ed., Leipzig, 1870) was founded on B, as the nearest to the original. To this view Zarncke was so far converted that in the 1887 edition of his *Nibelungenlied* he admitted that C shows signs of recension and that the B group is purer in certain details.

It is impossible here to follow the further developments of the question. Theodor Abeling's *Das Nibelungenlied und seine Literatur* gives a full bibliography from 1756 to 1905. Other important contributions are: Andreas Heusler, in the *Sitzungsberichte der Königl. Preuss. Akad. der Wissenschaften,* xlvii (1914), in which he investigates anew the genesis of the saga; Hermann Fischer, *Über die Entstehung des Nibelungenliedes, in Sitzungsber der Königl. Bayer. Akad. der Wiss., Philos. und hist. Klasse,* 1914, who traces the influences at work on the poem and concludes that it was written under that of Bishop Wolfger of Passau. With this Friedrich Wilhelm (in *Müncher Archiv,* part 7, 1916) is in agreement. There have also been during latter years advocates of a Latin original of the poem; *e.g.,* R. Pestalozzi, *Die Nibelungias* (*Neue Jahrbücher,* 39, 1916–17), but this idea is generally discredited. There are English translations of the poem by A. G. Foster-Barham (1887) and Margaret Armour (prose, 1897); and Alice Horton (1898). (W. A. P.)

See M. Thorp, *The Study of the Nibelungenlied* (1940).

NICAEA or Nice (mod. *Isnik, i.e., εἰς Νικαίαν*), an ancient town of Asia Minor, in Bithynia, on the Lake Ascania. Antigonus built the city (316 B.C.?) on an old deserted site, and soon afterward Lysimachus changed its name from Antigonia to Nicaea, calling it after his wife. Under the Roman empire Nicaea and Nicomedia disputed the title of metropolis of Bithynia. Strabo describes the ancient Nicaea as built regularly, in the form of a square, with a gate in the middle of each side. From a monument in the centre of the city all the four gates were visible at the extremities of great cross streets. After Constantinople became the capital of the empire Nicaea grew in importance, and after the conquest of Constantinople by the crusaders became the temporary seat of the Byzantine emperor; the double line of walls with the Roman gates is still well preserved. The possession of the city was long disputed between the Greeks and the Turks. It remained an important city for some time after its final incorporation in the Ottoman empire; but became subsequently an insignificant village.

NICAEA, COUNCIL OF. The Council of Nicaea (A.D. 325) is an event of the highest importance in the history of Christianity. Its convocation by Constantine and its course illustrate the radical revolution which the position of this religion, within the confines of the Roman empire, had undergone in consequence of the Edict of Milan. From his accession Constantine had shown himself the friend of the Christians; and, when his victory over Licinius (A.D. 323) gave him undisputed possession of the crown, he adhered to this religious policy, distinguishing and fortifying the Christian cause by gratuities and grants of privilege. This propitiatory attitude originated in the fact that he recognized Christianity—which had successfully braved so many persecutions—as the most vital and vigorous of religions, and as the power of the future. Consequently he directed his energies toward the establishment of a positive relationship between it and the Roman state. But the church could only maintain its great value for the politician by remaining the same compact organism which it had proved itself to be under the stormy reign of Diocletian. Scarcely, however, did it find itself in the enjoyment of peaceful relations with the state, when violent feuds broke out in its midst, whose extent, and the virulence with which they were waged, threatened to dismember the whole religious body. Donatism in the west was followed by the Arian struggle in the east. The former movement had been successfully arrested, though it survived in North Africa till the 5th century. The conflict kindled by the Alexandrian presbyter Arius with regard to the relation of Christ to God assumed a more formidable character (*see* Arius). Constantine therefore had recourse to an institution previously evolved by the Christian Church—the convocation of a synod to pronounce on burning questions—enlarging it, however, to correspond with the altered circumstances. He convened a council, designed to represent the whole church of the empire, at Nicaea in Bithynia, a town situated no great way from the imperial summer residence of Nicomedia and within easy reach by sea of the oriental bishops. In consequence of the vast distances, the west was not largely represented, but the able theologian Hosius, bishop of Cordova, was present. The three most important bishoprics of the east were represented (Alexandria, Antioch and Jerusalem); a prominent part was also taken by Eusebius, bishop of Nicomedia, and his namesake of Caesarea (the historian), along with a very large number of others from the east. Among the attendant clergy, the still youthful deacon Athanasius, destined to succeed Alexander in the see of Alexandria, was prominent as the most powerful antagonist of Arianism (*see* Athanasius "The Great"). The synod sat from May 20 to July 25.

The deliberations on the Arian question passed through several distinct stages before the final condemnation of Arius and his doctrines was reached. A clearly defined standpoint with regard to this problem—the relationship of Christ to God—was held only by the comparatively small group of Arians and a not much larger group who adhered with unshaken conviction to the Alexandrian view. The bulk of the members occupied a position between these two extremes. They rejected the formulas of Arius, and declined to accept those of his opponent; that is to say, they were merely competent to establish negations, but lacked the capacity, as yet, to give their attitude of compromise a positive expression. That the majority of the council should have adopted this neutral tendency is easily intelligible when we consider the state of theology at that period. True, at Nicaea this majority eventually acquiesced in the ruling of the Alexandrians; yet this result was due, not to internal conviction, but partly to indifference, partly to the pressure of the imperial will—a fact which is mainly demonstrated by the subsequent history of the Arian conflicts. For if the Nicaean synod had arrived at its final decision by the conscientious agreement of all non-Arians, then the confession of faith there formulated might indeed have evoked the continued antagonism of the Arians, but must necessarily have

been championed by all else. This, however, was not the case; in fact, the creed was assailed by those very bodies which had composed the *laissez-faire* centre at Nicaea; and we are compelled to the conclusion that, in this point, the voting was no criterion of the inward convictions of the council.

In the synod, an Arian confession of faith was first brought forward and read; but it aroused such a storm of indignation that obviously, in the interests of a restoration of ecclesiastical peace, there could be no question of its acceptance. On this, Eusebius of Caesarea submitted the baptismal creed of his community. Since the creed dated from a period anterior to the outbreak of the Arian struggle, its reception would have been equivalent to a declaration on the part of the council that it declined to define its position with reference to the controversy of the hour. That the greater number of delegates were not disinclined to adopt this subterfuge, and to shelve the actual solution of the whole problem by recognition of this or some similar neutral formula, is extremely probable. But the emperor saw that, if the difficulties were eluded in any such way, it was inevitable from the very nature of the case, that they should rise again in an accentuated form, and that consequently no pacification could be expected from this policy.

Accordingly Constantine proposed that the Caesarean creed should be modified by the insertion of the Alexandrian passwords (including the decisive term ὁμοούσιος, "identical in nature"), as if for the purpose of more accurate definition, and by the deletion of certain portions. That he appreciated the import of these alterations, or realized that this revision was virtually the proclamation of a new doctrine, is scarcely probable. The creed thus evolved by an artificial unity was no ratification of peace: in fact, it paved the way for a struggle which convulsed the whole empire. For it was the proclamation of the Nicene Creed that first opened the eyes of many bishops to the significance of the problem there treated; and its explanation led the Church to force herself, by an arduous path of theological work, into compliance with those principles, enunciated at Nicaea, to which, in the year 325, she had pledged herself without genuine assent.

BIBLIOGRAPHY.—*See* the Histories of Dogma by Harnack, Loofs and Seeberg; articles in Hastings, *Encyclopaedia of Religion and Ethics* and Herzog-Hauck, *Realencyklopädie,* 3rd ed.; Bethune-Baker, *Introduction to the early History of Christian Doctrine;* Gore, *Dissertations on Subjects connected with the Incarnation;* and (from another point of view) Mellone, "Athanasius the Modernist" in *The Price of Progress* (1924). In addition to the Arian problem, the council dealt with the question of the "lapsed" in the recent persecution, the question of "heretical baptism" and other matters (*see* Hefele, *History of Councils,* vol. i.).

NICANDER (2nd cent. B.C.), Greek poet, physician and grammarian, was born at Claros, near Colophon, where his family held the hereditary priesthood of Apollo. He flourished under Attalus III of Pergamum. He wrote a number of works both in prose and verse, of which two are preserved. The longest, *Theriaca,* is a hexameter poem (958 lines) on the nature of venomous animals and the wounds which they inflict. The other, *Alexipharmaca,* consists of 630 hexameters treating of poisons and their antidotes. In his facts Nicander followed the physician Apollodorus. Among his lost works may be mentioned: *Aetolica,* a prose history of Aetolia; *Heteroeumena,* a mythological epic, used by Ovid in the *Metamorphoses* and epitomized by Antoninus Liberalis; *Georgica* and *Melissourgica,* of which considerable fragments are preserved, said to have been imitated by Virgil (Quintilian x. 1. 56).

The works of Nicander were praised by Cicero (*De oratore,* i, 16), imitated by Ovid, and frequently quoted by Pliny and other writers. His reputation does not seem justified; his works, as Plutarch says (*De audiendis poetis,* 16), have nothing poetical about them except the metre, and the style is bombastic and obscure; but they contain some interesting information as to ancient belief on the subjects treated.

The Scholia (from the Göttingen ms.) have been edited by G. Wentzel in *Abhandlungen der k. Gesellschaft der Wiss. zu Göttingen,* xxxviii. (1892). *See* also W. Vollgraff, *Nikander und Ovid* (Groningen, 1909 *seq.*).

NICANOR, Greek grammarian, son of Hermeias of Alexandria (or Hierapolis), lived during the reign of the Roman emperor Hadrian (A.D. 117–138).

He devoted himself chiefly to the study of punctuation and the difference of meaning caused by it. Hence he was nicknamed the Punctuator. He is known to have written on the punctuation of Homer and Callimachus. He was possibly the author of a work *On the Change of Names of Places,* of which some fragments were preserved in C. W. Müller's *Fragmenta Historicorum Graecorum,* iii, 632.

See edition of the *Iliad* and *Odyssey* fragments by L. Friedlander (1850) and O. Carnuth (1875) respectively.

NICARAGUA, the largest country of Central America, lying between Honduras and Costa Rica, which form its north and south boundaries, respectively, and reaching from the Caribbean sea on the east to the Pacific ocean on the west. Its area, which is still undetermined owing to boundary disputes with Honduras and incomplete surveys, is generally put at from 49,200 to 51,660 sq.mi., the former being the most generally accepted.

The coast line is about 300 mi. on the Caribbean and 200 mi. on the Pacific.

The Honduran boundary as generally accepted starts at Cape Gracias a Dios, follows the Segovia river inland and then at 86° W. takes an imaginary line to the upper waters of the Río Negro, which it follows to the Gulf of Fonseca. The Costa Rican boundary is now agreed upon, under treaties of 1858, confirmed in 1888 and settled in 1896, to be a line 2 mi. S. of the San Juan river and Lake Nicaragua.

Physical Features.—Nicaragua is crossed by the two mountain chains that traverse the western hemisphere, and which provide some fine highland valleys. Its most striking natural features, however, are the two great lakes, Lake Nicaragua, about 100 mi. long and 45 mi. wide, and Lake Managua, to the north of it, and connected with it by the Tipitapa river. Lake Managua's length is 38 mi. and its width varies from 10 mi. to 16 mi.

The surface of the country is naturally divided into five clearly

SCENE IN A JUNGLE SWAMP OF THE LOW COAST-LAND OF NICARAGUA

distinct zones: (1) the series of volcanic peaks which extend parallel to the Pacific at a little distance inland; (2) the plains and lakes of the great depression which lies to the east of these mountains and stretches from sea to sea, between the Bay of Fonseca and the mouths of the San Juan; (3) the main cordillera, which skirts the depression on the east, and trends northwest from Monkey Point or Punta Mico on the Caribbean sea, until it is merged in the ramifications of the Honduran and Salvadoran highlands; (4) the plateaus which slope gradually away from the main cordillera towards the Caribbean; (5) the east or Mosquito coast (*see* MISKITO COAST), with its low-lying hinterland. The chain of volcanic cones, which constitutes a watershed quite equal in importance to the cordillera itself, consists for the most part of isolated igneous peaks, sometimes connected by low intervening ridges.

The main Nicaraguan cordillera, which flanks the depression on

the east, has often been called the Cordillera de los Andes, from its supposed continuity with the mountain chains of Panamá and the west coast of South America. There is in fact no such continuity, for the San Juan valley completely separates the mountains of Panamá from the main Nicaraguan system. The main cordillera bears different names in different parts of Nicaragua. Thus the important section which terminates at Monkey Point is commonly called the Cordillera de Yolaina. The summits of the main cordillera seem nowhere to exceed 7,000 ft. in altitude; the mean elevation is probably less than 2,000 ft.; the declivity is sheer toward the lakes, and gradual toward the Caribbean. On the east, the cordillera abuts upon the region of plateaus and savannas, which occupies nearly half of the area of Nicaragua.

Climate.—The climate along the coasts, where most of the population lives, is hot and often sultry; in the highland sections there is the usual relatively cool and even climate of the tropical upland. There are two seasons, wet and dry, the former extending from May or June to November or December and dry in the remaining period, although on the east coast, the rainy season often extends well into the so-called dry period. Rainfall varies in different sections, as much as 297 in. a year having been recorded at Bluefields, on the Caribbean coast; the mean at Rivas, on the Pacific side, is 102 in. a year.

History.—The history of Nicaragua in connection with the other Central American countries and down to the dissolution of the union is discussed in the article on CENTRAL AMERICA. The first white man to see Nicaragua was Gil González de Avila, who landed on the coast of Chiriquí in 1522. The leading Indian tribe of the country was then led by a great chief called Nicaragua, from whom the country derived its name. Nicaragua was baptized, and his tribe converted to the Roman Catholic faith and moved with the Spaniards to the conquest of the other tribes.

Hernán de Córdoba, who succeeded Gil González in command of the province for Spain, founded Granada in 1524, the city then being situated between the two great lakes. Nicaragua was incorporated, for administrative purposes, in the captaincy general of Guatemala.

Nicaragua, with independent existence dating from the dissolution of the Central American union in 1838, early developed into a battleground for the two rival cities of León and Granada, the former the capital of the Liberals, the latter of the Conservatives. In 1856 the American filibusterer, William Walker (*q.v.*), arrived with his 66 followers, espousing the cause of León and waging a bitter war against the Granadinos which ended in his execution in 1860. Both the United States and Great Britain, through their agents, took active but undercover parts in the Walker episode.

Nicaragua had open difficulties with various foreign powers, chiefly the United States and Great Britain, almost throughout the 19th century. The Mosquito Indians on the Caribbean coast, under the protection of Great Britain, gave that power a claim to Nicaraguan territory until 1850 when the Clayton-Bulwer treaty between Great Britain and the United States stipulated that neither party could occupy, fortify, colonize or exercise dominion over any portion of Central American territory. Actual transfer of the Mosquito territory did not take place, however, until 1893, when Nicaragua occupied it by force. The Clayton-Bulwer treaty also neutralized any canal which should be constructed across Nicaragua by either Great Britain or the United States. Other European powers became involved with Nicaragua during the ensuing years. In 1875, Germany and, in 1895, Great Britain, blockaded Nicaraguan ports to force redress of injuries.

In 1909, two Americans, Cannon and Groce, were executed, after torture, and this led to a U.S. naval demonstration and demands, and was one of the direct elements leading to U.S. intervention. A period of comparative quiet existed in Nicaragua under a series of Conservative presidents until 1893, when José Santos Zelaya, a Liberal, seized the power as a result of a revolution and ruled Nicaragua until 1909. There were various attempts at revolution, but none succeeded until that of 1909. The United States broke off diplomatic relations with Zelaya as a result of the Cannon-Groce executions, describing the Zelaya regime as a "blot on the history" of Nicaragua. The U.S. cruiser "Des Moines" prevented fighting at Bluefields on Dec. 18, 1909, thus making defeat of the Conservative revolutionists impossible, and inaugurating what is now known as the intervention of the United States against Zelaya and the Liberals who backed him. On Dec. 23, the Conservatives defeated the Zelaya troops at Rama, capturing most of the army, and on the following day Zelaya took refuge aboard a Mexican gunboat at Corinto and left the country. José Madriz, a Liberal, took the reins of government, but the United States refused recognition; he was succeeded by Juan J. Estrada, an artisan, who had some Conservative and some Liberal backing and was regarded as a neutral. The United States accorded his government recognition, but it was short-lived.

Adolfo Díaz was elected provisional president in 1910. He was elected a second time in 1913, retiring in 1916; he was again chosen provisional president by vote of the senate in 1927. Under President Díaz, in 1912, the U.S. marines were invited into Nicaragua on the plea of their need to protect foreign lives and property during the so-called Mena revolution, and the legation guard which succeeded the 1912 expeditionary force remained until 1925, and unquestionably preserved peace and gave Nicaragua the period of rest and recuperation which was marked by its prosperity.

(*See* CENTRAL AMERICA.)

President Díaz was succeeded by Emiliano Chamorro in 1916, and he in turn by his nephew, Diego M. Chamorro (1920–23), who died in office and was succeeded by Bartolo Martínez, vice-president. The election of 1924, under laws framed by a U.S. expert but without the U.S. supervision that had been planned, resulted in the election of a coalition ticket, Pres. Carlos Solórzano being an anti-Chamorro Conservative, and Juan B. Sacasa, vice-president, being the leader of the Liberals. Gen. Emiliano Chamorro, who stood again for the presidency as a Conservative, was defeated, and on Oct. 24, 1925, he led a coup d'état which captured the Loma, the fortified hill overlooking Managua, and forced the resignation and departure first of Vice-President Sacasa and next of President Solórzano. Gen. Chamorro was named designate for the presidency by the senate, which had been changed in political complexion through the support of the Chamorro charges of fraud in the previous election (although previously these claims had been disallowed).

Sacasa was declared to have given up his rights by his departure from the country and General Chamorro assumed the presidency. The United States refused recognition, as did other Central American and European governments. Sacasa, meanwhile, had pressed Washington for his own recognition as the legitimate president, but this was refused on the ground that he was not in his country or in possession of the power. He left Washington and went to Mexico, where he had been recognized and where Pres. Plutarco Elias Calles furnished him with arms, ammunition and men.

The appearance of the Mexican element in the situation greatly disturbed Washington, and while before the attitude had been one of neutrality, the United States immediately moved to outwit the Mexican smuggling of arms, to isolate the fighting (the Sacasa forces had formed their bases on both the Caribbean and Pacific coasts) and to bring the revolution to an end with the elimination of Sacasa.

This policy of isolating the fighting and of landing marines to protect foreign interests in the country resulted in weakening the Liberal offensive and also in the resignation of General Chamorro. The Nicaraguan senate, reorganized with alternates or with original members in their seats, thereupon elected Adolfo Díaz designate and thus automatically president. An outcry arose throughout Latin America that the appointment had been forced by the United States. To allay such feelings Col. Henry L. Stimson was sent as a personal representative of Pres. Calvin Coolidge to Nicaragua where he soon arranged an armistice between the warring elements pending an early election, which should be held under U.S. supervision. The Liberals, with the exception of a band of *insurrectos* under Gen. Augusto Sandino, laid down their arms peaceably. The vote was taken on Nov. 4, 1928, and resulted in an overwhelming victory for Gen. José M. Moncada, who had been leader of the Liberal army at the time of Stimson's visit.

The United States soon afterward began the gradual withdrawal of its troops as rapidly as their place could be taken by a local national guard. Guerrilla warfare continued between government forces and General Sandino's rebels.

The presidential election of 1932 was likewise held under United States supervision, and Sacasa was elected. On Feb. 3, 1933, the new government signed a peace pact with Sandino, who agreed that his followers, except 100, should be disarmed, receiving in return amnesty and land. A year later, Sandino visited the president at Managua, and shortly after leaving the presidential palace was shot down in cold blood by members of the national guard. Charges that the assassination was by direct order of the minister of war, Gen. Anastasio Somoza, were vigorously denied.

Unsatisfactory economic conditions and personal friction between President Sacasa and members of the government brought his forced resignation in June 1936, and Carlos Jarquín became provisional president. The regular presidential elections in November of that year resulted in the choice of General Somoza as the republic's chief executive. Somoza, who had been left in command of the national guard when the U.S. marines were withdrawn in 1933, remained to dominate Nicaraguan politics and government for more than a decade, and his administrations became increasingly authoritarian in nature. He first took office in Jan. 1937 and began a vigorous policy, placing special emphasis on public works. The already unsatisfactory condition of the world market for coffee, Nicaragua's most important product, was made acute by Brazilian abandonment of its control of coffee exports and prices. Nicaraguan finances suffered seriously, but under the firm hand of President Somoza, order and stability were maintained. The long-standing boundary dispute with Honduras flared up earlier in the same year, but efforts of several American republics succeeded in easing the tension.

Under President Somoza's leadership, Nicaraguan foreign policy followed closely the lead of the United States. At the outbreak of World War II in 1939, Nicaragua proclaimed neutrality and co-operated with the United States in policies designed to defend the western hemisphere. After the attack on Pearl Harbor in Dec. 1941, Nicaragua declared war against Japan, Germany and Italy; and in 1945 the republic became one of the original members of the United Nations organization. In that body, especially after 1947, Nicaraguan delegations generally supported the United States in measures affecting its "cold war" with the Soviet Union.

With respect to domestic politics, Somoza retained firm control of the government of Nicaragua. He relied upon *continuismo*, a political technique common to a number of the Central American states, to retain power despite constitutional limitations on the presidential term of office. Thus Somoza, inaugurated in Jan. 1937, acquired a new eight-year term with the adoption of the constitution of 1939. That document prohibited the immediate re-election of the president, but an amendment adopted in 1943 permitted exception in Somoza's case.

A presidential election held in Feb. 1947 resulted in the choice of Leonardo Argüello as president. Argüello, thought to be faithful to Somoza, exhibited signs of political independence almost immediately after taking office on May 1. He was deposed on May 25 in a coup d'état led by former President Somoza.

Benjamín Lacayo Sacasa, more acceptable to Somoza, thereupon became acting president on an interim basis, and was replaced on Aug. 15 by Pres. Víctor M. Román y Reyes. The latter, faithful to Somoza, died in office in May 1950. At that time Somoza resumed the presidency on a theoretically provisional basis, and on May 1, 1951, he was inaugurated for a new six-year term.

Population.—The 1950 census of the Americas assigned to Nicaragua a population of 1,053,189. The principal cities and their 1950 populations are: Managua, 107,444; León, 31,008; Matagalpa, 10,362; and Granada, 21,743. An overwhelming majority of the population of the country is *mestizo*. Some Negroes live on the Caribbean coast.

Political Organization.—The constitution of 1950 superseded those of 1939, 1911, 1905 and 1894. It vested the executive authority in the president of the republic, theoretically elected by a popular vote for a six-year term and ineligible for immediate re-election. The president must be a native Nicaraguan at least 30 years of age. The constitution provided for a cabinet (heads of the various national government departments) appointed by the president.

Legislative power is vested in a bicameral congress. The senate is composed of one member for each of the 15 departments into which the republic is divided, plus all of the country's living former presidents. The former are elected for six-year terms while the latter have life tenure in the senate. The lower chamber, called the house of deputies, is made up of 40 members. This figure is arrived at through arbitrary assignment of a given number of deputies for each of the 15 departments, after which one deputy is added for every 30,000 inhabitants. The deputies are elected for six-year terms. Congress convenes annually on April 15 for a 60-day regular session; additional special sessions can be called by the president of the republic when he deems them necessary.

Nicaragua is a unitary, or centralized, republic. The 15 primary political divisions are called departments. Each is governed through a political chief and a police chief, both appointed by the president of the nation.

The judiciary consists of the supreme court of justice and a superior judge of labour at Managua; 5 courts of appeal, located respectively at León, Granada, Matagalpa, Bluefields (also known as El Bluff) and Masaya; and about 150 lower courts. Elected by congress, the members of the supreme court of justice and the superior judge of labour have six-year terms, and the judges of the courts of appeal 4-year periods in office.

Education and Religion.—The educational system is highly centralized under the minister of public instruction, and primary education is free and theoretically compulsory. In 1949 there were 1,302 primary schools with 2,918 teachers and 89,991 pupils; 78 secondary schools with 556 teachers and 10,891 students; and two universities—at Granada and León—with 620 students. The two universities were merged in 1951. In the 1949 budget, the equivalent of $1,552,878 was set aside for education.

Roman Catholicism is the principal religion, but all are tolerated. Managua is the seat of an archdiocese which embraces the dioceses of Granada, León, and Matagalpa. Pres. Anastasio Somoza re-established religious instruction in the schools, reversing a quarter-century policy.

Finance.—In 1925, the córdoba was made the monetary unit. It was initially on a parity with the U.S. dollar, but declined until, on June 8, 1938, it was officially pegged at the rate of five córdobas per dollar and thereafter was controlled at that rate. A gold reserve of 9,413.2057 fine ounces was set up at New York city. In 1948, Nicaragua's internal public debt came to 28,873,741.22 córdobas, while the recognized external debt was figured at 17,276,355.60 córdobas.

Defense.—Nicaragua was virtually without an army from 1912, when U.S. marines were first landed, until 1933, when they departed. During this period, the marines furnished ample defense to the government. A small guard was maintained at the capital, largely for parade purposes. When the U.S. troops were withdrawn in 1933, they left Nicaragua with a national guard, which had been organized and trained by the marines.

Economics and Trade.—Nicaraguan prosperity depends primarily upon the country's coffee crop and the world price of coffee. This commodity constitutes from 25% to 30% of the republic's exports and provides a livelihood for more than half the population. In 1951 the country exported 262,578 60-kg. bags of coffee, of which 94.5% was shipped to the United States. Other major Nicaraguan exports include bananas, gold, cotton, lumber, hides and skins, sugar, ipecacuanha root and cacao. The United States

Value of Nicaraguan Foreign Trade
(In U.S. dollars)

	1939	1944	1948	1951
Imports	6,365,000	10,151,000	24,134,000	30,000,000
Exports.	8,301,000	15,412,000	26,683,000	41,000,000

purchases the bulk of the exports of Nicaragua and is the principal supplier of her imports. The latter include textiles, especially cotton, machinery and apparatus and miscellaneous manufactured goods and foodstuffs.

Communications.—Nicaragua's principal ports are Corinto (*q.v.*), San Juan del Sur, on the Pacific coast, Bluefields (*q.v.*) or El Bluff, and Puerto Cabezas, on the Caribbean, with San Juan del Norte of lesser importance. Communications within the country are limited. River transportation is significant, especially on the San Juan river. The National railroad from Corinto on the Pacific coast runs through León, Managua, Masaya and Granada to Diriamba.

(L. W. BE.; G. I. B.)

NICASTRO, a town and episcopal see of Calabria, Italy, in the province of Catanzaro, 17 mi. W.N.W. of it by rail, and 5½ mi. E. of S. Eufemia, a station on the line along the west coast from Naples to Reggio di Calabria. Pop. (1936) 16,273 (town), 24,998 (commune). It is on the isthmus between the gulfs of S. Eufemia and of Squillace, the narrowest part of Calabria, 970 ft. above sea-level, and commands a fine view. Frederick II's son Henry was imprisoned in the castle. The place suffered greatly from the earthquake of 1638, which also destroyed the Benedictine abbey of S. Eufemia, founded by Robert Guiscard.

NICCOLI, NICCOLO DE' (1363–1437), Italian humanist, was born and died at Florence. He was one of the chief figures in the company of learned men which gathered round Cosimo de' Medici. Niccoli's chief services to classical literature consisted in his work as a copyist and collator of ancient mss. Many of the most valuable mss. in the Laurentian library are by his hand, amongst them those of Lucretius and of 12 comedies of Plautus. Niccoli's private library was the largest and best in Florence; he also possessed a small but valuable collection of ancient works of art, coins and medals. He regarded himself as an infallible critic, and could not bear the slightest contradiction.

See the *Life* in *Traversarii Epistolae* (ed. L. Mehus, 1759); G. Voigt, *Die Wiederbelebung des klassischen Altertums* (1893); G. Zippel, *Nicolò Niccoli* (Florence, 1890).

NICCOLITE, a mineral consisting of nickel arsenide, NiAs, containing 43.9% nickel. Crystals are hexagonal, but are rare and indistinct. It usually occurs as compact masses of a pale copper-red colour, with metallic lustre on the uneven fractured surfaces. It is opaque and brittle, and the streak is brownish-black. The specific gravity is 7.5 and the hardness 5½. Niccolite occurs with ores of cobalt, silver and copper at Annaberg and Schneeberg in Saxony, at Sangerhausen and Mansfeld in Prussian Saxony and other localities.

NICE, a city of France, the chief town of the department of the Alpes Maritimes, and previous to 1860 the capital of the county of Nice (Nizza) in the kingdom of Sardinia, 739 mi. by rail from Paris. Pop. (1946) 211,165. The population fluctuates with the seasons, owing to the influx of winter visitors.

The town is situated at the mouth of the Paillon (Paglione), at the northern end of the Baie des Anges. The historical nucleus of the town is an isolated limestone hill, running back for some distance from the shore and formerly crowned by a castle. Towards its south-west corner stands a tower (Tour Bellanda or Clérissy) dating, it is said, from the 5th century. The old town stretches along the western base of the hill; the "town of the 18th century" on ground farther west slopes gently towards the Paillon; and to the north-east and north and west beyond the stream lies the modern city. To the east of the hill the commercial quarter surrounds the port. The whole frontage of Nice is composed of fine embankments, notably the Promenade des Anglais begun 1822–24 at the cost of the English colony, and the course of the Paillon also is embanked on both sides. Nice has a Roman Catholic cathedral—Ste. Réparate, dating from 1650—two Russian churches, two synagogues and an Anglican chapel. Architecturally the most remarkable church is Notre Dame du Voeu, a modern Gothic building. The lycée was founded by the Jesuits in the 17th century. There is an astronomical and meteorological observatory on Mont Gros (1,220 ft.). The city is famous for its carnival festivities, especially the "battle of flowers."

Industry and Trade.—The industrial establishments are perfumery factories, distilleries, oil-works, furniture and woodwork factories, confectionery works, soap-works, factories for silk goods, straw hats, rubber goods, pianolas, metal goods and a national tobacco factory. Besides the vine, the trees principally cultivated in the neighbourhood are the olive, the orange, the mulberry and the carob; and the staple exports are oil, agricultural produce, fruits and flowers. Nice now joins on the north-east the ancient episcopal town of Cimiez, where are the most luxurious hotels. Reckoning from east to west the town is surrounded by a girdle of beautiful towns—Carabacel, St. Etienne, St. Philippe and Les Beaumettes. On the east of the port lie Montboron, Riquier and St. Roch, the last partly occupied by barracks. The entrances to the port of Nice and the outer pier have been improved; that of the outer port is 300 ft. wide, and that of the inner 220 ft. The area of the harbour is about 8 ac.; vessels drawing more than 23 ft. cannot enter; its trade is mostly coastal, principally in French and Italian vessels. Nice is an episcopal see (first mentioned at the end of the 4th century) under the archbishop of Aix. It belongs to the XV military division (Marseilles). It is the seat of a prefect, of tribunals of first instance and of commerce and of a board of trade arbitrators. The coastal railway is the main line of communication; an extension of the branch line up the Paillon valley to l'Ecarène joining the Ventimiglio-Coni (Cuneo) line at Breil was opened on Oct. 30, 1928.

Climate.—Protected towards the north by hills which rise stage behind stage to the main ridge of the Alps, Nice is celebrated for the mildness of its climate. The mean temperature is 60°, that of winter being 49°, of spring 56°, of summer 72° and of autumn 63°. For a few nights in winter there is frost, but snow is practically unknown. The highest reading of the thermometer is rarely above 90°. There are 67 days with rain in the course of a year; but it usually falls in heavy showers which soon leave the sky clear again; the whole annual amount exceeds 32 in. Fine

THE GARDEN OF KING ALBERT I IN NICE

days and rainy days are almost equally distributed throughout the different seasons. The winds are very variable, sometimes changing several times a day, but the most frequent is the east wind. April and May are the most windy months. The south-west wind (called *Libeccio,* or wind of Libya) is moist and warm; the north-east (or *Gregaou,* Greek), which is rare, brings storms of hail and even snow in winter. The mistral (from the north-west) and the tramontane (from the north) are generally stopped by the mountains. The climate of Nice, combining sea and sun, is suitable for convalescents, especially after acute affections of the lungs or surgical operations. Sufferers from the effects of paralysis or in the chronic stages of the rheumatic disorders are said to find its moderately warm character particularly soothing. Autumn is the best season. Patients with heart disease may find the summer heat trying.

History.—Nice (*Nicaea*) was founded about two thousand years ago by the Phocaeans of Marseilles, and was named in honour of a victory (*νίκη*) over the neighbouring Ligurians. It soon became a busy trading station, but had a rival in the town of Cemenelum, in existence till the time of the Lombard invasions, which has left its ruins at Cimiez. In the 7th century Nice joined the Genoese league formed by the towns of Liguria. In 729 it repulsed the Saracens; but in 859 and 880 they pillaged and burned it, and for the most of the 10th century remained masters of the surrounding country. As an ally of Pisa, Nice was the enemy of Genoa, and both the king of France and the emperor endeavoured to subjugate it; but it maintained its liberties. In the course of the 13th and 14th centuries it fell more than once into the hands of the counts of Provence; and at length in 1388 it placed itself under the protection of the counts of Savoy. The maritime strength of Nice rapidly increased till it was able to cope with the Barbary pirates; the fortifications were largely extended and the roads to the city improved. During the struggle between Francis I and Charles V great damage was caused by the passage of the armies invading Provence; pestilence and famine raged in the city for several years. In 1543 Nice was attacked by the united forces of Francis I and Barbarossa; and the inhabitants were ultimately compelled to surrender, and Barbarossa was allowed to pillage the city and to carry off 2,500 captives. Pestilence appeared again in 1550 and 1580. In 1600 Nice was taken by the duke of Guise.

By opening the ports of the countship to all nations, and proclaiming full freedom of trade, Charles Emmanuel in 1626 gave a great stimulus to the city. Captured by Catinat in 1691, Nice was restored to Savoy in 1696, but it was again besieged by the French in 1705, and in 1706 its citadel and ramparts were demolished. The treaty of Utrecht in 1713 gave the city back to Savoy; and in the peaceful years which followed the "new town" was built. From 1744 till the peace of Aix-la-Chapelle (1748) the French and Spaniards were again in possession. In 1775 the king of Sardinia destroyed all that remained of the ancient liberties of the commune. Conquered in 1792 by the armies of the French Republic, the county of Nice continued to be part of France till 1814; but after that date it reverted to Sardinia. By a treaty concluded in 1860 between the Sardinian king and Napoleon III it was again transferred to France.

NICEPHORUS, the name of three emperors of the East.

Nicephorus I., emperor 802–811, was a native of Seleucia in Pisidia, who was raised by the empress Irene to the office of *logothetes.* With the help of the patricians and eunuchs he contrived to dethrone Irene, and to be elected emperor. His sovereignty was endangered by the revolt of his general Bardanes. But Nicephorus achieved the submission of Bardanes, who was relegated to a monastery. A conspiracy headed by the patrician Arsaber had a similar issue. Nicephorus set himself with great energy to increase the empire's revenue. By his rigorous imposts he alienated the favour of his subjects, and especially of the clergy. In 803 and 810 he made a treaty with Charlemagne, by which the limits of the two empires were amicably fixed. Venice, Istria, the Dalmatian coast and South Italy were assigned to the East, while Rome, Ravenna and the Pentapolis were included in the Western realm. By withholding the tribute which Irene had agreed to pay to Harun al-Rashid, Nicephorus committed himself to a war with the Saracens. Compelled by Bardanes's disloyalty to take the field himself, he sustained a severe defeat at Crasus in Phrygia (805), and only obtained peace on condition of paying a yearly contribution of 30,000 gold pieces. By the death of Harun in 809, Nicephorus was left free to deal with the Bulgarian king, Krum, who was harassing his northern frontiers. In 811 Nicephorus invaded Bulgaria and drove Krum to ask for terms, but in a night attack he allowed himself to be surprised and was slain along with a large portion of his army.

See Gibbon, ed. Bury (1911) vol. v., p. 204–205, Bury's *Eastern Roman Empire.*

Nicephorus II. (Phocas), emperor 963–969, belonged to a Cappadocian family which had produced several distinguished generals. He was born about 912, joined the army at an early age, and, under Constantine VII., became commander on the eastern frontier. In the war with the Saracens he began with a severe defeat (956), which he retrieved in the years following by victories in Syria. In 960 he led an expedition to Crete, and wrested the whole island from the Saracens. He then returned to the east with a large and well-equipped army. In the campaigns of 962–963 he forced his way through Cilicia to Syria and captured Aleppo, but made no permanent conquests. Upon the death of Romanus II., Nicephorus was proclaimed emperor by the eastern troops, and was eventually acknowledged at Constantinople as colleague of the infant sons of Romanus. In 964–966 he definitely conquered Cilicia and again overran Mesopotamia and Syria, while the patrician Nicetas recovered Cyprus. In 968 he reduced most of the fortresses in Syria, and after the fall of Antioch and Aleppo (969), which were recaptured by his lieutenants, secured his conquests by a peace. On his northern frontier he began a war against the Bulgarians, to whom the Byzantines had of late been paying tribute (967), and by instigating an attack from the Russians distracted their attention effectively. Nicephorus was less successful in his western wars. After renouncing his tribute to the Fatimite caliphs, he sent an expedition to Sicily under Nicetas (964–965), but was forced by defeats on land and sea to evacuate that island completely. In 967 he made peace with the Saracens of Kairawan and turned to defend himself against their common enemy, Otto I. of Germany, who had attacked the Byzantine possessions in Italy; but after some initial successes his generals were defeated and driven back upon the southern coast. Owing to the care which he lavished upon the proper maintenance of the army, Nicephorus was compelled to exercise rigid economy in other departments. By his heavy imposts and the debasement of the coinage he forfeited his popularity with the rest of the community, and gave rise to riots. He was finally assassinated in his sleeping apartment by his nephew and successor John Zimisces. Nicephorus was the author of an extant treatise on military tactics.

Nicephorus III. (Botaniates), emperor 1078–1081, rose to be commander of the troops in Asia. He revolted in 1078 from Michael VII., and with the connivance of the Turks assumed the purple. In face of another rebellious general, Nicephorus Bryennius, his election was ratified by the aristocracy and clergy. With the help of Alexius Comnenus he drove out of the field Bryennius and other rivals, but failed to clear the invading Turks out of Asia Minor. Nicephorus ultimately quarrelled with Alexius, and was banished to a monastery.

See Gibbon, *Decline and Fall* (ed. Bury, 1911); Finlay, *Hist. of Greece;* G. Schlumberger, *Nicéphore Phocas* (Paris, 1890); K. Leonardt, *Kaiser Nicephorus II.* (Halle, 1887).

NICEPHORUS PATRIARCHA (*c.* 758–829), Byzantine historian and patriarch of Constantinople (806–815). He was like his father Theodorus, a zealous opponent of Iconoclasm. He was secretary to the imperial commissaries at the council of Nicaea in 787, which witnessed the triumph of his opinions; but, feeling dissatisfied with court life, he retired into a convent. In 806 he suddenly succeeded Tarasius as patriarch of Constantinople, but was deposed by the Iconoclast Leo V. in 815 and died in exile 829. After his death he was included among the saints of the Orthodox Church.

Nicephorus is the author of two important works on the iconoclastic questions: the *Apologeticus Maior* (817) and the *Apologeticus Minor;* his historical works are two: the *Chronologia Compendiaria,* a table of dates from Adam to the year of his own death; the *Breviarium Historicum,* a history of the years 602–799—a very poor composition, only valuable owing to the paucity of other materials. Editions: Complete, J. P. Migne, *Patrologia Graeca,* vol. c. Theological: A Mai, *Nova Patrum Bibliotheca* i., ii. and iii. Historical: de Boor Teubner, 1880. *See* also Krumbacher, *Geschichte der byzantinischen Litteratur* (1897) and A. Burckhardt in *Byzantinische Zeitschrift* 5. p. 465.

NICHOLAS, ST., bishop of Myra, in Lycia, a saint honoured by the Greeks and the Latins on the 6th of December. His cult is as celebrated as his history is obscure. He was bishop of Myra in the time of the emperor Diocletian, was persecuted, tortured for the faith, and kept in prison until the more tolerant reign of Constantine, and is said to have been present at the council of Nicaea, though Athanasius, who knew all the notable bishops of the period, never mentions Nicholas, bishop of Myra. The oldest known monument of the cult of St. Nicholas seems to be the church of SS. Priscus and Nicholas built at Constantinople by the emperor Justinian. (*See* Procopius, *De aedif.* i. 6.) In the West, the name of St. Nicholas appears in the 9th century martyrologies, and churches dedicated to him are to be found at the beginning of the 11th century. It is more especially, however, from the time of the removal of his body to Bari, in Apulia, that his cult became popular. The inhabitants of Bari organized an expedition, seized his remains by means of a ruse, and transported them to Bari, where they were received in triumph on May 9, 1087, and where the foundations were laid of a new basilica in his honour. This was the origin of a famous and still popular pilgrimage. There are nearly 400 churches in England dedicated to St. Nicholas. He is the patron saint of Russia; the special protector of children, scholars, merchants and sailors; and is invoked by travellers against robbers. In art St. Nicholas is represented with various attributes, being most commonly depicted with three children standing in a tub by his side.

A legend of his surreptitious bestowal of dowries upon the three daughters of an impoverished citizen, who, unable to procure fit marriages for them, was on the point of giving them up to a life of shame, is said to have originated the old custom of giving presents in secret on the Eve of St. Nicholas, subsequently transferred to Christmas Day. Hence the association of Christmas with "Santa Claus," an American corruption of the Dutch form "San Nicolaas," the custom being brought to America by the early Dutch colonists. (For the ceremony of the boy-bishop elected on St. Nicholas's Day *see* BOY-BISHOP.)

Nicola di Bari* (Bari, 1901); Charles Cahier, *Caractéristiques des saints* (Paris, 1867), p. 354; Frances Arnold-Forster, *Studies in Church Dedications* (London, 1899), i. 495–501 and iii. 21; L'abbé Marin, *Saint Nicholas, évêque de Myre* (1917).

NICHOLAS I., sometimes called The Great, and certainly the most commanding figure in the series of popes between Gregory I. and Gregory VII., succeeded Benedict III. in April 858. According to the annalist Prudentius of Troyes, "he owed his election less to the choice of the clergy than to the presence and favour of the emperor Louis II. and his nobles"—who can hardly have foreseen with what ability and persistency the rights of the Holy See as supreme arbiter of Christendom were to be asserted even against themselves by the man of their choice. Of the previous history of Nicholas nothing is recorded. His pontificate of nine years and a half was marked by at least three memorable contests which have left their mark in history. The first was that in which he supported the claims of the unjustly degraded patriarch of Constantinople, Ignatius (*q.v.*); but two of its incidents, the excommunication of Photius (*q.v.*), the rival of Ignatius, by the pope in 863, and the counter-deposition of Nicholas by Photius in 867, were steps of serious moment towards the permanent separation between the Eastern and the Western Church.

The second great struggle was that with Lothair (*q.v.*) the king of Lorraine (second son of the emperor Lothair I., and brother of the emperor Louis II.), about the divorce of his wife Theutberga or Thietberga. The pope not only quashed the whole proceedings against Theutberga, but excommunicated and deposed bishops Gunther and Thietgaud, who had been audacious enough to bring to Rome in person the "libellus" of the synod which had given judgment. The archbishops appealed to Louis II., then at Benevento, to obtain the withdrawal of their sentence by force; but, although he actually occupied the Leonine city (864), he was unsuccessful in obtaining any concession, and had to withdraw to Ravenna.

The third great ecclesiastical cause which marks this pontificate was that in which the right of bishops to appeal to Rome against their metropolitans was maintained in the case of Rothad of Soissons, deposed by Hincmar of Reims. In the course of the controversy with the great and powerful Neustrian archbishop papal recognition was first given (in 865) to the False Decretals, which had probably been brought by Rothad to Rome in the preceding year. (*See* DECRETALS.) Nicholas was the pope to whom Boris, the newly converted king of Bulgaria, addressed himself for practical advice in some of the difficult moral and social problems arising out of the transition from heathenism to Christianity. The pope's letter in reply to the hundred and six questions and petitions of the barbarian king is perhaps the most interesting literary relic of Nicholas I. now extant. He died on Nov. 13, 867, and was succeeded by Adrian II.

The *epistolae* of Nicholas I. are printed in Migne, *Patrologia Lat.* vol. 119, p. 769 *seq. See* F. Gregorovius, *Rome in the Middle Ages,* vol. iii. (Eng. trans., London, 1900–1902); H. Lämmer, *Nikolaus I. und die byzantinische Staatskirche seiner Zeit* (Berlin, 1857); J. Roy, *Saint-Nicolas I.* (Paris, 1900); J. Richterich, *Papst Nikolaus I.* (Bern, 1903); A. Greinacher, *Die Anschauungen des Papstes Nikolaus I. über das Verhältnis von Staat und Kirche* (1909).

NICHOLAS II., pope from December 1058 to July 1061, was a Burgundian named Gerard, who at the time of his election was bishop of Florence. He was set up by Hildebrand, with the support of the empress-regent Agnes and of the powerful Duke Godfrey of Lorraine, against Benedict X., the nominee of the Roman nobles, and was crowned at Rome, after the expulsion of Benedict, on Jan. 24, 1059. He continued the policy of ecclesiastical reform associated with the name of Hildebrand (afterwards Gregory VII.). He entered into relation with the Normans, now firmly established in southern Italy, and the new alliance was cemented at Melfi, where Nicholas II., invested (1059) Robert Guiscard with the duchies of Apulia, Calabria and Sicily, and Richard of Aversa with the principality of Capua, in return for fealty and the promise of assistance. The first fruits of this arrangement, based on no firmer foundation than the forged "Donation of Constantine" (*q.v.*), but destined to make the papacy more independent in both the Eastern and Western Empires, was the reduction in the autumn, with Norman aid, of Galera, where the anti-pope had taken refuge, and the end of the subordination of the papacy to the Roman nobles.

Meanwhile Nicholas had sent legates to Milan to adjust the difference between the Patarenes and the archbishop and clergy. Archbishop Wido, in face of the ruinous conflict in the Church of Milan, was forced to submit to the terms proposed by the legates, involving the subordination of Milan to Rome; the new relation was advertised by the unwilling attendance of Wido and the other Milanese bishops at the council summoned to the Lateran palace in April 1059. This council continued the Hildebrandine reforms by sharpening the discipline of the clergy, and regulated future elections to the Holy See. (*See* LATERAN COUNCILS, and CONCLAVE.) The emperor's traditional rights in the matter of papal elections were completely ignored. Stephen, cardinal priest of S. Chrysogonus, was sent to the German court to attempt to allay the consequent ill-feeling, but was not received. Pope Nicholas, moreover, had offended the German bishops by what they regarded as arbitrary interference with their rights; they retaliated, in a synod held early in 1061, by declaring the new electoral law annulled, and the pope himself deposed. But party strife in Germany enabled the pope to ignore these proceedings. Nicholas II. died at Florence in July 1061.

His *Diplomata, epistolae, decreta* are in Migne, *Patrolog.* Lat. 143, pp. 1301–1366. *See* the article "Nikolaus II." by C. Mirbt in Herzog-

Hauck, *Realencyklopädie* (3rd ed., Leipzig, 1904), with bibliography. Other lists of authorities are in Potthast, *Biblioth. Hist. Med. Aev.* (2nd ed., Berlin, 1896), p. 854; and Ulysse Chevalier, *Répertoire des sources hist. biobibliogr.* (Paris, 1905), vol. 3347, *s.v.* "Nicolas II."

NICHOLAS III. (Giovanni Gaetano Orsini), pope from Nov. 25, 1277 to the 22nd of August 1280, was a Roman nobleman who had served under eight popes. He succeeded John XXI., largely through family influence, after a six-months' vacancy in the Holy See. A born politician, he concluded a concordat with Rudolph of Habsburg in May 1278, by which the Romagna and the exarchate of Ravenna were guaranteed to the pope; and in July he issued an epoch-making constitution for the government of Rome, which forbade foreigners taking civil office. Nicholas issued the bull *Exiit* on Aug. 14, 1279, to settle the strife within the Franciscan order between the parties of strict and loose observance. He repaired the Lateran and the Vatican at enormous cost. Nicholas brought just reproach on himself by his nepotism. *See* also the *Catholic Encyclopaedia* (*s.v.*).

Roman.* vol. 2 (Berlin, 1875); A. Demski, "Papst Nikolaus III.," in *Kirchengeschichtliche Studien* (Münster, 1903); F. Gregorovius, *Rome in the Middle Ages*, vol. 5, trans. by Mrs. G. W. Hamilton (London, 1900–1902); Fr. Wertsch. *Die Beziehungen Rudolfs von Habsburg zur röm. Kurie bis zum Tode Nikolaus III.* (Bochum, 1880); G. Palmieri, *Introiti ed esiti di Papa Niccolò III.* (Rome, 1889).

NICHOLAS IV. (Girolamo Masci), pope from Feb. 22, 1288, to April 4, 1292, a native of Ascoli and a Franciscan monk, succeeded St. Bonaventura as general of his order in 1274, was made cardinal-priest of Sta. Prassede and Latin patriarch of Constantinople by Nicholas III., cardinal-bishop of Palestrina by Martin IV., and succeeded Honorius IV. after a ten-months' vacancy in the papacy. He was a pious, peace-loving monk with no ambition save for the church, the crusades and the extirpation of heresy. He steered a middle course between the factions at Rome, and sought a settlement of the Sicilian question. In May 1289 he crowned Charles II. king of Naples and Sicily after the latter had expressly recognized papal suzerainty, and in February 1291 concluded a treaty with Alphonso III. of Aragon and Philip IV. of France looking toward the expulsion of James of Aragon from Sicily. The loss of Ptolemais in 1291 stirred the pope to renewed enthusiasm for a crusade. He sent the celebrated Franciscan missionary, John of Monte Corvino (*see* MONTE CORVINO, GIOVANNI DI), with some companions to labour among the Tatars and Chinese. He issued an important constitution on July 18, 1289, which granted to the cardinals one-half of all income accruing to the Roman see and a share in the financial management, and thereby paved the way for that independence of the college of cardinals which, in the following century, was to be of detriment to the papacy. Nicholas was succeeded by Celestine V.

NICHOLAS V. (Tomaso Parentucelli or Tomaso da Sarzana), pope from March 6, 1447, to March 24, 1455, was born at Sarzana, where his father was a physician, in 1398. In 1444 he was made bishop of Bologna by Pope Eugenius IV., who sent him to Frankfort to negotiate an understanding between the Holy See and the empire with regard to the reforming decrees of the council of Basel. On his return to Rome, he was made cardinal priest of Sta. Susanna (December 1446). He was elected pope in succession to Eugenius IV. on March 6, 1447.

With the German king, Frederick III., he made the Concordat of Vienna, or Aschaffenburg (Feb. 17, 1448), by which the decrees of the council of Basel against papal annates and reservations were abrogated so far as Germany was concerned; and in the following year he secured a still greater triumph when the resignation of the anti-pope Felix V. (April 7), and his own recognition by the rump of the council of Basel, assembled at Lausanne, put an end to the papal schism. The next year, 1450, Nicholas held a jubilee at Rome. In March 1452 he crowned Frederick III. as emperor in St. Peter's, the last occasion of the coronation of an emperor at Rome. Under the generous patronage of Nicholas humanism made rapid strides. He employed hundreds of copyists and scholars, giving as much as ten thousand *gulden* for a metrical translation of Homer, and founded a library of nine thousand volumes. He restored the walls and numerous churches of Rome and began the rebuilding of the Vatican and St. Peter's.

In 1452 a formidable conspiracy for the overthrow of the papal government, under the leadership of Stefano Porcaro, was discovered and crushed. This revelation of disaffection, together with the fall of Constantinople, darkened the last years of Nicholas; "As Thomas of Sarzana," he said, "I had more happiness in a day than now in a whole year." He died on March 24, 1455.

See Herzog-Hauck, *Realencyklopädie für protestantische Theologie und Kirche*, vol. xiv. (1904), with full references; *Cambridge Modern History*, i. 76–78; and M. Creighton, *History of the Papacy* (London, 1882), vol. ii.

NICHOLAS V. (Pietro Rainalducci), antipope in Italy from 1328 to 1330 during the pontificate of John XXII. at Avignon, a native of Corbara in the Abruzzi, joined the Franciscan order in 1310. He was elected through the influence of the excommunicated emperor, Louis the Bavarian, by an assembly of priests and laymen, and consecrated at St. Peter's on May 12, 1328, by the bishop of Venice. After spending four months in Rome, he withdrew with Louis to Viterbo and thence to Pisa, where he was guarded by the imperial vicar. He was excommunicated by John XXII. in April 1329, and sought refuge with Count Boniface of Donoratico near Piombino. Having obtained assurance of pardon, he presented a confession of his sins first to the archbishop of Pisa, and then (Aug. 25, 1330) to the pope at Avignon. He remained in honourable imprisonment in the papal palace until his death in October 1333.

Christophe, *Histoire de la papauté pendant le XIVième siècle*, vol. 1 (Paris, 1853); E. Marcour, *Anteil der Minoriten am Kampfe zwischen König Ludwig IV. von Bayern und Papst Johann XXII.* (Emmerich, 1874); Eubel, "Der Gegenpapst Nicolaus V. u. seine Hierarchie," in *Hist. Jahrbuch*, vol. 12 (1891).

NICHOLAS I. [NIKOLAI PAVLOVICH], emperor of Russia (1796–1855), eighth child of the emperor Paul I. and his wife Maria Feodorovna, was born at Tsarskoe-Selo on June 25 (July 6, N.S.), 1796. He was only five years old when his father's murder brought his brother Alexander I. to the throne (1801). His education was supervised by M. von Lambsdorff, director of the 1st cadet corps and ex-governor of Courland. But Nicholas and his brother Constantine had little taste for learning. They were interested mainly in military matters.

The grand-duke Nicholas joined the Russian headquarters in France in 1814, but not to take part in any fighting. In 1815 he was with the Allies in Paris, and in the following year set out on the *grand tour*, visiting Moscow and the western provinces of Russia, Berlin (where he was betrothed to Princess Charlotte Louise, daughter of Frederick William III.), and England. His marriage marked the beginning of intimate relations between the courts of Berlin and St. Petersburg. On the 17/29th of April 1818 their first child, the future emperor Alexander II., was born. In the autumn Nicholas was placed in command of the 2nd brigade of the 1st division of the Guard.

Alexander I. died at Taganrog on Dec. 1, 1825. Constantine was at Warsaw; Nicholas was too conscious of his unpopularity in the army—the fruit of his drastic discipline—to dare to assume the crown without a public abdication on the part of the legitimate heir. The result (*see* CONSTANTINE PAVLOVICH) was a three weeks' interregnum, of which the discontented spirits in the army took advantage to bring to a head a plot that had long been

hatching in favour of constitutional reform. When on Dec. 14 the troops who had already taken the oath to Constantine were ordered to take another to Nicholas, it was easy to persuade them that this was a treasonable plot against the true emperor. The Moscow regiment refused to take the oath, and part of it marched, shouting for Constantine and "Constitution," to the square before the Senate House, where they were joined by a company of the Guard and the sailors from the warships. In this crisis Nicholas showed high personal courage, if little decision and initiative. For hours he stood, or sat on horseback, amid the surging crowd, facing the mutinous soldiers—who had loaded their muskets and formed square—while effort after effort was made to bring them to reason, sometimes at the cost of life—as in the case of Count Miloradovich, military governor of St. Petersburg, who was mortally wounded by a pistol shot while arguing with the mutineers. When at last the emperor consented to use force, a few rounds of grapeshot sufficed to quell the mutiny. The chief conspirators—Prince Shchepin-Rostovski, Suthoff, Ryleyev, Prince Sergius Trubetskoi, Prince Obolenski and others—were arrested the same night and interrogated by the emperor in person. A special commission, consisting entirely of officers, was then set up; and before this, for five months, the prisoners were subjected to a rigorous inquisition. The prisoners were kept in solitary confinement in the casemates of the inner fortress of St. Peter and St. Paul. They were brought blindfolded before the commission, and then suddenly confronted with their interrogators. Many went mad under the ordeal, one died, and one starved himself to death (Schiemann, ii. 73). It was soon clear that the Dekabrist (December) rising was but one manifestation of a vast conspiracy permeating the whole army. A military rising on a large scale in the south was only averted by the news of the failure of the mutiny at St. Petersburg; and at Moscow there were many arrests, including that of Colonel Paul Pestel, the chief of the revolutionary southern league. The 121 prisoners were finally brought to trial before a supreme criminal court, established by imperial *ukaz* (June 1–12, 1826). Some were condemned to death, others to solitary confinement in fortresses, others to the Siberian mines and colonies. Of the latter many were accompanied by their wives, though the Russian law allows divorce in the case of such sentences; the emperor unwillingly allowed the devoted women to go, but decreed that any children born to them in Siberia would be illegitimate.

In spite of his reverence for his brother's memory, Nicholas made a clean sweep of "the angel's" Bible Society; as for Alexander's projects of reform, the pitiful legacy of a life of unfulfilled purposes, these were reported upon by committees, and shelved. Nicholas too saw the need for reform; the Dekabrist conspiracy had burnt that into his soul; but he had his own views as to the reform needed. The state was corrupt, disorganized; what was wanted was not more liberty but more discipline. So he put civil servants, professors and students into uniform, and for little offences had them marched to the guard-house; thought was disciplined by the censorship, the army by an unceasing round of parades and inspections. The one great gift of Nicholas I. to Russia, a gift which he really believed would be welcome because it would bring every subject into immediate contact with the throne, was—the secret police, the dreaded Third Section of the Private Chancery of the emperor.

The crowning fault of Nicholas was, however, that he would not delegate his authority; whom could he trust but himself? In this he resembled his contemporary the emperor Francis I. But Francis would "sleep upon" a difficult problem; Nicholas never slept. His constitution was of iron, his capacity for work prodigious; reviews and parades, receptions of deputations, visits to public institutions, then eight or nine hours in his cabinet reading and deciding on reports and despatches—such was his ordinary day's work. Under the "Iron Tsar" the outward semblance of authority was perfectly maintained; but behind this imposing façade the whole structure of the Russian administrative system continued to rot and crumble.

Revelations of the rottenness of the under-structure had, indeed, begun before the outbreak of the war with Turkey in 1828. The newly organized squadron which in 1827 set out on the cruise which ended at Navarino only reached Plymouth with difficulty, and there had to be completely refitted. The disastrous Balkan campaign of 1828 was an even more astounding revelation of corruption, disorganization and folly in high places. The weary and starving soldiers were forced to turn out amid the marshes of the Dobrudscha before the emperor as spick and span as on the parade grounds of St. Petersburg; but he could do nothing to set order in the confusion of the commissariat, which caused the troops to die like flies of dysentery and scurvy; or to remedy the scandals of the hospitals. His presence hampered the initiative of Prince Wittgenstein, the nominal commander-in-chief; for Nicholas was incapable of leaving him a free hand.

These then were the leading principles which underlay Nicholas's domestic and foreign policy from first to last: to discipline Russia, and by means of a disciplined Russia to discipline the world. The mission of Russia in the West was, in accordance with the principles of the Holy Alliance as Nicholas interpreted them, to uphold the cause of legitimacy and autocracy against the Revolution; her mission in the East was, with or without the co-operation of "Europe," to advance the cause of Orthodox Christianity, of which she was the natural protector, at the expense of the decaying Ottoman empire. The sympathy of Europe with the insurgent Greeks gave the tsar his opportunity. The duke of Wellington was sent to St. Petersburg in 1826 to congratulate the new tsar on his accession and arrange a concert in the Eastern Question. The upshot proved the diplomatic value of Nicholas's apparent sincerity of purpose and charm of manner; the "Iron Duke" was to the "Iron Tsar" as soft iron to steel; Great Britain, without efficient guarantees for the future, stood committed to the policy which ended in the destruction of the Ottoman sea-power at Navarino and the march of the Russians on Constantinople. By the treaty of Adrianople in 1829 Turkey seemed to become little better than a vassal state of the tsar, a relation intensified, after the first revolt of Mehemet Ali, by the treaty of Unkiar-Skelessi in 1833. In the West, Nicholas himself proposed an armed intervention of the Alliance "to restore order" in Belgium and France; and when his allies held back even proposed to intervene alone, a project rendered impossible by the outbreak of the great insurrection in Poland, which tied the hands of all three powers.

Then, the insurrection in Poland once crushed, and Poland itself scarce surviving even as a geographical expression, he drew the three eastern autocratic powers together in a new "Holy Alliance" by the secret convention of Berlin (Oct. 3, 1833) reaffirming the right and duty of intervention at the request of a legitimate sovereign. The cordial understanding with Austria, cemented at Münchengrätz and Berlin, was renewed, after the accession of the emperor Ferdinand, at Prague and Töplitz (1835); on the latter occasion it was decided "without difficulty" to suppress the republic of Cracow, as a centre of revolutionary agitation. He allowed himself to be persuaded by Metternich to support the cause of Don Carlos in Spain, and so early as May 1837, in view of the agitation in Hungary, he announced that "in every case" Austria might count on Russia.

These cordial ties were loosened, however, by the fresh crisis in the Eastern Question after 1838. Metternich was anxious to summon a European conference to Vienna, with a view to placing Turkey under a collective guarantee. Nicholas refused to be a party to it. Moreover, as Austria showed an inclination to approach the maritime powers, he determined to come to an agreement with Great Britain, in order to settle the Eastern Question according to his own views; this is the explanation of those concessions in the Eastern Question which ended in the Quadruple Alliance of 1840 and the humiliation of Louis Philippe's government. The new Anglo-Russian *entente* led in 1844 to a visit of the tsar to the English court. (*See* EASTERN QUESTION.)

When the storm of revolution burst over Europe in 1848, Nicholas remained entrenched behind the barriers of his own disciplined empire. But in 1849 he intervened in Hungary, at the entreaty of Francis Joseph, crushed the insurgent Hungarians and handed back their country as a free gift to the Habsburg king. Scarcely less valuable to Austria was the tsar's intervention in the quarrel between Austria and Prussia arising out of the Hesse inci-

dent and the general question of the hegemony of Germany. In October 1850 he had a meeting with Francis Joseph at Warsaw, at which Count Brandenburg and Prince Schwarzenberg were present. Prussia, he declared, must in the German question return to the basis of the treaties of 1815 and renew her *entente* with Austria; this was the only way of preserving the old friendship of Prussia and Russia. In face of the threat conveyed in this, the Prussian government decided to maintain peace (Nov. 2), Radowitz resigning as a protest. Thus Nicholas, who refused to believe in the perfidy ascribed by Frederick William to Austria, was the immediate cause of Prussia's humiliation at Olmütz.

Nicholas was soon to have personal experience of the perfidy of Austria in the troubles that led up to the Crimean War. Gratitude, in the tsar's opinon, should have made her neutral if not friendly. When the dispute arose with Napoleon III. over the guardianship of the Holy Places Nicholas could not believe that Christian powers would resent his claim to protect the Christian subjects of the sultan; he believed he could count on the friendship of Austria and Prussia; as for Great Britain, he would try to come to a frank understanding with her. The disillusionment that followed was profound. In October 1853 Nicholas met his brother monarchs of the triple alliance at Warsaw for the last time. In December, at the conference of Vienna, Austria had already passed over to the enemy. Prussia was wavering, neutral indeed, but joining the other powers in a guarantee of the integrity of Turkey (April 9, 1854), urging the tsar to accept the decisions of the Vienna conference, and on his refusal signing a defensive alliance with Austria (April 20, 1854), which included among the *casus belli* the incorporation in Russia of the banks of the Danube and a Russian march on Constantinople. Thus Nicholas, the pillar of the European alliance, found himself isolated and at war, or potentially at war, with all Europe. The invasion of the Crimea followed, and with it a fresh revelation of the corruption and demoralization of the Russian system. At the outset Nicholas had grimly remarked that "Generals January and February" would prove his best allies. These acted, however, impartially; and if thousands of British and French soldiers perished of cold and disease in the trenches before Sevastopol, the tracks leading from the centre of Russia into the Crimea were marked by the bones of Russian dead. The revelation of his failure broke the spirit of the Iron Tsar, and on March 2, 1855, he threw away the life which a little ordinary care would have saved.

BIBLIOGRAPHY.—All other works on Nicholas I. were more or less superseded by Professor Theodor Schiemann's *Geschichte Russlands unter Kaiser Nikolaus I.*, of which the 1st vol., *Kaiser Alexander I. und die Ergebnisse seiner Lebensarbeit*, was published at Berlin in 1904; the 2nd, carrying the history of Nicholas's reign down to the revolutions of 1830, in 1908. It is based on a large mass of unpublished material, and considerably modifies, *e.g.*, the account of the accession of Nicholas and of the Dekabrist conspiracy given in chapter xiii. of vol. x. of the *Cambridge Modern History*, and tells for the first time the secret history of the Russo-Turkish War of 1828–29. The great *Recueil des traités conclus par la Russie* of T. T. de Martens (St. Petersburg, 1874–1909) contains admirable introductory essays, based on the unpublished Russian archives, and giving much material for the study of Nicholas's character and policy. Many documents are published for the first time in Schiemann's work; some, from the archives of Count Nesselrode, are published in the *Lettres et papiers du Chancelier Comte de Nesselrode*, t. vi. *seq.* For other works *see* bibliographies attached to the chapters on Russia in vol. x. and xi. of the *Cambridge Modern History*. (W. A. P.; X.)

NICHOLAS II. (1868–1918), tsar of Russia, eldest son of Alexander III., was born at St. Petersburg (Leningrad), on May 18, 1868. An English tutor, Mr. Charles Heath, taught him excellent English, and inspired a love of sports and healthy exercise, while a Russian general, Danilovich, supervised his military training, but there was no attempt to provide him with the comprehensive knowledge required from one whom fate had destined to rule an immense empire. The only occasion which was offered to the young tsarevich to acquaint himself with the problems of the world was his journey to the Far East, so abruptly cut short in Kyoto by the sabre cut of a Japanese fanatic.

He wedded Princess Alix of Hesse at the deathbed of his father; at the festival of his coronation more than 3,000 people were crushed to death through the negligence of the officials who had to arrange a distribution of bounties; and during the coronation itself the imperial chain on his breast fell to the ground. Such impressions contributed strongly to inspire him with a mystic resignation, especially unsuitable for a monarch who had to lead the nation through times of great crisis at home and in foreign affairs. Nicholas II. followed in the footsteps of his father, seeking to preserve peace in foreign relations, and continuing in home affairs, though in a much milder form, the policy of centralization and Russification which had characterized the previous reign. His pacific tendencies were shown by his systematic opposition to all bellicose excitement, by his maintaining M. de Giers in the post of minister of foreign affairs, by his offering the post, on the death of that statesman, to M. de Staal, by his restraining France from dangerous adventures, and by initiating the Peace Conference at The Hague. To these ought perhaps to be added the transformation of the Franco-Russian *entente cordiale* into a formal alliance, since the alliance in question might be regarded as favourable to the preservation of the *status quo* in Europe. In the internal administration during the first years of his reign he introduced by his personal influence, and without any great change in the laws, a more humane spirit towards those of his subjects who did not belong by language and tradition to the dominant nationality, and who were not members of the Eastern Orthodox Church; but he disappointed the men of liberal views by giving it to be clearly understood soon after his accession that he had no intention of circumscribing and weakening the autocratic power by constitutional guarantees or parliamentary institutions. In spite, however, of his desire for peace he let his country drift into the disastrous war with Japan; and notwithstanding his sincere attachment to the principles of bureaucratic autocracy, it was he who granted the constitutional reforms which altered the whole political outlook in Russia. (*See* RUSSIA.)

Nicholas II.'s political outlook was dominated by a kind of theocratic or hieratic spirit; he was looking back for inspirations to the ideas and customs of the Muscovite period; he was induced to impersonate the figure of Alexis Mikhailovich, the father of the western reformer Peter the Great; in 1913 the tercentenary of Michail Feodorovich's accession to the throne after the "Great Troubles" was celebrated with much splendour and emphasis. Pilgrimages were performed with great devotion and circumstance.

The courtiers and bureaucrats in the immediate surroundings of the tsar, men like Sipiaguin, Nicolas Maklakov and Sabler, took advantage of these prepossessions in order to keep up a constant hostility against progressive reformers and western adaptations. But the most dangerous representative of mystic reaction was the tsar's consort, the Empress Alexandra Feodorovna. Of German descent on her father's side and of English descent on the side of her mother (Princess Alice, the daughter of Queen Victoria), she had received her education in England, but, on coming to Russia, she surrendered completely to the most extreme form of theocratic exaltation.

While her sister, the widow of the Grand Duke Sergius, killed by a terrorist, had devoted herself to a simple life at the head of a community of hospital nurses, Alexandra Feodorovna, highly strung and hysterical, sought providential guidance in the midst of unbalanced women and false prophets like the French medium Philippe and the famous Rasputin. The latter obtained a hold on her through the hypnotising influence he exercised over her son, the tsarevich Alexis, a boy affected by the rare disease of hereditary haemophilia. But the crafty peasant had contrived to obtain gradually a psychical domination over the empress and her friends which made it possible for him to distribute political favours and to have his say in the most important affairs of state. The empress considered him as the God-sent representative of the Russian nation, of that mass of peasants which, as she was convinced, was the firm mainstay of autocracy in Russia. And in the later years of Nicholas II.'s reign, the years of great trial and danger, Alexandra Feodorovna stepped in more and more often to direct the tsar's choice of his ministers and to prevent him from making concessions to the spirit of the time. For the circumstances which brought Russia into the World War *see* RUSSIA: *History*.

The suspicion that Alexandra Feodorovna was secretly favour-

ing the cause of Germany and revealing military secrets to the Kaiser—a suspicion often expressed abroad and popularly accepted in Russia—is, according to most competent witnesses, devoid of any basis in fact. The empress was intensely patriotic in her own way, opposed to the aggressive policy of the Hohenzollerns, and never advocated a treacherous compromise with the Central Powers. A former lady-in-waiting, Princess Vassiltchikov, who towards the close of 1916 brought the project of such a compromise from Germany, was promptly ordered out of St. Petersburg (Leningrad). Nevertheless, Alexandra Feodorovna proved to be the evil genius of the Russian dynasty, by her blind and obstinate support of reactionary tendencies and of worthless adventurers, at a time when a wise and firm policy of reform was more needed than ever. All the better representatives of the dynasty—the Dowager Empress, the Grand Duke Nicholas Mikhailovich, the Grand Duchess Victoria—warned her of the imminent danger of that régime of fleeting ministerial shadows which set in after the catastrophe of the War Office in 1915.

The emperor remained passive as commander-in-chief at headquarters while the Empress Alexandra spurned all advice with contempt and continued to pull the strings by dismissing men like Sazonov and Palivanov, and appointing timeservers like Sturmer, Protopopov or Galitzin. The assassination of Rasputin did not frighten but enraged her; she erected a kind of shrine over the body of the prophet and sent the Grand Duke Dmitry Pavlovich, who had taken part in the murder, into exile. Her power was broken only by the revolution.

The thread of the Romanov dynasty was cut without much resistance. When in March 1917 the emperor received at headquarters a telegram from the president of the Duma informing him of the events of St. Petersburg and demanding his abdication, and Gutchkov and Shulgin arrived with the act of abdication itself, he submitted with fatalistic composure. He refused to give up his crown to his son with Grand Duke Michael as regent, because he did not wish to trust the boy to the danger of a political storm; and his abdication was made in favour of the Grand Duke Michael, who in his turn refused to accept the crown unless it was tendered to him by the will of the people. The last chance of a régime of constitutional monarchy was cut short. Proposals were made on behalf of the British Government to allow Nicholas II. and his family to take up their abode in England; but the Provisional Government in St. Petersburg did not accede to that plan. Kerensky and Milyukov declared that the imperial family were in safety in Russia. Later on the emperor submitted meekly to be transferred from Pskov to Tsarskoe Selo and thence to Tobolsk, where he was interned with his family—his wife, his son and his four daughters—for months.

The end came with the rumour of a Czechoslovak advance on the Ural in 1918. The Soviet Commissaries in Moscow urged the greatest vigilance on the Ekaterinburg commissar, Yourkovsky, and the commander of the guard, Medvediev, without indicating any means for removing the prisoners from the threatened zone. The communists of Ekaterinburg held a secret meeting in which they decided to put the tsar and his family to death, and sent an order to Yourkovsky. The latter demanded that it should be duly signed, and 16 signatures were affixed to it. On the night of July 16 Yourkovsky roused the prisoners and conducted them into a cellar of the house. Medvediev, with the Lettish guards, entered the room while some Russian soldiers were looking in. Yourkovsky placed the doomed persons at one end of the room and read the sentence hurriedly by torchlight. The tsar stepped forward and said something indistinctly, when Yourkovsky drew his revolver and shot him in the head. A general fusillade followed. Later the corpses were removed and destroyed by fire. Although the belief is general that all members of the family perished, a claim arose in 1928 by Mrs. Anastasia Tschaikovsky that she was the Grand Duchess Anastasia, the tsar's youngest daughter, who had been rescued from the massacre by two soviet soldiers. (*See* RUSSIA.)

NICHOLAS I. (1841–1921), king of Montenegro, was born at Njeguš, the ancient home of the Njeguš-Petrović dynasty, on Sept. 1, 1841. His father, Mirko Petrović, was brother of the Vladika Danilo II. who had declined episcopal office, married and declared the succession hereditary in the direct male line. As, however, Danilo II. left no male issue, and Mirko declined the succession, Nicholas became heir to the throne of Montenegro. He was educated in Trieste and at the Academy of Louis le Grand in Paris, returning to Montenegro on the assassination of his uncle (Aug. 13, 1860). He took part in the campaign against Turkey of 1862, which, after Austria's intervention, was followed by a prolonged peace. In 1868 he travelled to St. Petersburg (Leningrad) to meet the tsar Alexander II., who received him with favour, and afterwards regularly supplied him with subventions of arms and money, referring to him on a memorable occasion as his "only friend." During the Near Eastern crisis of 1876 (*see* EASTERN QUESTION), Nicholas declared war on the Porte, and winning brilliant successes in this and the following wars at Vučidd, Podgorica and Nikčić, captured Antivari and Dulcigno. The Congress of Berlin (*q.v.*) brought Montenegro formal recognition as a sovereign State and doubled her area, besides giving her an outlet on the sea at Antivari. Nicholas now entered on a long period of peace largely filled with intrigues with and against his son-in-law, Peter, later King Peter I. of Serbia (*q.v.*) regarding a possible later Yugoslav state to comprise both Serbia and Montenegro. On Dec. 19, 1900, Nicholas assumed the title of Royal Highness.

In 1905 he was forced by public opinion, which was revolting against his despotic methods, to grant a constitution. He was at once involved in quarrels with his political opponents, culminating in the scandalous but obscure "Cetinje bomb plot" of 1905. On Aug. 28, 1910, encouraged by Austria, who helped to estrange him further from Serbia, Nicholas assumed the title of king. In the Balkan Wars (*q.v.*) he was the first to declare war on Turkey, but although these wars gave Montenegro an accession of territory, the dynasty lost prestige, its unpopularity and with it the movement for the union of Serbia with Montenegro, increased. In the World War Montenegro threw in her lot with Serbia; Nicholas, however, maintained touch with Austria, from whom he begged a separate peace (Jan. 13, 1916). On Jan. 19, Nicholas fled to Italy and France. The breach widened between him and his people, and the "Great National Assembly" on Nov. 26, 1918, proclaimed his deposition and that of his dynasty. The old ex-king passed the remainder of his days in Italy. He died at Antibes on March 1, 1921.

A rude but often benevolent despot of the fighting type, Nicholas was also a poet of talent. His works include *Balkanska Tsaritsa* and *Knyaz Arvaniti* (dramas); *Haïdana, Potini Abenserage* and *Pesnik i Vila* (poems), *Skuplijene Pesme* and *Nova Kola* (songs). In Nov. 1860, Nicholas married Milena (1847–1923) daughter of the *voivode* Petar Vukotić. On the death of Nicholas, his eldest son Danilo was proclaimed by the small monarchist party king of Montenegro (Mar. 1, 1921), but abdicated on Mar. 7, 1921, in favour of his nephew Michael, eldest son of Prince Mirko (b. Sept. 1, 1908).

NICHOLAS (1856–1929), Russian Grand Duke and soldier. Nikolai Nikolaievich was born on Nov. 6, 1856 the grandson of the emperor Nicholas I. and first cousin of the emperor Alexander III. Educated at the school of military engineers, he received his commission in 1872, and in the following year, at the early age of 16, entered the military academy. In the war of 1877–78, as a general staff officer for special service, he joined the staff of his father, the very popular Grand Duke Nikolai Nikolaievich (Senr.), who had been appointed commander-in-chief of the Russian forces. He distinguished himself at the crossing of the Danube at Zimnicea on April 15, 1877, and in the attack on the Shipka.

After the war the Grand Duke joined the Guard Hussar Regiment, in which the emperor Nicholas afterwards served, and passed through every stage as officer till appointed commander in 1884—a position he occupied for 6½ years. He then commanded in succession a brigade and a division, and in 1895 was appointed

inspector-general of cavalry. He held this post for ten years, a period which is regarded as a bright epoch in the history of the Russian cavalry, for he carried through fundamental reforms in training and in the organization of the cavalry schools, of the cavalry reserves and of the remount service.

In 1905 Nicholas was appointed commander-in-chief of the St. Petersburg military district, a post he held till the outbreak of the World War in Aug. 1914. Here, as elsewhere, he gave proof of his zeal for efficiency. Setting himself the task of instilling the lessons of the Japanese war, he encouraged musketry and work in extended order, but at the same time allowed no slackness in ceremonial. To help him in his work he called from the Far East men like Generals Ivanov, Lesh and Lechitski, who were of comparatively humble origin but had made their reputation in the field. The appointment of such men to high command in the Imperial Guard was characterized in his diary at the time by another grand duke as "revolutionary," but the men selected justified their choice in the World War.

In the same year (1905) as he was appointed commander-in-chief of the St. Petersburg military district, Nikolai Nikolaievich became the first president of the newly created council of national defence, and he held this position till 1908, when the council was abolished. During this time the emperor seems to have hesitated between the final adoption of a military system analogous to that of Germany, under which the chief of the general staff, as well as the minister of war, should have the right of access and of direct report to the sovereign, and of the system in vogue in countries with a constitutional Government, under which that right was confined to the minister of war. On the council the Grand Duke worked in close co-operation with General Palitsin, who, in 1908, on the emperor's decision in favour of the latter system, gave way to General Sukhomlinov as chief of the general staff, the latter, in the following year, replacing General Rediger as minister of war.

From 1908 to 1914 Nicholas took no part in the strategical preparation for the war, the work being delegated by the emperor to General Sukhomlinov and his nominees on the general staff. At the outbreak of war the emperor first intended to take command himself, and actually appointed the grand duke Commander-in-chief of the VI. (Reserve) Army at St. Petersburg (Leningrad). It was only on the evening of Aug. 1, the day of Germany's declaration of war, that he yielded to the entreaties of his ministers and decided to hand over the supreme command to the grand duke.

Services During the War.—The commander-in-chief was responsible for carrying out a plan which he had no hand in drawing up, a plan which was dependent on promises previously made, without his cognisance, to the French general staff. He had to work in accordance with the "Regulations for the Direction of the Army in the Field," a new edition of which had been issued on the very eve of the war, handing over much power to the two group commanders.

The plan of the Russian general staff consisted of the invasion of East Prussia by a right group (I. and II. Armies), while a left group (IV., V., III. and VIII. Armies) operated against the Austrians in Galicia, and a centre group (IX. and X. Armies) assembled at Warsaw to advance on Posen. It was owing to the decision of the grand duke that this centre group was broken up, the X. Army being sent north to fill the gap left by the failure in East Prussia, and the IX. Army sent south to overwhelm the Austrians in southern Poland.

When the Germans came to the rescue of their discomfited ally by advancing in Oct. 1914 to the outskirts of Warsaw, the transfer of the Russian armies from left to right in rear of the Vistula, and the concentration of superior forces on the enemy's left or northern flank which compelled his retreat, were masterly movements. If the next German advance, culminating in the operation of Lódz owing to mistakes by Russian army commanders, definitely removed all possibility of an invasion of Posen, the Russians held on through the winter of 1914–15 to the line of the Narev-Vistula-San-Carpathians, and were only compelled by lack of munitions in the spring and summer of 1915 to retreat to a line that they held substantially through 1916–17.

There was no demand from the fighting men at the front for the change at G.H.Q. which occurred on Aug. 21, 1915, when the emperor announced that he would assume the supreme command. It is said that Rasputin had prophesied that the Russian armies would continue to be defeated till the emperor placed himself at their head. Certainly the impostor had no reason to love the Grand Duke Nicholas. A story repeated among the soldiers relates that he had applied to the commander-in-chief for permission to come to the front "to bless the troops," and the latter had telegraphed in reply two Russian words which being translated run—"Come, I shall hang you."

The grand duke was appointed viceroy and commander-in-chief in the Caucasus. Up to that time the brunt of the fighting against Turkey had been borne by the British in Gallipoli, the Sinai Peninsula and Mesopotamia. The advent of the new commander put new life into the Russian forces. He pushed forward an expeditionary force under General Baratov through Enzeli and Hamadan to screen Persia from further German penetration, and to establish touch with the British troops in Mesopotamia. He collected guns and stores, and raised and trained efficient troops, and, in spite of immense difficulties in supply, ably assisted by Generals Yudenich and Prjvalski, occupied in three successful offensives all Armenia, including the fortress of Erzerum, the port of Trebizond and the town of Erzinjan.

The revolution of March 12, 1917, found the grand duke still in the Caucasus. The emperor's last official act was to nominate him to be once more supreme commander-in-chief. His journey from the Caucasian headquarters at Tiflis to the headquarters at Mogilev was in the nature of a triumphal procession, patriotic demonstrations and crowds of people greeting him at every station on the way. Twenty-four hours after his arrival at Mogilev he received a telegram from Prince Lvov, the chief of the provisional Government, cancelling his appointment. The next two years the grand duke spent in the Crimea, taking no part in politics. At last, in March 1919, he left Russian soil on the British cruiser "Marlborough," and lived quietly near Paris. He died in Jan. 1929. (A. W. F. K.)

NICHOLAS, SIR EDWARD (1593–1669), English statesman, was born on April 4, 1593, of a Wiltshire family. He was educated at Salisbury grammar school, Winchester college and Queen's college, Oxford. After studying law at the Middle Temple, Nicholas became secretary to Lord Zouch, warden and admiral of the Cinque ports, in 1618, and continued in a similar employment under the duke of Buckingham. In 1625 he became secretary to the Admiralty; then extra clerk of the privy council with duties relating to Admiralty business, and from 1635 to 1641 he was one of the clerks in ordinary to the council. In this situation Nicholas was concerned with the levy of ship-money. He had Charles's confidence, became a privy councillor and a secretary of State, and attended the king at Oxford, and carried out the business of the treaty of Uxbridge. Nicholas arranged the details of the king's surrender to the Scots, though he does not appear to have approved of the step; and he arranged the capitulation of Oxford. He went to France, and after the king's death he remained on the Continent concerting measures on behalf of the exiled royal family, but he never had any real influence with Charles II. After the Restoration he lived in retirement.

See *The Nicholas Papers*, ed. by G. F. Warner (Camden Society, 1886–97), containing Nicholas's correspondence and some autobiographical memoranda. Private correspondence between Nicholas and Charles I. will be found in the *Memoirs of John Evelyn*, ed. by W. Bray (1827); *The Egerton Mss.* and the *Ormonde Papers* contain many references to Nicholas.

NICHOLAS, NORTHERN or **LENIN LAND** lies in the Arctic sea, about 30 m. N. of Cape Chelyuskin, extending in a north-easterly direction from 77° 50′ N., 99° E. to beyond 81° N. The small Alexis (Little Taimir) and Starokadomski islands lie at the eastern end of Alexis strait, which separates Nicholas Land from the mainland. This land was discovered in 1913 by the Russian hydrographical expedition in the "Taimir" and "Vaigach" under B. A. Vilkitski. He took possession for Russia and charted the eastern side. In the following year he returned and

charted the southern coast. The northern and western sides are unknown. The east coast is much indented and a deep gulf or strait occurs in about 79° N. In the south there is a low plain covered with tundra, but on the east the land is lofty (1,500 ft.) and flat-topped with large valley glaciers. Both sedimentary and volcanic rocks occur, but details are lacking. Water of over 100 fathoms depth lies close to the eastern side.

See papers in *Petermann's Mitteilungen,* 60 (1914); *Geographical Journal* (Dec. 1919), and *Geographical Review* (July 1925). (R. N. R.-B.)

NICHOLS, JOHN (1745–1826), English printer and author, was born at Islington on Feb. 2, 1745. He edited the *Gentleman's Magazine* from 1778 till his death, and in that periodical, and in his numerous volumes of *Anecdotes and Illustrations,* he made invaluable contributions to the personal history of English men of letters in the 18th century. He was apprenticed in 1757 to "the learned printer," William Bowyer, who took him into partnership in 1766. On the death of his friend and master in 1777 Nichols published a brief memoir, which afterwards grew into the *Anecdotes of William Bowyer and his Literary Friends* (1782). *The Literary Anecdotes of the 18th Century* (1812–1815), into which the original work was expanded, forms only a small part of Nichols's production. It was followed by the *Illustrations of the Literary History of the 18th Century, consisting of Authentic Memoirs and Original Letters of Eminent Persons,* which was begun in 1817 and completed by his son John Bowyer Nichols (1779–1863) in 1858. He died on Nov. 26, 1826.

Nichols's other works include: A *Collection of Royal and Noble Wills* (1780); *Select Collection of Miscellaneous Poems* (1782), with subsequent additions, in which he was helped by Joseph Warton and by Bishops Percy and Lowth; *Bibliotheca Topographica Britannica* (1780–1790); with Richard Gough, *The Progresses and Public Processions of Queen Elizabeth* (1788); and the *History and Antiquities of the Town and County of Leicester* (8 vols., 1795–1815).

A full memoir of John Nichols by Alexander Chalmers is contained in the *Illustrations,* and a bibliography in the *Anecdotes* (vol. vi.) is supplemented in the later work. *See* also R. C. Nichols, *Memoirs of J. G. Nichols* (1874).

NICHOLS, ROBERT MALISE BOWYER (1893-1944), English poet and writer, the son of J. B. B. Nichols, also a poet, was born on Sept. 6, 1893, and educated at Winchester and at Trinity college, Oxford. In 1914 he obtained a commission in the Royal Field Artillery, and served in France until 1916. From 1918 to 1919 he was engaged on propaganda work in the United States for the Ministry of Information. From 1921 to 1924 he was professor of English literature at the Imperial college, Tokyo. In addition to his published work, he contributed to *The London Mercury* and other periodicals. Nichols died Dec. 17, 1944.

His published work includes *Invocation,* poems (1916); *Ardours and Endurances* (1917); *The Budded Branch* (1918); *Aurelia* (1920); *The Smile of the Sphinx* (1920); *Guilty Souls,* drama (1922); *Wings over Europe,* drama, with M. Browne (1929); *Fisbo,* a satirical poem (1934); *Such Was my Singing,* poems (1942).

NICHOLSON, JOHN (1822–1857), British soldier and administrator of India, son of Alexander Nicholson, a north of Ireland physician, was born Dec. 11, 1822, and educated at Dungannon College. He was presented with a cadetship in the Bengal infantry in 1839 by his uncle Sir James Hogg, and served in the first Afghan War of 1839–42; he distinguished himself in the defence of Ghazni, and was one of the prisoners who were carried to Bamian and escaped by bribing the guard upon General Pollock's successful advance. In Afghanistan Nicholson first met Sir Henry Lawrence, who got him the appointment of political officer in Kashmir and subsequently on the Punjab frontier. In 1847 he was given charge of the Sind Sagar district, and did much to pacify the country after the first Sikh War. On the seizure of Multan by Mulraj, he rendered great service in securing the country from Attock, and was wounded in an attack upon a tower in the Margalla Pass, where a monument was subsequently erected to his memory. On the outbreak of the second Sikh War he was appointed political officer to Lord Gough's force, when he rendered great service in the collection of intelligence and in furnishing supplies and boats.

On the annexation of the Punjab he was appointed deputy commissioner of Bannu. There he became a kind of legendary hero, and many tales are told of his stern justice, his tireless activity and his commanding personality. In the course of five years he reduced the most turbulent district on the frontier to such a state of quietude that no crime was committed or even attempted during his last year of office, a condition of things never known before or since. He would go personally to the scene of a crime or a legal dispute and decide the question on the spot. Every man in his district, whether mountain tribesman or policeman, felt that he was controlled by a master hand, and the natives said of him that "the tramp of his war-horse could be heard from Attock to the Khyber." It is little wonder that the natives worshipped him as a god under the title of Nikalsain.

When the Mutiny broke out in May 1857 Nicholson did more than any other single man to keep the Punjab loyal and to bring about the fall of Delhi. When the news of the rising at Meerut arrived, Nicholson was with Edwardes at Peshawar, and they took immediate steps to disarm the doubtful regiments in that cantonment. Together they opposed John Lawrence's proposal to abandon Peshawar, in order to concentrate all their strength on the siege of Delhi. In June Nicholson was appointed to the command of a movable column, with which he again disarmed two doubtful regiments at Phillaur. In July he made a forced march of 41 m. in a single day in the terrific heat of the Punjab summer, in order to intercept the mutineers from Sialkot, who were marching upon Delhi. He caught them on the banks of the Ravi near Gurdaspur, and utterly destroyed them, thus successfully achieving what hardly any other man would have attempted. In August he had pacified the Punjab and was free to reinforce Gen. Archdale Wilson on the ridge before Delhi.

Before Nicholson's arrival the counsels of the commanders before Delhi, like those at Meerut, suffered from irresolution and timidity. As General Wilson's health declined, his caution became excessive, and Nicholson was especially sent by Sir John Lawrence to put more spirit into the attack. His first exploit after his arrival was the victory of Najafgarh, which he won over the rebels who were attempting to intercept the British siege-train from Ferozepur. After marching through a flooded country scarcely practicable for his guns, Nicholson, with a force of 2,500 troops, defeated 6,000 disciplined sepoys after an hour's fighting and thenceforth put an end to all attempts of the enemy to get in the rear of the British position on the ridge. Nicholson grew fiercely impatient of General Wilson's procrastination and at one time was thinking of appealing to the army to set Wilson aside and elect a successor; but at last, on Sept. 13, he forced Wilson to make up his mind to the assault, and he himself was chosen to lead the attacking column. On the morning of Sept. 14 he led his column, 1,000 strong, in the attack on the Kashmir gate and successfully entered the streets of Delhi. But in trying to clear the ramparts as far as the Lahore gate, he undertook a task beyond the powers of his wearied troops. In encouraging them as they hesitated, he turned his back on the enemy and was shot in the back. The wound was mortal; he died on Sept. 23.

His best epitaph is in Sir John Lawrence's Mutiny report:

> Brigadier-General John Nicholson is now beyond human praise and human reward. But so long as British rule shall endure in India, his fame can never perish. He seems especially to have been raised up for this juncture. He crowned a bright, though brief, career by dying of the wound he received in the moment of victory at Delhi. The Chief Commissioner does not hesitate to affirm that without John Nicholson Delhi could not have fallen.

NICHOLSON, JOSEPH SHIELD (1850–1927), British economist, son of an Independent minister, was born on Nov. 9, 1850 at Wrawby in Lincolnshire, and educated at Edinburgh university and Trinity college, Cambridge, where he won the Cobden Prize in 1877 (the first award), and again in 1880. After studying at Heidelberg and at London university, he became a private tutor at Cambridge.

In 1880 he went to Edinburgh university as professor of political economy. He wrote more than 20 volumes on economics, of which the chief are: *The Silver Question* (1886), *Money and Monetary Problems* (1888), *Bankers' Money* (1903), *The Tariff Question* (1903), *The History of the English Corn Laws* (1903), *Project of Empire* (1909) and *Principles of Political Economy* (3 vols., 1893, 1897, 1901). In all his economic writings he advocated the principles of Adam Smith. He resigned his chair in 1925 and died in Edinburgh on May 12, 1927.

NICHOLSON, MEREDITH (1866–1947), U.S. writer, was born at Crawfordsville, Ind., Dec. 9, 1866, and educated in the public schools of Indianapolis. He was a reporter and later editor on the *Indianapolis News* and was U.S. minister to Paraguay (1933–34), Venezuela (1935–38) and Nicaragua (1938–1941). He died on Dec. 21, 1947, in Indianapolis.

He published the following novels: *The Main Chance* (1903), *The House of a Thousand Candles* (1905), *The Port of Missing Men* (1907), *The Little Brown Jug at Kildare* (1908), *The Lords of High Decision* (1909), *A Hoosier Chronicle* (1912), *The Poet* (1914), *And They Lived Happily Ever After* (1925), *The Cavalier of Tennessee* (1928), *Poems* (1906) and several historical and critical volumes, including *The Hoosiers* (1900) and *The Valley of Democracy* (1918).

NICHOLSON, WILLIAM (1753–1815), English writer on natural philosophy, was born in London in 1753. Nicholson occupied himself with writing and lecturing on natural philosophy, including chemistry, and with the construction of various machines and the first voltaic pile in England. In 1797 the *Journal of Natural Philosophy, Chemistry and the Arts,* generally known as *Nicholson's Journal,* the earliest work of the kind in Great Britain, was begun; it was carried on till 1814. He died in London on May 21, 1815.

Besides contributions to the *Philosophical Transactions,* Nicholson wrote translations of Fourcroy's *Chemistry* (1787) and Chaptal's *Chemistry* (1788), *First Principles of Chemistry* (1788) and a *Chemical Dictionary* (1795); he also edited the *British Encyclopaedia, or Dictionary of Arts and Sciences* (6 vols., London, 1809).

NICHOLSON, SIR WILLIAM (1872–1949), English painter, engraver and illustrator, was born in Newark-on-Trent in 1872. He first became known to the wider public by his illustrative work in *An Alphabet, An Almanack of Sports* (with Rudyard Kipling) and *London Types* (with W. E. Henley) in 1898; by the "Portrait of Queen Victoria," a delightful coloured wood engraving; the *Velveteen Rabbit* with its clever end papers and by the whole series of quaint and witty books and posters which he produced in collaboration with his brother-in-law, James Pryde (as "the Beggarstaff Brothers").

His more serious work is found in his painting, whether dealing with a portrait, a landscape or still life. Among his paintings in oil are "The Black Pansy," "The Landlord" (Manchester City Art gallery), "The Girl with the Tattered Gloves," "Fish" and the portraits of "Marie Tempest," "Ursula Lutyens" and "The Master of Jesus." Other works are the "Square Book of Animals" and the "Buildings of Oxford." Nicholson was knighted in 1936. He died at Blewbury, Berkshire, Eng., May 16, 1949.

See monograph in *Contemporary British Artists* (1923).

NICIAS (d. 414 B.C.), a soldier and statesman in ancient Athens, inherited from his father Niceratus a considerable fortune invested mainly in the silver mines of Laurium. Evidence of his wealth is found in the fact that he had no less than 1,000 slaves whom he hired out. He was several times colleague with Pericles in the strategia, and on Pericles' death became the leading advocate of the Periclean policy of pinpricks (ἐπιτειχισμοί) and concentration on the Thraceward region against the offensive policy of the democrats under Cleon. At the amphibious tactics of the ἐπιτειχισμός he was unsurpassed. Having been largely responsible for the "peace of Nicias" (421), he appears in the rather obscure history of the following years as the leader of the peace party, in opposition to Alcibiades. In 415, much against his will, he was appointed leader of the Sicilian expedition with Alcibiades and Lamachus; and the recall of Alcibiades, followed by the death of Lamachus, left him in sole command. Demosthenes came out with reinforcements early in 413 and took charge for a brief space, but at the end the main responsibility for the delay, and so perhaps for the disaster, rests with Nicias. He was put to death during that year by the Syracusans.

Besides Thucydides *see* Plutarch's *Nicias* and Diod, xii, 83; also GREECE and PELOPONNESIAN WAR, THE.

NICKEL (symbol Ni), a grayish-white metallic element, hard, tough and markedly resistant to oxidation and corrosion. It is widely familiar because of its use in coinage, but has become more important for its many domestic, industrial and military applications, which during the period 1939–49 consumed more than 250,000,000 lb. of the element each year. The metal itself is well suited for direct use in many kinds of mechanical equipment, but it is more commonly employed in the form of alloys. Use in this form dates from prehistoric times, for early man fashioned some of his implements from meteoric iron, which normally contains 5% to 15% nickel. It was also used in alloy form by the Chinese in ancient days, but nickel itself was not isolated until 1751, when A. F. Cronstedt prepared an impure sample from an ore containing niccolite (NiAs). An ore of this same type had earlier caused copper and silver miners in Saxony considerable trouble because it yielded a brittle unfamiliar product. They came to refer to it as "kupfernickel," after "Old Nick" and his mischievous gnomes, and Cronstedt applied their name to his new element. His results were confirmed in 1775 by T. O. Bergman, and the name nickel soon became generally accepted. About a century elapsed, however, before nickel was mined in quantity for a growing world market.

Occurrence and Production.—Nickel is the 24th element in order of abundance, and constitutes about 0.016% of the earth's crust. It is a fairly common minor constituent of igneous rocks but there are singularly few deposits which qualify with respect to concentration, size and accessibility for commercial interest. The most important sources of the metal are the mixed sulphide ores containing pentlandite, $(Fe,Ni)S$; nickeliferous pyrrhotite, Fe_5S_6 to $Fe_{16}S_{17}$; and nickeliferous chalcopyrite, $CuFeS_2$. Ores of this type are mined on a large scale in the Sudbury district of Ontario, Can., and to a lesser extent in the Petsamo district of Finland, ceded to the U.S.S.R. during World War II. Minor deposits of nickeliferous sulphide ores occur in Norway, China, India, Alaska and the United States (Missouri), but the production from these sources is not appreciable. Complex silicate ores containing garnierite, $H_2(Ni,Mg)SiO_4$, and other mixed silicates constitute an important secondary source of the metal. They are mined notably in New Caledonia and occur in some quantity in Venezuela, Brazil, the U.S.S.R. and to a lesser extent in Greece, Egypt and the United States (North Carolina and Oregon). The nickeliferous iron oxide ores of Cuba served as a source of the metal during World War II. Ores of this same type occur in Greece, Borneo and the Republic of the Philippines. Selected production figures in millions of pounds of nickel are summarized in the following table:

Year	1935	1940	1945	1948
Canada	138.5	245 5	245.1	262.1
New Caledonia	13 9	23.2	9.5	10.7
Cuba	0.0	0.0	24.0	0 0
All others	14.0	39.9	40.8	57.9
World total	166.4	308.6	319.4	330.7

Metallurgy.—The metallurgy of nickel is fairly complex and costly. The nickeliferous sulphide ores of Canada, which are embedded in a matrix of basic rock, are first ground and carried through a series of flotation processes which yield nickel and copper concentrates. The nickel concentrate is roasted to reduce the sulphur content and then smelted to a matte which, after controlled cooling followed by grinding and flotation, yields a material which is essentially nickel sulphide. This concentrate is sinter roasted and the resulting product goes in part to the market as nickel oxide sinter for use in the alloy steel industry, and the balance is reduced and either melted into anodes for electrolytic refining, or converted into the volatile carbonyl (Mond process) for recovery as highly purified nickel pellets. The silicate ores are fused with calcium carbonate, calcium sulphate and coke to yield a double sulphide of nickel and iron and a siliceous slag which is discarded. This crude matte is smelted under conditions which eliminate the iron as a silicate and yield a fairly

pure nickel sulphide which can readily be converted to the metal. The nickeliferous iron ores are selectively reduced and the nickel extracted as the soluble nickel ammonia complex by treatment with a mixture of ammonium hydroxide and ammonium carbonate solution in the presence of oxygen. This solution is handled by countercurrent techniques and on being stripped of ammonia for re-use, yields a precipitate of basic nickel carbonate which can be calcined to nickel oxide for direct sale. The metal may be obtained on a laboratory scale by the reduction of nickel hydroxide, nitrate or formate and by the electrolysis of soluble nickel salts, such as nickel sulphate, in the process of nickel plating.

Physical Properties.—Nickel has an atomic number of 28 and occurs in Group VIII of the periodic arrangement of the elements, after iron and cobalt and above palladium and platinum. It resembles iron in strength and toughness but is more like copper, which follows it with atomic number 29, in resistance to oxidation and corrosion. This combination of useful properties accounts for many of its applications. Nickel has an atomic weight of 58.69 and consists of the following stable isotopes:

Mass number	58	60	61	62	64
Per cent abundance	67.76	26.16	1.25	3.66	1.16

Radioactive isotopes with half lives ranging up to about 60 hours have been prepared. Nickel has the following physical constants:

Density, g./cm.^{3}	8.90 (20° C.)
Melting point, °C.	1455
Boiling point, ° C.	2900
Specific heat, cal./g./° C.	0.1095 (18° C.) .1340 (1360° C.)
Latent heat of fusion, cal./g.	73
Coefficient of expansion, cm./cm./° C.	0.0000129 (25–100° C.) .0000135 (375–1000° C.)
Thermal conductivity, cal./cm.^{2}/sec./° C./cm.	0.142 (18° C.)
Hardness, Brinell number	85 (99.99% Ni, annealed) 210 (99.4% Ni, cold-rolled)
Atomic radius, Å (Ångstrom unit=10^{-8} cm.)	1.24
Ionization potential, volts	7.61 (I), 18.2 (II)
Electrode potential, molal, volts	+0.231 (25° C.)
Electrical conductivity, basis copper=100%	16%
Resistivity, ohm-cm.	7.8 (20° C.)
Magnetic permeability, μ,	110 (initial) 600 (maximum)
Curie temperature, ° C.	360
Tensile strength, lb./in.^{2}	46,000 (99.99% Ni, annealed) 105,000 (99.4% Ni, cold-rolled hard temper)

Uses of Nickel in Alloys and As the Metal.—More than 65% of the nickel produced is normally incorporated in alloys with iron. Nickel steels (0.5%–10% nickel) possess special properties of strength and toughness and are used in great quantities in the manufacture of automobiles, trucks, buses, ships, aeroplanes, railway locomotives and cars and special parts for most types of transportation equipment. They are also used in agricultural equipment, machine tools, mining and excavating machinery, oil well and refinery equipment, steel mill machinery, power-generating equipment and many types of steel construction. Stainless steels (2%–26% nickel) are resistant to corrosion, tarnish and stain and are used extensively wherever these properties in association with strength and toughness are required, as, for example, in transportation equipment such as streamlined trains, aeroplanes and truck tanks; kitchen equipment, tableware and cooking utensils; and in equipment for the chemical and process industries, textile and paper mills and oil refineries. Heat-resistant steels (2%–26% nickel) are used to meet the high-temperature requirements of furnace and other equipment parts for the glass, ceramic, metal and chemical manufacturing industries. Many other alloys with iron such as the nickel cast irons (1%–5% nickel) meet special needs in the manufacture of metal equipment.

About 15% of the nickel produced is used in high nickel alloys with copper (65%–70% nickel). These alloys have many desirable physical properties and are highly resistant to corrosion. They are extensively used in building, chemical and food-processing equipment and in marine and power-generating equipment. Considerable quantities are also incorporated in cupronickel alloys (2.5%–45% nickel), which are used notably for condenser tubes and salt-water lines. Increasing quantities of nickel are being used in heat-resisting alloys (commonly 78% nickel, 14% chromium, the balance iron and minor elements) which retain their properties of strength, toughness and resistance to oxidation and corrosion at high temperatures, and in electrical resistance alloys (80%–85% nickel) which are used in heating elements, pyrometers, rheostats and other electrical controls. Magnetic alloys (29%–90% nickel), nonmagnetic alloys (8%–27% nickel), permanent magnet alloys (14%–32% nickel), high permeability alloys (45%–80% nickel) and controlled expansion alloys (30%–60% nickel) have been developed for many diverse applications. Nickel coinage (25%–100% nickel) has been adopted in many countries and the so-called nickel silvers (10%–30% nickel, the balance primarily copper and zinc) are used in many familiar articles such as plated silverware stock, slide fasteners, decorative hardware and jewellery. Many other alloys are in current usage and new nickel alloys are constantly being developed for changing industrial needs. (*See* ALLOYS; STEELS, ALLOY.)

About 15% of the nickel produced is normally used directly as the virtually pure metal. It is employed in equipment for the food-processing, chemical and radio industries. Nickel, as well as stainless steel and other nickel alloys, is used to clad steel and provides, in an economical way, a protective coating which is markedly effective against the corrosive action of chemicals. It is similarly used in electroplating, where it is particularly useful to secure protection from atmospheric corrosion and is kept free from tarnish by a thin layer of chromium.

Chemical Properties and Compounds.—The 28 orbital electrons of nickel are distributed as follows: $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $3d^8$ and $4s^2$. The two electrons in the highest energy level ($4s$) are readily yielded to form a stable, doubly charged cation. The electrode potential for this reaction is +0.231 v., placing nickel above hydrogen in the electromotive series in the following position: Co, *Ni*, Sn, Pb, H. The metal reacts slowly with strong acids under ordinary conditions to liberate hydrogen and form Ni^{++}. The salts formed are slightly acid and yield a precipitate of hydrous nickel oxide when the pH of dilute solutions is raised above about 6.7. The metal is uniquely resistant to the action of alkalies and is frequently used for containers to handle concentrated solutions of sodium hydroxide. The element exhibits only a minor tendency to assume the univalent or tervalent states and such ions are not stable in aqueous solution. The third shell contains only 16 electrons, lacking 2 of the stable inert gas arrangement, and many of the compounds involving special valence forces can be attributed to this electronic structure.

Nickelous oxide, NiO, is by far the most common oxide of the metal. It occurs in nature in small quantities as the mineral bunsenite and can be prepared by heating nickel sulphide in air, nickel hydroxide and basic carbonates, nickel nitrate and many other nickel derivatives. In fact, it is usually the end product of the ignition of nickel compounds in air. It can be reduced to nickel by heating with carbon, hydrogen and other reducing gases. It is soluble in strong acids unless it contains impurities or has been sintered, in which case fusion with $KHSO_4$ may be necessary. Nickel oxide is used in ground-coat enamels for its beneficial effects on adherence and in colouring ceramics and glass. Nickelous hydroxide, $Ni(OH)_2$, is obtained as a light-green precipitate when nickel salts are treated with alkalies. It is readily soluble in acids and ammonium hydroxide, yielding in the latter case the complex ion $Ni(NH_3)_4^{++}$. It may be reduced with hydrogen at sufficiently low temperatures to yield active nickel catalysts and is incorporated in the Edison nickel-iron alkaline storage battery, where it yields higher valent hydrous oxides when the battery is charged. Basic nickel carbonates result from the reaction between nickel salts and alkali carbonates. If a mixture of alkali and hypohalite is used, higher hydrous oxides of variable composition are yielded as black precipitates. These products are all converted to nickelous oxide, NiO, on complete dehydration and yield exclusively the double-charged nickel cation on solution in acids. Nickel forms a related series of compounds with sulphur. In addition to the commercially important mixed sulphide ores already mentioned, such minerals as millerite (NiS) and polydymite (Ni_3S_4) belong to this group of compounds. Nickelous sulphide, NiS, is highly insoluble and is readily precipitated when nickel salts are mixed with alkaline sulphides in aqueous solution. Other sulphides, such as Ni_3S_2, can be obtained by direct reaction of sulphur and sulphur compounds with the metal and its derivatives.

Nickel sulphate is the most familiar salt. It can readily be prepared by dissolving nickel metal or nickelous hydroxide in sulphuric acid. It is quite soluble in water (140 g. Ni per 1,000 ml. water at 0° C., 761 g. at 100° C.) and can be purified by recrystallization, to yield the heptahydrate, $NiSO_4 \cdot 7H_2O$, in the form of emerald-green rhombic prisms. This salt yields a yellow anhydrous nickel sulphate when heated above 300° C., and when strongly heated above 840° C. loses SO_3 and leaves a residue of NiO. The hydrated salt is widely employed in plating baths and in dips for steel vessels which are to be coated with vitreous enamel and commonly serves as a reagent for the preparation of nickel catalysts. The nickel halides and nickel nitrate can be similarly prepared and purified. Nickel chloride crystallizes as the hexahydrate, $NiCl_2 \cdot 6H_2O$, and becomes anhydrous when heated above 140° C. Nickel nitrate hexahydrate, $Ni(NO_3)_2 \cdot 6H_2O$, dissolves in its own water of crystallization at about 57° C., readily dehydrates at higher temperatures and decomposes at about 300° C. to yield NiO in air, or pyrophoric nickel when heated in a reducing atmosphere. It is used in the preparation of special nickel catalysts and powders and, along with the chloride, is also used to some extent in nickel plating. Most nickel salts form double compounds with other salts, and co-ordination complexes with ammonia. Nickel also forms co-ordination complexes with alkali cyanides and in this behaviour exhibits properties similar to those of palladium and platinum.

Nickel readily forms salts with organic acids, either by direct reaction between nickelous hydroxide and the acid or by double decomposition between suitable salts. Nickel formate, $Ni(HCOO)_2$, which is one of

the most familiar of these, is unique in that it decomposes at about 240° C. to give off hydrogen and carbon dioxide, leaving a residue of finely divided nickel which is particularly useful as a hydrogenation catalyst. The higher fatty acid salts, such as the stearate and oleate, are water insoluble and exhibit colloidal properties typical of the metal soaps when dispersed in organic liquids.

Nickel forms a series of compounds in which co-ordination or secondary valence forces are involved in addition to those of the usual salt structure. The highly insoluble, striking red derivative with dimethylglyoxime, commonly precipitated in nickel analyses, is a characteristic inner-complex compound involving a chelate ring. This derivative is nonpolar in character, highly insoluble in water, but somewhat soluble in chloroform and other organic solvents. It sublimes without decomposition when heated *in vacuo,* but is readily converted quantitatively to NiO on strong heating in air. No true alkyl derivatives had been reported in the literature at mid-20th century, and it is possible that they are unstable under ordinary conditions.

Nickel carbonyl, $Ni(CO)_4$, is an unusual compound in that it contains a neutral nickel atom surrounded by four co-ordinately bound carbonyl groups. It can be prepared by treating at 25° C. finely divided metallic nickel, such as is obtained by decomposing the formate at minimum temperatures, with carbon monoxide; sulphur acts as a catalyst for this reaction. The product is a colourless mobile liquid with a high vapour pressure and is very poisonous if inhaled. It boils at 43° C. and begins to decompose at 60° C. or less, depending on the conditions, to metallic nickel and carbon monoxide. A very fine nickel powder may be prepared in this manner, or pellets may be built up on nuclei of nickel as in the Mond process. A bright nickel mirror or nickel plate may also be obtained and nickel carbonyl can serve as a source of reactive carbon monoxide in certain organic syntheses. (*See* CARBONYLS, METAL.)

Analytical.—Nickel is precipitated in the ammonium sulphide group along with cobalt, manganese, zinc and iron in systematic analyses. The nickel and cobalt sulphides remain as undissolved residue after the precipitate is extracted with 1N hydrochloric acid. The two elements may be differentiated by the fact that nickel gives a red precipitate in the dimethylglyoxime tests, or a brown borax bead. In quantitative analysis nickel may be isolated and weighed directly as the dimethylglyoxime complex, or this compound may be ignited to NiO. It may also be determined by a volumetric procedure, such as with potassium cyanide solution (the complex nickel cyanide ion, $Ni(CN)_4^{=}$, is formed) using silver iodide as an indicator, or by electrolysis of a strongly ammoniacal solution.

Uses of Nickel Compounds.—Nickel compounds have been used mainly in electroplating, in the production of nickel catalysts, in ground-coat enamels, in storage batteries of the Edison type, and in the production of special nickel powders. Many nickel compounds exhibit insecticidal, fungicidal and bactericidal action, but have not received wide practical use because of the availability of effective cheaper materials. Ingested nickel is relatively nontoxic and any quantities that might be picked up incidentally through the use of nickel or nickel-alloy cooking utensils or in fats hydrogenated over nickel catalysts are considered to be without physiological action.

Nickel Catalysts.—Nickel catalysts are among the most familiar in catalytic chemistry and have been the subject of intensive investigations of both theoretical and applied nature. Probably more than 1,000,000 lb. of the metal was used in this field each year over the decade from 1939 to 1949. Catalytic nickel can be prepared by many different methods. Nickelous hydroxide and basic carbonates, nickel nitrate, formate and various other organic compounds yield, on thermal decomposition at moderate temperatures in a reducing atmosphere, finely divided nickel in a highly active form. Nickel sulphate and other soluble salts are frequently the starting reagent. The precipitates obtained when they are mixed with alkalies in aqueous solution, frequently in admixture with carrier materials such as diatomaceous earth, are washed, dried and reduced. Nickel formate yields active nickel directly when it is decomposed without access to air, such as under oils which are to be treated. Nickel alloys containing a metal which can be selectively dissolved away, such as the nickel-aluminum preparations of M. Raney which yield on treatment with sodium hydroxide soluble sodium aluminate and an active nickel residue, are commonly employed. Nickel catalysts are most frequently utilized in hydrogenating unsaturated organic compounds. The element, in common with palladium and platinum, exhibits unusual capacity to occlude hydrogen, and its effectiveness as a catalyst in reactions involving hydrogen is frequently explained in terms of this phenomenon. The most familiar application is the hydrogenation of fats and oils, in the process known as fat hardening. A fraction of 1% of active, finely divided nickel suffices to catalyze the addition of hydrogen to unsaturated compounds in vegetable, animal and fish oils, converting them from liquids to solids with more desirable physical properties and greatly improved chemical stability. The nickel is recovered by filtration and may be re-used or may be employed in continuous processes. Many millions of pounds of natural oils are treated annually in this manner for use in edible products such as shortenings and oleomargarine, in soaps and numerous industrial preparations. Nickel catalysts are also extensively used in many operations in industrial chemistry, especially in the synthesis of organic chemicals and pharmaceuticals, and in desulphurization operations in petroleum chemistry and in the production of gaseous fuels. Although the quantity of nickel used in chemical operations is dwarfed by the great tonnages which go into structural applications, it has become a reagent of great importance in the expanding chemical industries.

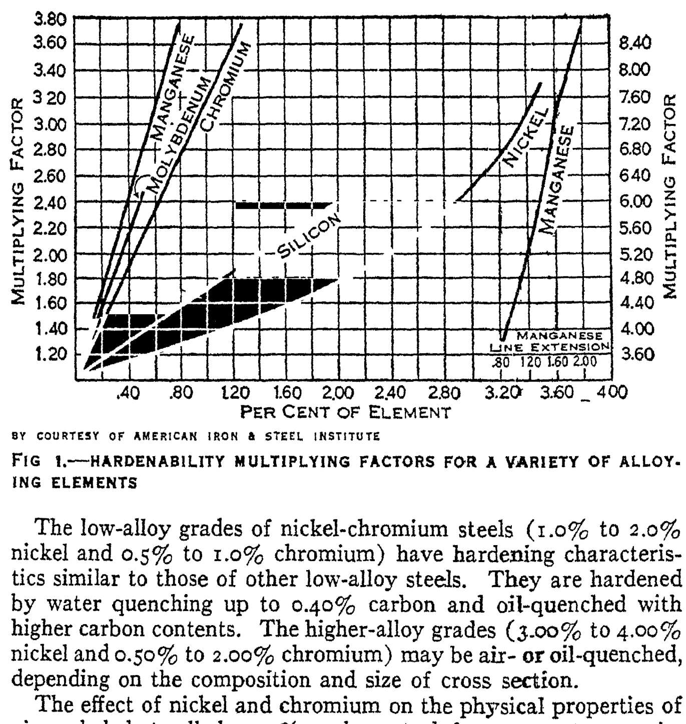
NICKEL-CHROMIUM STEELS. Nickel-chromium steel, an alloy of iron, nickel (1–4%), chromium (0.40–1.75%), and carbon (0.05–0.60%), constitutes one of the oldest and most widely used classes of low-alloy steels. Nickel, which forms austenite, a noncarbide constituent of steel, is added to steel to increase strength and toughness, with a moderate effect on hardenability. Chromium unites with carbon to form complex carbides and increase hardenability greatly if carbon (above 0.10%) is present. The effect of nickel, chromium and other elements on the hardenability of steel is illustrated in fig. 1.



BY COURTESY OF AMERICAN IRON & STEEL INSTITUTE

FIG 1.—HARDENABILITY MULTIPLYING FACTORS FOR A VARIETY OF ALLOYING ELEMENTS

The low-alloy grades of nickel-chromium steels (1.0% to 2.0% nickel and 0.5% to 1.0% chromium) have hardening characteristics similar to those of other low-alloy steels. They are hardened by water quenching up to 0.40% carbon and oil-quenched with higher carbon contents. The higher-alloy grades (3.00% to 4.00% nickel and 0.50% to 2.00% chromium) may be air- or oil-quenched, depending on the composition and size of cross section.

The effect of nickel and chromium on the physical properties of air-cooled, hot-rolled 0.20% carbon steel for a 0.05 to 0.75 in. section is illustrated in fig. 2.

Nickel-chromium steel may be produced in an electric or open-hearth furnace. Nickel is not oxidized in the molten bath and therefore yields 100% recovery (*see* NICKEL STEEL). Chromium presents a different problem because it is oxidized and enters the slag under normal basic open-hearth operations. It is, therefore, not recovered from scrap in this operation, and additions must be made in the bath after it is thoroughly deoxidized or to the ladle during the tap. Recovery of chromium is possible, however, in the electric furnace with proper slag manipulation (*see* STAINLESS STEEL); that is, using a reducing slag or the addition of silicon or chrome silicide (reducing agents) to the furnace bath following an oxidizing condition to reduce the Cr_2O_3 in the slag to chromium and return it to the metal portion. Nickel-chromium steel may also be made in an acid open-hearth or acid electric furnace, using raw materials free from undesirable elements that cannot be removed by these processes. Nickel-chromium steels may be poured into

ingots or castings; and the usual deoxidizer, as in nickel steel, is silicon, which is added in the ladle to about 0.25% of the final chemical analysis of the heat. Ingots are stripped and placed in soaking pits as soon as they are solidified to prevent cooling cracks.

FIG. 2.—EFFECT OF (A) NICKEL AND (B) CHROMIUM ON THE TENSILE PROPERTIES OF ROLLED CARBON STEELS

Semifinished products, such as blooms, slabs, and shapes, are stacked close together to prevent cooling cracks. Nickel-chromium steels are subject to flakes or hair cracks, as are many other air-hardening steels. No specific cure has been found; but thorough deoxidation, slow pouring at correct temperatures, and slow heating and cooling assist in avoiding flakes.

Nickel-chromium steels hold first place in use in the United States for important parts that are to be case-hardened or for highly stressed forgings. They are also widely used for heavy castings, such as those for bridges, locomotives and rolling-mill machinery, and for abrasion-resisting castings, such as power-shovel teeth and impact hammers.

The table shows a wide range of about 60 A.I.S.I. and S.A.E. nickel-chromium steels used in the United States.

Steels of the 3100 series, such as 3115 and 3120, are low-cost carburizing grades used for piston rings, automotive power train gears, oil-well-bit reamer cutters, and many other small, case-hardened parts. The S.A.E. 3200 steels containing 2% nickel and 1% chromium are most often used in the high carbon ranges. These steels are superior to the 3100 series in tensile properties and are used for automobile drive and axle shafts, master connecting rods of radial aircraft engines and many highly stressed keys and pins. Steel of the A.I.S.I. 3300 series, containing around 0.30% or 0.40% carbon, develop mechanical properties superior to those of the lower alloy content nickel-chromium steels, particularly in sections over $3\frac{1}{2}$ inches. They are therefore used extensively for forgings and bars that require rigid mechanical properties, such as large rocker arms and connecting rods. The S.A.E. 3400 series steels exhibit excellent resistance to fatigue, combined with good strength and ductility, which is especially valuable in parts likely to be subject to occasional overstressing from vibration or other causes. A.I.S.I. 3450 is used for heavy-duty gears of medium section in machine-tool construction.

Many nickel-chromium steels have been developed containing small additions of molybdenum, which are more complex steels (*see* table) with outstanding properties. The addition of molybdenum increases depth-hardening properties which makes it possible to develop strength and hardness in large sections equal to those secured in small sizes of other steels. Another characteristic of the nickel-chromium-molybdenum steels that contributes to their usefulness is high-hardness-machinability properties. Some compositions may be machined with Brinell hardnesses exceeding 400. These steels also show high resistance to creep up to about 1,000° F., and find application in valves and fittings in steam power plants. Steels with about 0.55% carbon, 0.65% manganese, 2.00% nickel, 0.90% chromium and 0.20% molybdenum are used for roller bearings where ductility is required along with high hardness and fatigue resistance.

The consumption of contained nickel metal (exclusive of scrap) and chromium metal, consumed in manufacture of steel in the United States in 1952 was 45,000 and 150,000 net tons, respectively. Of this quantity, 60% of the nickel and 67% of the chromium was consumed in stainless steels, leaving 40% and 33%, respectively, for other alloy steels, including nickel-chromium steels.

NICKEL SILVER, comprises a range of alloys of copper, nickel and zinc which are silvery in appearance but contain no silver. Its composition varies from 7% to 30% nickel, the alloy most widely used being "18% nickel silver" (18% nickel, 62% copper, 20% zinc). In general the zinc content is lowered as nickel is increased, the copper content varying between 53% and 63%. The importance of these alloys lies in their colour, ductility, good mechanical properties and suitability for working in a wide variety of cast, rolled and extruded or drawn shapes. The addition of 1%–2% lead improves machining properties. Such alloys resist corrosion better than does brass but tarnish slowly through the action of sulphur in the air. Their colour ranges from nearly white in the 30% alloy to pale brassy yellow in the alloys with low nickel content.

A natural alloy known as paktong (white copper), smelted by the Chinese from copper-nickel ores, was one of the first alloys used by man. It was later improved by the addition of zinc ores and was imported into Europe by the East India company. Not until the 1840s was the alloy made in Europe by mixing the three metals and it was known as German silver until 1914. After an electroplating plant was set up in Birmingham in 1844 German silver was found very suitable as a basis for silver plating.

Nickel silver is used extensively for electroplated table and ornamental silverware (being the base of E.P.N.S.), for jewellery and fancy goods, for architectural and ornamental metalwork, for some food and chemical equipment and for marine and plumbers' fittings. In hard rolled strip form it is used for spring elements, especially in electrical and telephone relays. (P. E. G.)

NICKEL STEEL. Nickel steel was first produced by J. F. Hall of England and M. Marbeau of France about 1885, each working independently. The grades commercially used are an alloy of nickel (0.20%–5.00%), carbon (0.10%–0.60%) and the remainder iron. The primary reason for adding nickel to steel is to increase its strength, toughness, depth hardness, and resistance to fatigue. These properties may be gained with small percentages of nickel (often referred to as an austenite former), which lower the eutectoid ratio (1% of nickel = 0.042% carbon) and tend to suppress transformation of austenite during cooling. In effect this results in

a full-hardened steel with great strength and toughness, even after slow cooling (*see* fig.), which is not possible with ordinary carbon steel. Higher percentages of nickel than those specified above are not used commercially in nickel steel (*see* STAINLESS STEEL) because a martensitic structure, such as 0.40% carbon and 7% nickel, will result which has low elongation and shock-resistant values and is difficult to work and machine.

LEFT: NICKEL STEELS OIL-QUENCHED. RIGHT: CARBON STEELS WATER-QUENCHED

Nickel steel may be produced in the electric or open-hearth furnace in the same manner as carbon steel, except that cleaner scrap is generally used and greater control exercised because of the economic risks. Nickel is not oxidized in the molten bath. It is, therefore, completely recovered from nickel-bearing scrap, and nickel may be added to meet specification early or late during the making of the heat. Nickel steel may be teemed into ingots or castings; and the usual deoxidizer is silicon, which is added in the ladle to about 0.25% of the final chemical analysis of the heat. Ingots are stripped as soon as solidified and placed immediately in soaking pits to prevent cooling cracks. The hot-working temperatures vary slightly from 2,200° F., depending on the chemical composition. Blooms, slabs, plates and shapes are stacked close together and protected from drafts while cooling. Surface imperfections are removed from nickel steel in the semifinished state and in the finished state if permitted by the user.

Industrial Uses.—By using high-strength steel, structures can generally be lightened in weight; for this reason, nickel steels and other alloy steels are widely used in the automotive and railroad industries. It is estimated that the U.S. automotive industry alone consumes 60% of all alloy-steel bar stock used in the country for the production of gears, shafts, roller bearings, nuts, bolts and various forgings. The weight saving over carbon steel by the use of nickel-alloy steel may be as much as 50%. For example, the weight of the entire rear-end assembly of an automobile may be reduced one-half by using smaller axles, housings, and bearings of nickel steel and at the same time be as strong as twice its weight of carbon steel.

In a steam locomotive, nickel steel is used for axles, boiler and

TABLE I.—*Effects of Nickel on Hardness and Low Temperature Strength Using a 0.20% Carbon Normalized Steel*

Nickel (%)	Brinell hardness	Charpy impact resistance in ft.-lb. at	
		Room temperature	-50° F.
0.0	127	80	7
1.0	146	94	30
2.0	155	88	35
3.0	168	88	40
4.0	187	75	50

firebox plate, and frame casting. In the diesel it is used for gears, generator roof and side sheets, and frame. In marine propulsion, such steels are used for shafts and in reduction-gear assemblies. In aircraft it is used for landing-gear parts and power-transmitting parts of reciprocating engines. Nickel steel was chosen for the forging of the world's largest supersonic wind tunnel at the air force research centre at Tullahoma, Tenn., with the following composition 0.28% carbon, 0.65% manganese, 2.85% nickel, 0.35% molybdenum and 0.07% vanadium. Nickel steel has also been used in long-span bridges to reduce dead weight and increase the pay load (for example, the George Washington bridge across the Hudson river at New York city and the San Francisco-Oakland bridge). Although the greater portion of nickel steel is employed for rolled or forged products, a generous quantity is used for castings. Cast-nickel alloys also respond to heat treatment and give high values for strength and hardness. A few uses are railroad passenger-car truck frames, rolling-mill rolls, heavy-cast machinery gears, crusher-jaw castings, impact hammers, and power shovels.

One of the outstanding characteristics of nickel steels is resistance to embrittlement at low temperatures, for which reason it is utilized in chemical equipment for subzero operations. This fact, plus the effect of nickel on hardness, is shown in Table I.

Table II illustrates the wide range of these steels used in the United States.

Steel A is an inexpensive water or oil hardening steel for parts of moderate importance, steel B can be oil-quenched direct from the carburizing heat for a tough core and file-hard case; it has good machining properties and is widely used for roller bearings, gears, piston pins, and drive shafts. Steel C usually is given a more elaborate heat treatment for a strong, tough core; it is used for gears, shafts, and machine parts requiring extra toughness as well as surface hardness and constancy of dimension. Steel D is hard to work but after proper case hardening gives parts having extreme hardness and resistance to shock; examples are aircraft en-

TABLE II.—*Range of Analyses of Nickel-Bearing Steels*

	Low-nickel		Medium-nickel	High-nickel
	A (%)	B (%)	C (%)	D (%)

gines, crankshafts, truck, bus and tractor transmission, and differential gears.

Great strides had been made by the 1950s in finding substitutes for nickel in steel. Manganese, boron and nitrogen had been proved possible substitutes. Many high-nickel alloys had been developed containing up to 95% nickel that are widely used today. Some of these are lead in wire for light globes and radio tubes, thermocouples, low-coefficient-of-expansion material, alloys that resist chemicals and other corrosive mediums, and magnets.

NICOBAR ISLANDS, a group of 12 inhabited and 7 uninhabited islands in the Bay of Bengal, between Sumatra and the Andaman Islands (*q.v.*). The Andaman and Nicobar Islands together constitute a chief commissioner's territory of the republic of India. The aggregate area of the Nicobars is 635 sq.mi., Great Nicobar (*Loöng*), the largest and southernmost of any size, covering 333 sq.mi. Principal of the central group of islands are Camorta and Nankauri (Nancoury), between them being a landlocked shelter called Nankauri harbour. Chief island of the northern group is Car Nicobar (*Pu*), area 49 sq.mi., on which is the headquarters of the administration. Some of the islands have mere flat coral-covered surfaces; others, again, are hilly, the Great Nicobar rising to 2,105 ft. On that island there are considerable and beautiful streams, but the others generally are badly off for

fresh surface water. The marine surveys of these islands are still meagre and unsatisfactory. In 1951 the inhabitants of the Nicobar Islands numbered 12,009, Car Nicobar being by far the most densely populated island.

Geology and Climate.—The Nicobars form part of a great submarine chain, of which the Andamans are a continuation. Elaborate geological reports were issued by a Danish scientific expedition in 1846 and an Austrian expedition in 1858. H. Rink of the Danish expedition considered that the islands belong to the Tertiary age. The Baron von Hochstetter of the Austrian expedition classified the most important formations thus: eruptive, serpentine and gabbro; marine deposits, probably late Tertiary, consisting of sandstones, slates, clay, marls, and plastic clay; recent corals. He considered the whole group connected geologically with the great islands of the Malay archipelago farther south. Earthquakes of great violence were recorded in 1847 and 1881 (with tidal wave), and mild shocks were experienced in Dec. 1899.

The climate is unhealthy. The islands are exposed to both monsoons, and smooth weather is only experienced from February to April, and in October. Rain falls throughout the year, generally in sharp, heavy showers. The rainfall varies from 90 to 135 in., and the shade temperature from 64° to 92° F.

Flora and Fauna.—The vegetation of the Nicobars has not been subjected to a systematic examination by the Indian forest department like that of the Andamans, and indeed the forests are inferior in economic value to those of the more northerly group. There are fruit trees, such as the coconut (*Cocos nucifera*), the betel nut (*Areca catechu*), and the Nicobar breadfruit (*Pandanus leram*), a thatching palm (*Nipa fruticans*) and various timber trees of some commercial value, but only one timber tree (*Myristica irya*) would be considered first class in the Andamans. The palms of the Nicobars are exceedingly graceful.

The mammals are not numerous: in the southernmost islands are a small monkey, the crab-eating macaque (*Macaca irus*), a tree shrew (*Tupaia nicobarica*), rats and mice, bats and the Nicobar flying fox. It is doubtful if the wild boar is indigenous; cattle, when introduced and left, have speedily become "wild." The birds, of which there are many kinds, show strong Indian affinities. Notable among those found in the islands are the megapode (*Megapodius nicobaricus*) characteristic of the Australian region, the edible-nest-building swift, the hackled and pied pigeons, a parakeet (*Palaeornis caniceps*) and an oriole. Snakes, lizards and chameleons, crocodiles, turtles and an enormous variant of the edible Indian crab are numerous; butterflies and other insects have not yet been systematically collected. The fresh-water fish are reported to be of the types found in Sumatra.

History.—The situation of the Nicobars along the line of a very ancient trade route has caused them to be reported by traders and seafarers through all historical times. In the 17th century the islands began to attract the attention of missionaries. At various times France, Denmark, Austria and Great Britain all had more or less obscure rights to the islands, the Danes being the most persistent in their efforts to occupy the group, until in 1869 they relinquished their claims in favour of the British, who at once began to put down the piracies of the islanders, and established a penal settlement, which was withdrawn in 1888. Car Nicobar in the north and Camorta in the centre are the principal ports of the group.

In 1942, during World War II, the Nicobar Islands were occupied by Japanese forces, who developed Car Nicobar as a big supply base. In 1945 the islands were reoccupied by the Allies.

(X.)

Ethnology.—The Nicobarese are probably a mixture of Malay and Burmese (Talaing) strains, with a more primitive element now represented by the Shom Pen of the interior of Great Nicobar. They are of relatively short stature (average height of adult male, 5 ft. 3¾ in.) and sturdy build; hair may be slightly wavy or curly, scanty on face and body; brachycephaly is usual. The language, which has several dialects, belongs to the Mon-Khmer group.

The political unit is the village. There are hereditary headmen who govern with a council of elders; the power of the headman depends on his personality, and public opinion is the final arbiter. Land is held by the community, but there is private ownership of fruit and coconut trees. The status of women is high; they inherit and own property, and girls have considerable freedom in the choice of a husband. The marriage tie is loose, and separation (which ends the marriage) is frequent. Polygamy is rare and is confined to the rich.

Clothing is scanty. Men wear a belt and a cloth perineal band with a tail behind, perhaps connected with one of their stories of origin—that they are descended from a man who mated with a bitch. Articles of European clothing are now often worn. Houses vary in shape; they are built on piles, with thatched roofs and are reached by a notched pole. Much cooking is done in them on clay hearths, but there are also separate cookhouses. Special houses are built by communal labour for feasts and meetings. The coconut is the main crop and yams and other vegetables are grown; fish, turtles, pigs and fowl are also important in the diet. Crossbows are used for shooting birds, spears for hunting pigs, spears, nets, traps and poison for fish, harpoons for turtles. The dao (half sword, half chopper) is the universal tool. Canoes are single outriggers with dugout hulls.

The concept of a beneficent creator is known, probably due to missionary influence. The indigenous religion consists in belief in a multiplicity of spirits, many of them those of ancestors, who may be friendly (locally) or more frequently malevolent. The latter bring disease and misfortune. There is a class of mediums who can communicate with, and control, the spirits; those causing sickness may be caught and towed out to sea in model boats. Grotesque carvings of aggressive mien are kept in houses to scare away evil spirits. Men can acquire reputations as sorcerers by eccentric behaviour, such as sitting in pig wallows and collecting bristles; they are much feared, and are sometimes killed.

The natives of Chowra act as middlemen for the group. They alone make pottery, with clay obtained from Teressa, and exchange it for canoes made in the southern and central islands, which they trade to the north. Chowra men go to Nankauri to burn shells for lime (used in betel chewing), paying in pots for the privilege.

NICOLAI, CHRISTOPH FRIEDRICH (1733–1811), German author and bookseller, was born on March 18, 1733, at Berlin, son of the well-known bookseller, Christoph Gottlieb Nicolai (d. 1752).

In 1749 he went to Frankfurt-on-Oder to learn his father's business, finding time also to become acquainted with English literature. In 1752 he returned to Berlin, and began to take part in literary controversy by defending Milton against the attacks of J. C. Gottsched.

Nicolai's *Briefe über den jetzigen Zustand der schönen Wissenschaften in Deutschland,* published anonymously in 1755 and reprinted by G. Ellinger in 1894, were directed against both Gottsched and Gottsched's Swiss opponents, Johann Jakob Bodmer and Johann Jakob Breitinger; his enthusiasm for English literature won for him the friendship of Gotthold Lessing and Moses Mendelssohn. In association with Mendelssohn he established in 1757 the *Bibliothek der schönen Wissenschaften;* and with Lessing and Mendelssohn *Briefe, die neueste Literatur betreffend* (1759); from 1765 to 1792 he edited the *Allgemeine deutsche Bibliothek.* The *Bibliothek* served as the organ of the so-called "popular philosophers," who warred against authority in religion, and against what they conceived to be extravagance in literature, and Nicolai showed a complete incomprehension of the new movement of ideas represented by Johann von Herder, Goethe, Schiller, Kant and Fichte.

Of Nicolai's independent works, perhaps the only one with some historical value was his *Anekdoten von Friedrich II* (1788–92). His romances were forgotten, although *Das Leben und die Meinungen des Herrn Magister Sebaldus Nothanker* (1773–76) and his satire on Goethe's Werther, *Freuden des jungen Werthers*

(1775), had a certain reputation in their day. Between 1788 and 1796 Nicolai published in 12 volumes a *Beschreibung einer Reise durch Deutschland und die Schweiz,* which bore witness to the narrow conservatism of his views in later life. He died in Berlin on Jan. 11, 1811.

See his *Bildniss und Selbstbiographie* ed. M. S. Löwe in the *Bildnisse jetzt lebender Berliner Gelehrter,* in 1806. *See* also L. F. G. von Göckingk, *F. Nicolai's Leben und literarischer Nachlass* (1820); J. Minor, *Lessings Jugendfreunde,* in J. Kürschner's *Deutsche Nationallitteratur,* vol. lxxii. (1883); M. Sommerfeld, *F. Nicolai und der Sturm und Drang* (Halle, 1921).

NICOLAÏ, OTTO (1810–1849), German composer, was born on the 9th of June in Königsberg. He studied music in Berlin and in 1833 became organist to the German embassy in Rome. There his operas *Enrico II.* (1839) and *Il Templario* (1840) were produced, besides some church music, a series of songs, and a number of compositions for the pianoforte. He was Kapellmeister of the court opera in Vienna from 1841 to 1847, when he was appointed Hof Kapellmeister at the Berlin Opera House. There, only two days before he died (on the 11th of March, 1849), was performed his famous opera, *The Merry Wives of Windsor.*

NICOLAS, SIR NICHOLAS HARRIS, G.C.M.G., 1840 (1799–1848), English antiquary, fourth son of John Harris Nicolas (d. 1844), was born at Dartmouth on the 10th of March 1799. Having served in the navy from 1812 to 1816, he studied law and was called to the bar at the Inner Temple in 1825. His work as a barrister, however, was confined principally to peerage cases before the House of Lords, and his time was mainly devoted to genealogical and historical studies. He died near Boulogne on Aug. 3, 1848.

The most important of the works of Nicolas is his *History of the Orders of Knighthood of the British Empire; of the Order of the Guelphs; and of Medals, Clasps, etc., for Naval and Military Services* (1841–42).

See E. S. P. Haynes, *Personalia* (1918).

NICOLAUS DAMASCENUS, Greek historian and philosopher of Damascus, flourished in the time of Augustus and Herod the Great, with both of whom he was on terms of friendship. He instructed Herod in rhetoric and philosophy, and had attracted the notice of Augustus when he accompanied his patron on a visit to Rome. Later, when Herod's conduct aroused the suspicions of Augustus, Nicolaus was sent on a mission to bring about a reconciliation. He survived Herod, and it was through his influence that the succession was secured for Archelaus; but the date of his death, like that of his birth, is unknown. Fragments of his universal history (Ἱστορία καθολική), from the time of the Assyrian empire to his own days, his autobiography, and his life of Augustus (Βίος Καίσαρος) have been preserved, chiefly in the extracts of Constantine Porphyrogenitus.

Fragments in C. Müller, *Fragmenta historicorum Graecorum,* iii.; *see* also F. Navet, *Nikolaus von Damascus* (1853), containing an account of his life and writings, and translation of the fragments.

NICOLAUS OF LYRA (*c.* 1265–1349), French commentator, was born in Lire, now Vieille-Lyre (Eure). He entered the Franciscan order at Verneuil about 1300, and studied at Paris, where, becoming a doctor some time before 1309, he taught for many years. From 1319 he was provincial of his order in France, and was present in that capacity at the general chapter at Pérouse (1321). In 1325 he was provincial of Burgundy, and as executor of the estate of Jeanne of Burgundy, widow of King Philip VI., he founded the college of Burgundy at Paris, where he died in the autumn of 1349, being buried in the chapter hall of the convent of the Cordeliers.

Among the authentic works of Nicolaus of Lyra are: (1) two commentaries on the whole Bible, one (*Postilla litteralis,* 1322–31) following the literal sense, the other (*Postilla mystica seu moralis,* 1339) following the mystic sense. There are numerous editions (Rome, 1471–72; Douai, 1617; Antwerp, 1634). (2) *Tractatus de differentia nostrae translationis* (*i.e.,* Vulgate) *ab Hebraica veritate,* 1333. (3) Two treatises against the Jews. (4) A theological treatise on the Beatific Vision, directed against pope John XXII. (1334), unpublished. (5) *Contemplatis de vita S. Francisci,* a book of devotions.

In addition to the notices in Wadding, du Moustier, Sbaraglia and Fabricius, *see* C. Siegfried, in *Archiv. f. wissenschaftliche Erforschung des A.T.,* vols. i., ii.; A. Merx, *Die Prophetie des Joel und ihre Ausleger* (1879, pp. 305–366); M. Fischer in *Jahrbücher f. protestantische Theologie,* xv.; F. Maschkowski, in *Zeitschrift f. alttestamentliche Wissenschaft,* xv.; Neumann in *Revue des études juives,* vols. 26 and 27; H Labrosse in *Positions des thèses de l'École des Chartes* (1906).

NICOLE, PIERRE (1625–1695), one of the most distinguished of the French Jansenists, was the son of a provincial barrister, and was born at Chartres. Sent to Paris in 1642 to study theology, he soon entered into relations with the Jansenist community at Port Royal (*q.v.*) through his aunt, Marie des Anges Suireau, who was for a short time abbess of the convent. For some years he was a master in the "little school" for boys established at Port Royal, and taught Greek to young Jean Racine, the future poet. With Antoine Arnauld, he acted as general editor of the controversial literature put forth by the Jansenists. He had a large share in collecting the materials for Pascal's *Provincial Letters* (1656); in 1658 he translated the *Letters* into Latin, under the pseudonym of Nicholas Wendrock. In 1664 he himself began a series of letters, *Les Imaginaires,* intended to show that the heretical opinions commonly ascribed to the Jansenists really existed only in the imagination of the Jesuits. His letters being violently attacked by Desmaretz de Saint-Sorlin, an erratic minor poet who professed great devotion to the Jesuits, Nicole replied to him in another series of letters, *Les Visionnaires* (1666). In the course of these he observed that poets and dramatists were no better than "public poisoners."

About the same time Nicole became involved in a controversy about transubstantiation with the Huguenot Claude; out of this grew a massive work *La Perpétuité de la foi de l'église catholique touchant l'eucharistie* (1669), the joint effort of Nicole and Antoine Arnauld. But Nicole's most popular production was his *Essais de morale* (14 vols., 1671 *seq.*), a series of short discussions on practical Christianity. In 1679, on the renewal of the persecution of the Jansenists, Nicole was forced to fly to Belgium in company with Arnauld. But the two soon parted. Nicole was elderly and in poor health; the life of a fugitive was not to his taste, and he complained that he wanted rest. "Rest," answered Arnauld, "when you have eternity to rest in!" In 1683 Nicole made a rather ambiguous peace with the authorities, and was allowed to come back to Paris. There he continued his literary labours; he was writing a refutation of the new heresy of the Quietists when death overtook him on Nov. 16, 1695. (*See* PORT ROYAL.)

Several abridgments of the *Essais* exist, notably a *Choix des essais de morale de Nicole,* ed. Silvestre de Saci (1857).

Nicole's life is told at length in the 4th volume of Sainte Beuve's *Port-Royal.*

NICOLL, ROBERT (1814–1837), Scottish poet, was born on Jan. 7, 1814, at the farm of Little Tullybeltane, in the parish of Auchtergaven, Perthshire. At sixteen the boy was apprenticed to a grocer and wine-merchant at Perth. In 1833 he began to contribute to *Johnstone's Magazine* (afterwards *Tait's Magazine*), and in the next year his apprenticeship was cancelled. In 1836 he became editor of the *Leeds Times.* He died at the house of his friend William Tait, at Trinity, near Edinburgh, on Dec. 7, 1837, in his twenty-fourth year. He had published a volume of *Poems* in 1835; and in 1844 appeared a further volume, *Poems and Lyrics,* with an anonymous memoir of the author by Mrs. C. I. Johnstone. The best of his lyrics are those written in the Scottish dialect.

See P. R. Drummond, *Life of Robert Nicoll, Poet* (1884).

NICOLL, SIR WILLIAM ROBERTSON (1851–1923), Scottish Nonconformist divine and man of letters, was born at Auchindoir, Aberdeenshire, on Oct. 10, 1851, the son of a Free Church minister. He graduated M.A. at Aberdeen in 1870, and studied for the ministry at the Free Church college there until 1874, when he was ordained minister of the Free church at Dufftown. Three years later he moved to Kelso, and in 1884 became editor of the *Expositor.* In 1886 he founded the *British Weekly,* a Nonconformist organ which obtained great influence over opinion in the free churches. Robertson Nicoll helped to make the fortunes of the paper by the papers which he contributed over the signature of "Claudius Clear." He also founded and edited the *Bookman* (1891, etc.), and acted as chief literary adviser to the publishing firm of Hodder and Stoughton. He edited *The*

Expositor's Greek Testament (1897, etc.), and a series of *Literary Lives* (1904, etc.). He was knighted in 1909 and died on May 4, 1923. *See* T. H. Darlow, *William R. Nicoll* (1925).

NICOLLS, RICHARD (1624–1672), American colonial governor, was born probably at Ampthill, Eng., in 1624. He commanded a royalist troop of horse during the Civil War and on the defeat of the king went into exile. Soon after the Restoration he entered the service of the duke of York, through whose influence he was appointed in 1664 on a commission to conquer New Netherland from the Dutch and to regulate the affairs of the New England colonies and settle disputes among them. The expedition set sail from Portsmouth on May 25, 1664, and New Amsterdam was surrendered to Nicolls on Sept. 8. Under authority of a commission from the duke of York, Nicolls assumed the position of deputy governor of New Netherland (New York). His policy was vigorous but tactful, and the transition to the new regime was made smoothly and with due regard to the interests of the conquered people. The English system of law and administration was at once introduced into Long Island, Staten Island and Westchester, where the English element already predominated, but the change was made much more slowly in the Dutch sections. A code of laws known as the "duke's laws," drafted by the governor with the help of his secretary, Matthias Nicolls (*c.* 1630–87), was proclaimed in 1665 and continued in force until 1683. Nicolls returned to England in the summer of 1668 and continued in the service of the duke of York. He was killed in the naval battle of Southwold bay May 28, 1672.

See J. R. Brodhead, *History of the State of New York,* rev. ed. (1872); Woodrow Wilson, *A History of the American People,* vol. i (1902); M. Schuyler, *Richard Nicolls, First Governor of New York, 1664–1668* (New York, 1933); For the "duke's laws" see *Laws of Colonial New York,* i, 6–100.

NICOMACHUS, a Neo-Pythagorean philosopher and mathematician, born at Gerasa in Arabia Petraea, flourished about A.D. 100. Two treatises by him are extant: (1) The *Introductio arithmetica* sets out the elementary theory and properties of numbers. Numbers are no longer denoted by lines as in Euclid, but are written in the ordinary notation; hence general principles can be stated only with reference to particular numbers taken as illustrations. Nicomachus states a rule about cubes which enables us to sum any number of forms of the series of natural cubes beginning from 1; otherwise the book is mathematically unimportant. It had, however, great vogue ("You count like Nicomachus," says a character in Lucian). A Latin translation by Apuleius of Madaura (born about A.D. 125) is lost; but we have Boëtius' version. The commentators include Iamblichus, Heronas, Asclepius of Tralles, Joannes Philoponus and Proclus. The Greek text was edited by R. Hoche (Teubner, 1866) and the commentaries of Iamblichus and Philoponus by Pistelli (Teubner, 1894) and Hoche (Leipzig, 1864, and Berlin, 1867), respectively. There is an English edition by F. E. Robbins and L. C. Karpinski (New York, 1926). (2) The *Enchiridion Harmonices* (edited by Jan in *Musici Scriptores Graeci,* 1895) is on the Pythagorean theory of music. Nicomachus is said to have written *Theologumena arithmetices* (in two books) on the properties of numbers, of which the *Theologumena arithmeticae* edited by Ast (1817) contains no more than fragments, at most. (T. L. H.)

NICOMACHUS, of Thebes, Greek painter, active *c.* 390–340 B.C., was a contemporary of the greatest painters of Greece; Vitruvius observes that if his fame was less than theirs, it was the fault of fortune rather than of demerit. Pliny (xxxv, 108) gives a list of his works, among them a "Rape of Persephone," "Victory in a Quadriga," a group of Apollo and Artemis and the "Mother of the Gods Seated on a Lion." Pliny tells us that he was a very rapid worker and used but four colours.

NICOMEDES I, king of Bithynia (*c.* 278–248 B.C.). He made himself master of the whole country and put to death his brother, who had set himself up as an independent ruler. He enlarged and consolidated the kingdom, founded the city of Nicomedia as the capital and fought successfully for some time with Antiochus of Syria. Nicomedes II, king of Bithynia (149–91 B.C.), was fourth in descent from Nicomedes I. A popular ruler, he adhered steadily to the Roman alliance. His son, Nicomedes III, ruled until 74 B.C.

NICOMEDIA: *see* ISMID.

NICOPOLIS (VICTORY CITY), **ACTIA,** an ancient city of Epirus, founded 31 B.C. by Octavian (Augustus) in memory of his victory over Antony and Cleopatra at Actium. The colony, composed of settlers from many neighbouring towns, succeeded and became the capital of southern Epirus and Acarnania, with the right of sending five representatives to the amphictyonic council. On the spot where Octavian's tent had stood he built a sanctuary to Neptune adorned with beaks of captured galleys, and instituted the Actian games in honour of Apollo. The city was restored by the emperor Julian and again (after the Gothic invasion) by Justinian, but in the middle ages it was supplanted by Prevesa. The ruins, now known as Palaeoprevesa (Old Prevesa), lie about 3 mi. N., on a small bay at the narrowest part of the peninsula which separates the Gulf of Arta (Sinus Ambracius) from the Ionian sea. The most conspicuous objects are the acropolis, two theatres and an aqueduct.

NICOSIA, the capital of Cyprus, situated in the north central part of the island. Pop. (1946) 34,485; (1951 est.) 39,000. Its earliest name was Ledra, but Leucos, son of Ptolemy Soter (280 B.C.), is said to have changed its name to Leucotheon, corrupted into mediaeval Greek Leucosia and Frankish Nicosia. A mile southwest of the town lies the very large Bronze Age necropolis known as Hagia Paraskevi. The principal monuments of the Lusignan period are the fine Gothic cathedral of St. Sophia, now a mosque, and the church of St. Catherine, now the Haidar Pasha mosque. Adjoining St. Sophia is an early church, later used as a grain store, mistakenly identified in modern times as the church of St. Nicolas of the English. The Famagusta gate was originally known as Porta Giuliana, named for its builder, the Venetian engineer Giulio Savorgnano. In 1567 he reduced the circuit of the city from 9 mi. to 3, constructing a circular earthwork fortification with 11 heart-shaped bastions. Nicosia was captured by the Turks in 1570 after a famous siege of seven weeks. The weaving of silk and other textiles by hand is of importance. Most of the government offices and English residences are located without the walls. There is a narrow-gauge railway connecting Nicosia with the seaport of Famagusta, 37 mi. distant.

See R. Gunnis, *Historic Cyprus* (Philadelphia and London, 1936).

NICOSIA, city and episcopal see (since 1816), Sicily, It., province of Enna, 21 mi. N. of the railway station of Leonforte (which is 49 mi. W. of Catania), 2,840 ft. above sea level. Pop. (1951) 19,428 (commune). The town retains a mediaeval appearance, with a Norman cathedral and other interesting churches, among them S. Maria Maggiore, with a reredos by Antonio Gagini. A Lombard dialect is still spoken there.

NICOTERA, GIOVANNI (1828–1894), Italian patriot and politician, was born at San Biagio on Sept. 9, 1828. Joining the party of Young Italy he was among the combatants at Naples in May 1848 and was at San Pancrazio with Garibaldi during the defense of Rome. After the fall of Rome he fled to Piedmont, where he organized the expedition to Sapri in 1857, but shortly after his arrival there he was defeated and severely wounded by the Bourbon troops. Condemned to death, but reprieved through the intervention of the British minister, he remained a prisoner at Naples and at Favignana until 1860, when he joined Garibaldi at Palermo. Sent by Garibaldi to Tuscany, he attempted to invade the papal states with a volunteer brigade, but his followers were disarmed and disbanded by Ricasoli and Cavour. In 1862 he was with Garibaldi at Aspromonte; in 1866 he commanded a volunteer brigade against Austria; in 1867 he invaded the papal states from the south, but the defeat of Garibaldi at Mentana put an end to his enterprise. His parliamentary career dates from 1860. During the first ten years he engaged in violent opposition, but from 1870 onward he joined in supporting the military reforms of Ricotti. Upon the advent of the left in 1876, Nicotera became minister of the interior, and governed with remarkable firmness. He was obliged to resign in Dec. 1877, when he joined Crispi, Cairoli, Zanardelli and Baccarini in forming the "pentarchy" in opposition to Depretis, but he only returned to power 13 years later as minister of the interior in the Rudini cabinet of

1891. On this occasion he restored the system of uninominal constituencies and resisted the socialist agitation. He fell with the Rudini cabinet in May 1892, and died at Vico Equense, near Naples, on June 13, 1894.

Bibliography.—V. Giordano, *La Vita ed i discorsi di Giovanni Nicotera* (Salermo, 1878); Mauro, *Biografia di Giovanni Nicotera* (Rome, 1886; German trans., Leipzig, 1886); and Mario, *In memoria di Giovanni Nicotera* (Florence, 1894).

NICOTIANA, a genus of plants of the nightshade family (Solanaceae), comprising about 45 species of herbs and shrubs, native chiefly to tropical America. They are strongly scented, annuals or perennials, possessing narcotic poisonous properties. They have alternate, simple, usually entire but sometimes wavy-margined, large leaves, and white, yellow, greenish or purple, fragrant flowers, with a long, tubular, five-lobed corolla, usually opening at night. Besides *N. Tabacum*, important as the source of commercial tobacco (*q.v.*), several other species are cultivated as ornamental plants. Some ten species are found in the southern and western parts of the U.S., *N. glauca* (tree tobacco) a slender evergreen shrub native to Brazil, has become widely naturalized on the Pacific coast. *N. rustica,* one of the plants known as wild tobacco, formerly cultivated by the Indians of the eastern states, is of uncertain origin, but is thought to be the source of the first tobacco taken from tropical America to Europe, and popularized by John Nicot, for whom the genus was named.

NICOTINE, a volatile liquid, is the principal alkaloid (*see* Alkaloids) of tobacco, in which it occurs to the extent of 4% to 5% along with minute amounts of closely related alkaloids. Nicotine is still used in medicine to a small extent, but the principal demand for it is as a horticultural insecticide. It is prepared by adding lime or caustic soda to a filtered, concentrated, aqueous extract of tobacco (stalk and other tobacco refuse is generally used) and recovering the alkaloid so set free, by extraction with a suitable solvent or by steam distillation. This crude alkaloid is freed from water by a chemical drying agent, such as solid potash, and then fractionally distilled. Pure nicotine, $C_{10}H_{14}N_2$, is a highly poisonous colourless liquid, with an unpleasant odour; it boils at 246°–247° C., $[\alpha]_D$–168.5°, and is soluble in most solvents including water. The dipicrate crystallizes in short, yellow prisms, melts at 218° C. and is characteristic of the alkaloid. Nicotine was synthesized in the year 1904 by Pictet, Crepieux and Rotschy.

NICTHEROY, officially Niterói, a city of Brazil and capital of the state of Rio de Janeiro, on the east shore of the Bay of Rio de Janeiro, opposite the city of that name. Population (1950) 174,535; (*municipio,* 190,147). A railway connects the city with the interior, with Macae, on the coast, and with the lines of Minas Gerais. Niterói is practically a residential suburb of Rio de Janeiro. It occupies, in great part, the low alluvial plain that skirts the shores of the bay and fills the valleys between numerous low wooded hills. The site is shut off from the seacoast by a range of high rugged mountains. The shore line of the bay is broken by large, deeply indented bays.

The city consists of a number of these partially separated districts—Praia Grande, São Domingos, Icaraí, Jurujuba, Santa Rosa, São Lourenço, Ponta d'Areia and Barreto—all together covering 8 or 9 mi. of the shore. An electric street railway connects all the outlying districts with the ferry stations of Praia Grande and São Domingos. The city is characteristically Portuguese in the construction and style of its buildings—low, heavy walls of broken stone and mortar, plastered and coloured outside, with an occasional facing of glazed Lisbon tiles, and covered with red tiles. Among the public buildings are several churches and hospitals (including the Jurujuba yellow-fever hospital and the Barreto isolation hospital), the government palace, a municipal theatre and a large Salesian college situated in the suburbs of Santa Rosa on an eminence overlooking the lower bay. Several large islands fill the upper bay near the eastern shore; some are used as coal deposits for the great steamship companies, and one (Flores) is used as an immigrants' depot. Manufactures include cotton and woollen fabrics, tobacco, spirits, soap and tiles.

The first settlement on the east side of the Bay of Rio de Janeiro dates from 1671, when a chapel was erected at Praia Grande, in the vicinity of an Indian village. The settlement did not become a village until 1819, when it was named Villa Real da Praia Grande. In 1834 the city and municipal district of Rio de Janeiro were separated from the province, and Praia Grande became the capital of the latter in the following year. In 1836 it was raised to the dignity of a city and received the appropriate name of Niterói, from the Indian name *Nyterõi,* "hidden water." In the naval revolt of 1893–94 the older districts of the city suffered much damage from desultory bombardments, but the insurgents were too few to take possession. Soon afterward the seat of government was removed to Petrópolis, but restored in 1903.

NIDAROS: *see* Trondhjem.

NIEBUHR, BARTHOLD GEORG (1776–1831), German statesman and historian, son of Karsten Niebuhr (*q.v.*), was born at Copenhagen on Aug. 27, 1776. After studying at the university of Kiel, he became private secretary to Count Schimmelmann, Danish minister of finance, but in 1799 entered the state service. He was chief director of the national bank from 1804 to 1806 when he took a similar appointment in Prussia. He accompanied the Prussian government to Königsberg, where he rendered considerable service in the commissariat, and was afterward still more useful as commissioner of the national debt and by his opposition to ill-considered schemes of taxation. In 1810 he was made royal historiographer and professor at Berlin university, and two years later published two volumes of his *Römische Geschichte* (Eng. trans., 1847–51). In 1816, while on his way to Rome to take up the post of ambassador, he discovered in the cathedral of Verona the long-lost *Institutes* of Gaius, afterward edited by Savigny, to whom he communicated the discovery under the impression that he had found a portion of Ulpian. During his residence in Rome Niebuhr discovered and published fragments of Cicero and Livy, aided Cardinal Mai in his edition of Cicero *De Republica,* and shared in planning the great work on the topography of ancient Rome by von Bunsen and Platner (1773–1855), to which he contributed several chapters. In 1823 he resigned the embassy and established himself at Bonn, where he died on Jan. 2, 1831.

Niebuhr's *Roman History,* to which he added a third volume (1832), counts among epoch-making histories both as marking an era in the study of its special subject and for its momentous influence on the general conception of history. "The main results," says Leonhard Schmitz, "arrived at by the inquiries of Niebuhr, such as his views of the ancient population of Rome, the origin of the plebs, the relation between the patricians and plebeians, the real nature of the ager publicus, and many other points of interest, have been acknowledged by all his successors." He was the first to deal with the ancient history of Rome in a scientific spirit and introduced new principles into historical research. He suggested the theory of the myth; he brought in inference to supply the place of discredited tradition and showed the possibility of writing history in the absence of original records; he drew attention to the importance of ethnological distinctions, and laid stress on institutions, and social traits to the neglect of individuals.

Bibliography.—Niebuhr's *Politische Schriften* ed. by G. Küntzel in 1923 and his *Briefe* by D. Gerhard (1926 *et seq.*); D. Hensler, *Lebensnachrichten über B. G. Niebuhr, aus Briefen desselben und aus Erinnerungen einiger seiner nächsten Freunde* (3 vol., 1838–39, Eng. trans. 1852); J. Classen, *B. G. Niebuhr, eine Gedächtnisschrift* (1876), G. Eyssenhardt, *B. G. Niebuhr* (1886); J. E. Sandys, *History of Classical Scholarship* (1908), iii; C. Seitz, *L'historien Niebuhr* (1909).

NIEBUHR, KARSTEN (1733–1815), German traveller, was born at Lüdingworth, Lauenburg, Holstein, on March 17, 1733, the son of a farmer. He worked as a peasant in his early years, but managed to learn surveying. In 1760 he was invited to join the expedition which was being sent out by Frederick V of Denmark for the scientific exploration of Egypt, Arabia and Syria. He studied mathematics and Arabic for a year and a half before the expedition set out. The expedition sailed in January 1761, and, landing at Alexandria, ascended the Nile. Proceeding to Suez, Niebuhr visited Mount Sinai, and in October 1762 the expedition sailed from Suez to Jeddah, journeying thence overland to Mocha. Here in May 1763 the philologist of the expedition, van Haven, and the naturalist Forskål, died. Sana, the capital

of Yemen, was visited, but the remaining members of the expedition were obliged to return to Mocha. Niebuhr saved his life and restored his health by adopting native dress and food. From Mocha the ship sailed to Bombay; the artist of the expedition and the surgeon died. Niebuhr was now the only surviving member of the expedition. He stayed fourteen months at Bombay, and then returned home by Muscat, Bushire, Shiraz and Persepolis, visited the ruins of Babylon, and thence went to Baghdad, Mosul and Aleppo. After a visit to Cyprus he toured Palestine, crossing Mount Taurus to Brussa, reaching Constantinople in February 1767 and Copenhagen in the following November. He married in 1773, and held a post in the Danish military service and lived at Copenhagen. In 1778 he accepted a position in the civil service of Holstein, and went to reside at Meldorf, where he died on April 26, 1815.

He published *Beschreibung von Arabien* (1772); *Reisebeschreibung von Arabien und anderen umliegenden Ländern* (2 vols., 1774–78) besides papers in *Deutsches Museum.* He also edited Forskål's *Descriptiones animalium, Flora Aegyptiaco-Arabica,* and *Icones rerum naturalium* (1775–76).

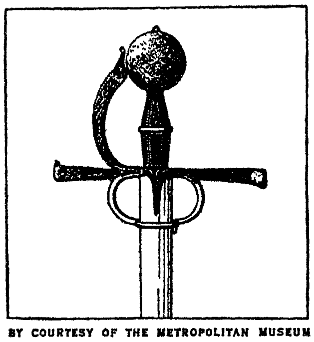
French and Dutch translations of his narratives were published during his lifetime, and a condensed English translation, by Robert Heron, of the first three volumes in Edinburgh (1792). His son Barthold (*see* above) published a short *Life* at Kiel in 1817; an English version was issued in 1838 in the *Lives of Eminent Men,* published by the Society for the Diffusion of Useful Knowledge. *See* D. G. Hogarth, *The Penetration of Arabia* ("Story of Exploration" series) (1904).

NIEDERWALD, a broad hill in Germany, in the province of Hesse-Nassau, opposite Bingen, forming the south-western apex of the Taunus range (*q.v.*). Its summit is clothed with dense forests of oak and beech, while its southern and western sides, which descend sharply to the Rhine, are covered with vineyards. On the hill above Rüdesheim, stands the national monument of the war of 1870–71. Cog railways run up the hill.

NIEHAUS, CHARLES HENRY (1855–1935), American sculptor, was born at Cincinnati, O., on Jan. 24, 1855. He was a pupil of the McMichen school of design, Cincinnati, and also studied at the Royal Academy, Munich, returning to America in 1881. In 1885, after several years in Rome, he established his studio in New York city. In 1906 he became a National Academician. His principal works are a statue of President Garfield, for Cincinnati; the Hahnemann memorial, in Washington; "Moses" and "Gibbons," for the congressional library, and "James A. Garfield," "John J. Ingalls," "William Allen" and "Oliver P. Morton," for Statuary hall, the Capitol, Washington; "Hooker" and "Davenport," State House, Hartford, Conn.; the Astor memorial doors, Trinity church, New York; "General Forrest," Memphis, Tenn.; Generals Sherman and Lee, and William the Silent; "The Scraper, or Greek Athlete using a Strigil"; statues of Lincoln, Farragut and McKinley, at Muskegon, Mich.; a statue of McKinley and a lunette for McKinley's tomb, at Canton, O.; "The Driller," at Titusville, Pa., in memory of Col. E. L. Drake, who, in 1859, originated the petroleum industry of America; "Francis Scott Key," at Baltimore; and the war memorials at Newark and Hackensack, N.J.

NIEL, ADOLPHE (1802–1869), marshal of France, was born at Muret on Oct. 4, 1802, and entered the École Polytechnique in 1821, whence he passed to the engineer school at Metz, becoming lieutenant in the Engineers in 1827 and captain in 1833. He served with distinction in Algeria and in the Crimean War. Niel commanded the IV. corps in the war against the Austrians. (*See* ITALIAN WARS.) On the field of battle of Solferino he was made a marshal of France. After service in a home command, he became minister of war (1867). He drafted and began to carry out a far-reaching scheme of army reform, based on universal service and the automatic creation of large reserves. He also rearmed the whole of the army with the chassepôt rifle. He died on Aug. 13, 1869, in Paris.

NIELLO (the Italian form of Lat. *nigellum,* diminutive of *niger,* "black"), a method of producing delicate and minute decoration on a polished metal surface by incised lines filled in with a black metallic amalgam. In some cases it is very difficult to distinguish niello from black enamel; but the black substance differs from true enamel in being metallic, not vitreous. Our knowledge of the process and materials employed in niello-work is derived mainly from four writers, Eraclius the Roman (a writer probably of the 11th century), Theophilus the monk, who wrote in the 12th or 13th century, and, in the 16th century, Benvenuto Cellini and Giorgio Vasari. The design was cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold or even bronze. An alloy was formed of two parts silver, one-third copper and one-sixth lead; to this mixture, while fluid in the crucible, powdered sulphur in excess was added; and the brittle amalgam, when cold, was finely pounded, and sealed up in large quills for future use. A solution of borax to act as a flux was brushed over the metal plate and thoroughly worked into its incised lines. The powdered amalgam was then shaken out of the quills on to the plate, so as to cover completely all the engraved pattern. The plate was now carefully heated over a charcoal fire, fresh amalgam being added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid, so as to fill all the lines, the plate was allowed to cool, and the whole surface was scraped, so as to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all the nielloed plate was very highly polished, till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silver work on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello, and became a distinct black line, ornament of the most minute and refined description could easily be produced.



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

VENETIAN SWORD HILT OF THE EARLY 16TH CENTURY

The earliest specimens of niello belong to the Roman period. Two fine examples are in the British Museum. One is a bronze statuette of a Roman general, nearly 2 ft. high, found at Barking hall in Suffolk. The dress and armour have patterns partly inlaid in silver and partly in niello. The dark tint of the bronze rather prevents the niello from showing out distinctly. This statuette is apparently a work of the 1st century. The other example is not earlier than the 4th century. It is a silver casket or lady's toilet box, in which were found an ampulla and other small objects, enriched with niello-work.

From Roman times till the end of the 16th century the art of working in niello seems to have been constantly practised in some part at least of Europe, while in Russia and India it has survived to the present day. From the 6th to the 12th century a large number of massive and splendid works in the precious metals were produced at Byzantium or under Byzantine influence, many of which were largely decorated with niello; the silver dome of the baldacchino over the high altar of S. Sophia was probably one of the most important of these. Niello is frequently mentioned in the inventories of the treasures belonging to the great basilicas of Rome and Byzantium. The Scala d'Oro in S. Mark's, Venice, 10th century, owes much of its refined beauty to niello patterns in the borders. This art was also practised by Bernward, artist-bishop of Hildesheim (11th century). In France, too, judging both from existing specimens of ecclesiastical plate and many records preserved in church inventories, this mode of decoration must have been frequently applied all through the middle ages: especially fine examples once existed at Notre Dame, Paris, and at Cluny, where the columns of the sanctuary were covered with plates of silver in the 11th century, each plate being richly ornamented with designs in niello. Among the early Teutonic and Celtic races, especially from the 8th to the 11th centuries, both in Britain and other countries, niello was frequently used to decorate the very beautiful personal ornaments of which so many specimens enrich the museums of Europe. The British Museum

possesses a fine fibula of silver decorated with a simple pattern in niello and thin plates of repoussé gold. This, though very similar in design to many fibulae from Scandinavia and Britain, was found in a tomb at Kerch (Panticapaeum). Several interesting gold rings of Saxon workmanship have been found at different times, on which the owner's name and ornamental patterns are formed in gold with a background of niello. One with the name of Ethelwulf, king of Wessex (836–858), is now in the British Museum. Another in the Victoria and Albert Museum has the name of Alhstan, who was bishop of Sherborne from 823 to 867. The metal-workers of Ireland, whose skill was quite unrivalled, practised largely the art of niello from the 10th to the 12th century, and possibly even earlier. Fine croziers, shrines, fibulae and other objects of Irish workmanship, most skilfully enriched with elaborate niello-work, exist in considerable numbers. From the 13th to the 16th century but little niello-work appears to have been produced in England. It is, however, in Italy that the art of niello-work was brought to greatest perfection. During the whole mediaeval period it was much used to decorate church plate, silver altar-frontals and the like. The magnificent frontals of Pistoia cathedral and the Florence baptistery are notable instances of this. During the 15th century, especially at Florence, the art of niello-work was practised by almost all the great artist-goldsmiths of that period. The British Museum possesses the finest existing example of 15th-century German niello. It is a silver beaker, covered with graceful scroll-work, forming medallions, in which are figures of cupids employed in various occupations.

Bibliography.—*The Archaeological Journal* of 1862 (vol. xix., p. 323) has an excellent monograph on the subject, *see* also vol. xii., p. 79 and vol. iv., p. 247; Labarte, *Arts of the Middle Ages* (1855); Texier, *Dictionnaire de l'orfèvrerie*, p. 1822 (Paris, 1857); Lessing, *Collectaneen zur Literatur* (vol. xii., art. "Niellum"); C. Davenport in *Journal of Soc. of Arts*, vol. xlviii. (1901).

NIEM [Nyem, or Nieheim], **DIETRICH OF** (*c.* 1345–1418), mediaeval historian, was born at Nieheim, a small town subject to the see of Paderborn. He became a notary of the papal court of the rota at Avignon, and in 1376 went with the Curia to Rome. Urban VI. made him an abbreviator to the papal chancery. His chief importance lies in the part he took in the controversies arising out of the Great Schism. He accompanied Gregory XII. to Lucca in May 1408, and, having in vain tried to make the pope listen to counsels of moderation, he joined the Roman and Avignonese cardinals at Pisa. He adhered to the pope elected by the council of Pisa (Alexander V.) and to his successor John XXIII., resuming his place at the Curia. In view of the increasing confusion in the Church, however, he became one of the most ardent advocates of the appeal to a general council. He was present at the council of Constance as adviser to the German "nation." He died at Maastricht on March 22, 1418.

Niem's most important works are the *Nemus unionis*, a valuable collection of papal documents; and the *De schismate*, giving the history of events from 1376 to 1410, when he completed the work. It was continued in the *Historia de vita Johannis XXIII.*

For bibliography *see* Potthast, *Bibl. hist. medii aevi* (2nd ed., Berlin, 1896), p. 1,051, *s.v.* "Theodoricus de Niem"; and generally *see* the article on Niem by Theodor Lindner in *Allgemeine deutsche Biographie* (Leipzig, 1886); and Erler, *Dietrich von Nieheim* (Leipzig, 1887).

NIEMCEWICZ (nyĕm-tsä'vĭch), **JULIAN URSIN** (1757–1841), Polish scholar, poet and statesman, was born in 1757. In the earlier part of his life he acted as adjutant to Kosciusko, was taken prisoner with him at the fatal battle of Maciejowice (1794), and shared his captivity at St. Petersburg. On his release he travelled for some time in America, where he married. After the Congress of Vienna he was secretary of state and president of the constitutional committee in Poland, but in 1830–31 he was again driven into exile. He died in Paris on the 21st of April 1841. Niemcewicz wrote comedies, novels and historical works, but he is best remembered by his *Historical Songs of the Poles* (Warsaw, 1816), a series of lyrical compositions in which the chief heroes are of the golden age in Polish history.

His collected works were published in 12 vols. at Leipzig (1838–40).

NIEPCE (nē-eps'), **JOSEPH NICEPHORE** (1765–1833), French physicist, and one of the inventors of photography, was born at Châlon-sur-Saône on March 7, 1765. He served in the army and was *administrateur* of the district of Nice from 1795 to 1801. Returning in that year to his birthplace, he devoted himself along with his elder brother Claude (1763–1828) to mechanical and chemical researches. In 1813 the idea of obtaining photographs first suggested itself to him, and in 1827 he succeeded in producing a photograph on a metal plate. Niepce learned that L. J. M. Daguerre was working in the same direction, and in 1829 the two united their forces "pour coopérer au perfectionnement de la découverte inventée par M. Niepce et perfectionnée par M Daguerre" (*see* also Photography). Niepce died at Gras, his property near Châlon, on July 3, 1833.

NIERSTEIN, a village of Germany, in the *Land* of Hesse. on the left bank of the Rhine, 8 m. S. from Mainz by the railway to Worms. Pop. (1933) 4,807. Nierstein was originally a Roman settlement, and was a royal residence under the Carolingian rulers. Later it passed from the emperor to the elector palatine of the Rhine. It contains an old Roman bath—Sironabad—and sulphur springs. It is famous for its wines.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), German philosopher, born Oct. 15, 1844 at Röcken near Lützen, in the Prussian province of Saxony, came of a family of clergymen. Both his father and his grandfather were Protestant pastors, while his paternal grandmother and his mother, née Oehler, were also pastors' daughters. They were honourable, pious people, cheerful and happy, with a social life embellished by poetry and music; while their official standing secured them from the petty cares of existence. Nietzsche's forbears also enjoyed singular bodily vigour, which they retained in all its freshness to old age. Nietzsche's father, who died prematurely from a fall down a flight of steps, was an exception. In his joy over the birth of a son, this father inserted in the Church register of Röcken at Friedrich's christening the question from Luke i., 66, "what manner of child shall this be?"

Wagner and Schopenhauer.—The boy was educated at Naumburg and at the famous old Fürstenschule of Pforta, which he left with an excellent leaving certificate (with only one "unsatisfactory," in mathematics). In the autumn (1864) he was entered at the University of Bonn, as a student of theology and classical philology. As, however, he found at Bonn an exceptionally gifted teacher of classical philology in Ritschl, he soon, to the great grief of his family, abandoned theology and devoted himself exclusively to philological studies. In fact, the undergraduate Nietzsche severed himself not only from theology but from Christianity; the determining influence in this change was his reading of Schopenhauer, whose great work, *The World as Will and Idea*, had fallen into his hands by accident.

His enthusiasm for Schopenhauer and for music—an art which Nietzsche loved and practised throughout his life—brought him into touch with Richard Wagner, who was then living at Triebschen on the Lake of Lucerne. Nietzsche, as a young student of 25, had, on Ritschl's recommendation, been appointed professor at Basel; and close personal intercourse with Wagner followed. The two men agreed in their judgment of their own time, and in their appreciation of antiquity; Nietzsche combined Wagner's views and his own researches on Greek artistic achievement in *Die Geburt der Tragödie* (1870–71). But the book was severely condemned by the official German school, under the leadership of Ulrich v. Wilamowitz, and Nietzsche as a classical scholar was outlawed.

He clung all the more closely to Wagner, at whose side he waged war against German lack of culture. The four *Unzeitgemässen Betrachtungen*, devoted to this struggle, were intended to restore Germany, whose development Nietzsche felt had been jeopardized by the victories of 1864, '66 and '70, to intellectual pursuits. These four polemical works (1873–76) are entitled *David Strauss, der Bekenner und Schriftsteller; Vom Nutzen und Nachteil der Historie für das Leben; Schopenhauer als Erzieher;* and *Richard Wagner in Bayreuth.*

In working on the last of these, Nietzsche began to be conscious of reservations both on the cultural value of Wagner's creations, and on his personality; during the Bayreuth Festival, these reser-

vations led to estrangement and ultimately to passionate renunciation. (See *Der Fall Wagner, Nietzsche contra Wagner,* 1888.) Nietzsche held that Wagner's art was nothing more than the dope required by a decadent generation, and the whitewashing of Schopenhauer's pessimism. In both his models, Schopenhauer and Wagner, he began to discern tendencies towards Christian and Buddhistic negation, and therefore, though with much pain, broke loose from them. The first expression of this emancipation is found in *Menschliches all-zu Menschliches* (2 vols. 1878), in which Nietzsche enters on his essentially negative critical period. In 1879, probably owing to the pain caused by his violent separation from his friends and masters, Nietzsche's health became so bad that he had to resign his professorship at Basle. Thenceforward, he lived chiefly in northern Italy, the Engadine, or the French Riviera, on the small pension granted him by the university of Basle.

Maturity.—From this time onwards, he devoted himself wholly to philosophy, and with the gradual improvement in his health, entered the third and mature period of his creative life, during which his best works were given to the world. In *Morgenröte* (1880–81) and *Die fröhliche Wissenschaft* (1881–82), he fought romanticism in all its manifestations, and revealed art, religion and philosophy as illusions invented by man as weapons in his struggle for development, for prevailing over himself and his fellows.

In the years 1883–85, he produced work which he himself regarded as his highest achievement. Written in the style of an Old Testament prophet, this work which was his own New Testament, the gospel of the superman and the eternal recurrence, was entitled *Also Sprach Zarathustra. Ein Buch für Alle und Keinen.* Nietzsche provided a valuable interpretation of this work, parts of which even to-day are difficult to understand, in the two volumes of *Jenseits von Gut und Böse* (1885–86) and *Genealogie der Moral* (1887). He then planned a greater work, *Der Wille zur Macht: Versuch zur Umwertung aller Werte.* It was never finished, but contains no less than 1,052 valuable aphorisms: its two volumes (Vols. xiv. and xv. in the English works) are divided into the following sections:—(1) European Nihilism, (2) A Criticism of the Highest Values that have prevailed hitherto, (3) The Principles of a New Valuation, (4) Discipline and Breeding. The three fine and stimulating books, *Götzendämmerung, oder wie man mit dem Hammer philosophiert, Der Antichrist,* and the autobiography *Ecce Homo,* date from his last and exceptionally productive period, the year 1888.

At the turn of the year (1888–89) Nietzsche broke down, probably from overwork; for, outwardly calm as his life had been, the philosopher had suffered most violent moral upheavals, and had moreover recorded his innermost experience in a brief space of time in a number of carefully thought out works. Another cause of his breakdown was probably his extreme loneliness; only in the last year of his conscious life was he "discovered" by the Danish-European critic and author, Georg Brandes; he himself had neither followers nor disciples. We may take him at his word when, on July 8, 1886, he writes to his sister:—"My health is really quite normal—only my soul is so sensitive and so full of longing for good friends of my own kind. Get me a small circle of men who will listen to me and understand me—and I shall be cured." Nietzsche lived on for another 12 years, first with his mother at Naumburg and, after the latter's death, with his widowed sister, Elizabeth Förster-Nietzsche at Weimar, where he died on Aug. 25, 1900. He was buried in the churchyard of Röcken.

The Message.—In order to understand Nietzsche's philosophy, which departs conspicuously from the orthodox and academic, it is necessary once more to make a profound study of his development. Nietzsche, it must be remembered, did not spin his view of life out of his inner consciousness, but lived and suffered it—a fact which explains both his language, free from learned jargon, and his half pathetic, half ironical style, which is yet always so full of poetry and metaphor.

Nietzsche, as we have seen, started his philosophical career with Schopenhauer—the philosopher who took such a gloomy and despondent view of life that, at last, in wrath over his own aversions, he denied the will to life altogether. In the end Nietzsche came to regard Schopenhauer's principal work as the outpourings of a melancholy young man. Its author never fought his way through to cheerful maturity, but remained fettered to the doctrines he had laid down early in life. Nietzsche, whose motto was, "Only he who altereth remains unalterably mine," condemned this lack of capacity for development.

The changes in Nietzsche's own nature took place under the influence of Pre-Socratic antiquity; by this standard he weighed both Schopenhauer's and every other philosophy which either denied or was hostile to life. He saw that pagan antiquity had said "yea" to life; but that there had been, and now existed, other and different judgments and valuations of existence and "things." The attitude of civilization towards existence and "things," depended upon that civilization's values; and values may be either life-promoting or life-arresting.

The Good, The True and The Beautiful.—What are the ruling values of our civilization? Nietzsche replies, the ruling values of our civilization are those of the good, the true and the beautiful; which have ruled for thousands of years. All thinkers, including Plato, have acknowledged them as the highest. Nietzsche condemns these values as life-arresting; they are moreover quite illusory, for there is no instinct for goodness, truth and beauty. What does exist is another instinct—the will to power, the will to a stronger and higher existence. This will to power designates as good, true and beautiful, whatever is useful to the individual, whatever serves his advancement and enables him to establish his type by victory over others and using those others for his ends. Not goodness, truth or beauty *per se* determines what is good, true and beautiful, but something which lies behind goodness, truth and beauty, something which is higher, deeper, more important and more mighty than any of them, and uses "good," "true" and "beautiful," merely as means, as weapons to affirm and promote its own life and the lives of those that are like it—to wit, the will to power.

Good, true and beautiful are therefore not fixed values; they are relative, and there always stands behind them some human type, which by means of them is furthering its own ends. How came they to prevail as absolute values? How came they to prevail to such an extent that ultimately they were imposed upon all? "*Cui bono* were these values proclaimed?" Nietzsche asks. And he replies, "Even these, our present values, are the expression of a will to power—but of the will of the impotent, the humble, the feeble, the subjected, the peaceloving, who by means of these values wished to predominate and—have succeeded."

Our values "good," "true" and "beautiful," which led to Schopenhauer's philosophy and to the gloomy and disintegrated state of the world, came, according to Nietzsche, from the Jews. Among the Jews, the slave people of antiquity, arose the values which, with the help of religion and its moral content, still rule our present-day world. It is true that the Jews themselves once maintained a yea-saying attitude to the world. In the days of their prosperity, when they were still a triumphant and warlike people, ruled by capable kings, they too called "good" everything that was "bold," "vigorous," "joyful," "cruel" and "self-reliant." But ultimately these Jews fell under the heel of various foreign invaders, and their faith in the old natural values declined —but not their will to live, which now they fostered under a table of values and judgments the reverse of those they had formerly held.

Thenceforward they gradually and systematically demonetized "good." They called good all that was "cautious," "clever," "humble," "pacific," "mendacious" and "adaptable"; while their "evil" became everything that was "strong," "hard," "upright," "energetic," "exuberant" and "self-respecting." Thus, in the end, the Jews transvalued all values; thus they corrupted the master morality into the slave morality. "The Jews," says Nietzsche, "performed the miracle of the inversion of valuations; they led the slave-insurrection in morals. Jesus of Nazareth, this 'Redeemer,' bringing salvation and victory to the poor, the sick, the sinful—was he not really temptation in its most irresistible form, tempta-

tion to seize hold of those very Jewish values and new ideals? '*Sub hoc signo*' Israel, with its slave morality, triumphed over the noble ideals of master morality. Under Israel's flag the people have triumphed, or the slaves, or the populace, or the herd, or whatever name you care to give them. The 'masters' have been done away with; the morality of the common man has triumphed."

Levelling.—The Jews thus bequeathed the values of their decadence to Christianity, and the latter, for its part, accentuated them, and spread them all over the world through many centuries of preaching and propaganda. Since the Crucifixion of Christ the noble have only been able to assert themselves for brief periods in Europe; *i.e.*, at the Renaissance, under Louis XIV., and under Napoleon I. They were immediately suppressed by the Reformation, the French Revolution and the so-called Wars of Liberation against the "Corsican invader." All this occurred gradually, without mankind becoming aware of what had happened, so that the world never obtained a clear conception of how thoroughly it had been Semitized.

The 19th, Nietzsche's own century, which he assailed most wrathfully, had, according to him, finally let loose all these Christian instincts. These instincts, in their political disguise, dominate all modern movements—the labour, pacifist and feminist movements. "All distinctions must be removed," is the order of the day, even the natural distinction between man and woman. Yet, according to Nietzsche, the emancipation of woman can lead only to her enfeeblement and the destruction of her charm; and, therefore, only to defective offspring. If healthy children are to be produced, the differences between the sexes should be maintained, even deepened. But modern democracy will have nothing to do with differences, and in this demand is it not the legatee of Christianity? Christianity claims the equality of men before God, democracy, the equality of all men before the law. And as democracy derives from Christianity, so does socialism, which is little more than the Gospel in modern dress. For the Gospel was originally "the announcement that the road to happiness lies open to the poor and lowly—that all that is necessary is emancipation from institutions, tradition, and the tutelage of the ruling classes.

"This Christianity is no more than the typical teaching of the Socialists. Property, acquisition, fatherland, rank and position, courts of law, the police, State, Church, education, art, militarism: all these are so many obstacles in the way of happiness, so many mistakes, snares, and devil's artifices, on which the Gospel passes sentence—all this is typical of socialistic doctrine." (*Der Wille zur Macht,* Aphorism 209.)

The Will to Power.—Is there then no escape from this topsy-turvy world? Is there no hope that other than Semitic values will once again prevail, and that other than "herd" men will be born? Are the "meek and the poor in spirit" always to be allowed to "have their say," and thus continue to "torture" the ears of him who "remembers with a shudder that mankind's fate depends upon the success of its highest types?"

To the anxious enquirer who puts this question, Nietzsche replies:—"Yes, there is a way, but new Gods, or resuscitated old Gods can no longer be of any avail. Our only hope lies in new men." And, according to him, these new men are already in process of formation. "The aspect of the European of to-day," says our philosopher, "makes me very hopeful. A daring and ruler race is building itself up, upon the foundation of an extremely intelligent gregarious mass. . . . The same conditions which go to develop the gregarious animal also force the development of the leaders." (*Der Wille zur Macht,* Aph. 955–56.) "While, therefore, the democratization of Europe will tend to the production of a type prepared for slavery in the most subtle sense of the term, the strong man will necessarily, in individual and exceptional cases become stronger and richer than he has perhaps ever been before. . . . The democratization of Europe is at the same time an involuntary preparation for the rearing of tyrants—taking the word in all its meanings, even in its most spiritual sense.". . .

For Nietzsche saw great dangers threatening both the 20th century and its successor. With them would come the classical era of great wars and revolutions, says this poet-philosopher, who, incidentally, was also a true prophet. In these wars and revolutions (which by-the-bye he only foresaw and did not bring about as Allied War propaganda alleged), he welcomed a means for the masculinization of the world, the rearing of a higher type of man, and the creation of a new ruler caste.

For these, and these alone, he demanded emancipation from the Judaeo-Christian morality. Only to these higher and stronger men, from whom ultimately Superman was to spring, did he grant and recommend his famous formula of the transvaluation of all values:—"The aim should be to prepare a transvaluation of values for a particularly strong kind of man, most highly gifted in intellect and will, and, to this end, slowly and cautiously to liberate in him a whole host of slandered instincts, hitherto held in check: whoever meditates about this problem belongs to us, the free spirits—though not to that kind of 'free spirit' which has existed hitherto: for these desired practically the reverse." (*Der Wille zur Macht,* Aph. 957.) And in the very next aphorism he adds: "I am writing for a race of men which does not yet exist: for the lords of the earth.". . . "Live dangerously!"—this motto, which he himself lived up to, Nietzsche addresses to these future lords of the earth, while gladly conceding to others the right to strive for happiness and safety, and to cultivate domestic virtues. For, in all his writings, the philosopher emphasized that he had set up no moral code for the generality of men, and that he had no wish to lead lesser men away from their virtues and their duties. "I am a law only for mine own; I am not a law for all. He, however, who belongs to me must be strong of bone and light of foot,"—(*Also Sprach Zarathustra*).

The Rejection of Nietzsche.—An aristocratic doctrine like this, addressed to a self-confident democracy, inevitably met in the first place with misunderstanding, or, rather, with silence, then contempt, and finally with rejection. It was rejected all the more firmly, when, despite Nietzsche's warning, many uninvited guests pressed into his garden, and indulged their chaotic and rebellious instincts "beyond good and evil." Nietzsche himself had forseen these unwanted disciples, and had warned the world as follows:—"The first followers of a Creed prove nothing against it." To these false followers, Nietzsche preferred his adversaries, among whom the true believers were by no means the worst.

But those he esteemed least were his former colleagues; for the ears of scholars and university professors were least attuned to his message. To these men, as has been well said, the new teaching was a "bolt from the blue": although even this was not entirely true; for, like every other thinker, Nietzsche of course had his predecessors, whom he expressly mentioned by name—Heraclitus, Empedocles, Spinoza and Goethe.
